VOLUME
TWENTY-TWO

JULY-
DECEMBER

THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD

APPEALING TO THOSE ENGAGED IN

THE ART OF BUILDING.

*IT is our aim, our ambition, our aspiration even,
to build our Journal worthily and well, not
for the hour only, but for future years; for the
few men in the forefront of an enduring and
a laborious Art; for the disciplined ranks of a
distinguished Profession; for the young men—
Architects to be—and for all who love a clustered
column or a flying buttress, a traceried window
or a Greek frieze; for the man, too, who honestly
plumbs a jamb*

6, GREAT NEW STREET, FETTER LANE,

CONTENTS.

AALESUND FIRE, Fire Supp. Sept. 27, p. 32.
Abbey, Tintern, 195.
Abroad, Architects, 71.
Academy Thousands, The, 145.
Accidents, Structural, 115.
Additions to Workshop, 352.
Addresses, American, 183.
Adjoining: Owners and Footings, 168;
Owner, Walls of, 315.
Agreements, Builders', 328.
Air space in Portable House, 199.
Alhambra, Condition of, 166.
Alteration, A Shop, 302.
American: Addresses, 183; Baths, 263;
Schools, Heating of, 241; Methods of
Building, 301.
Anchors, 159.
Ancient: Builder, The, 200; Lights, 168.
Angle of Slope for Coals, 71.
Angoulême, Bordeaux and Périgueux, 40.
Appointment, Government Surveying,
245.
Appointments in H.M. Office of Works,
156.
Apportionments, Paving, 302.
Arbitrators, Architects as, 206.
Arch, Setting-out an Elliptical, 257.
Arch at Chatham, 107.
Archæology, The End of, 57.
Architect: Unfair Charges by, 99; On
becoming an, 163; An Eccentric, 93;
and Client, 203.
Architects: Fees, 131, 168; Fees on
Joinery Work, 83; as Arbitrators, 206;
and their Assistants, 302; boycotted by
Builders, 217; and Machinery, 275; and
Socialism, 126; Statutory Enrolment of,
54; Newer Training of, 29; Irish and
Registration, 33; in Canada, 316; in
South Africa, 201; Society of, 238, 291;
Congress, 287.
Architecture: Examination in, 41; Iron,
15; Women and, 217; New Theories of,
238, 276; Curves in Classic, 262; in
Finistère, 16, 20, 30; in Sweden, 309;
Saxon, 154; Turkish, 319.
Architectural Association: 204, 239, 294,
325, 355; Conversazione, 267; School,
137; Excursion to Lisieux, 88; of Ire-
land, 237.
Architectural: Students' Club, 37, 81;
and Building Events of 1905, Dec.
27th; Refinements, 238, 260, 262; Plan-
ning of Public Buildings, 351; Sculp-
ture, 207; Societies, The, 41.
Area and Air-space in Portable House,
199.
Area of Classrooms in Secondary Schools,
168.
Arrangement of Drawings, 39.
Art Study, Course of, 53.
Articles, 316.
Assessing, Faulty, 247.
Assignment, Deed of, 264.
Assistant: Architect and Surveyor, Office
of Works, 156; The Roaming, 289.
Assistants, Architects and their, 302.
Association of Municipal and County
Engineers, 168.
Athens, The Theseum, 328.
Attendance item in Quantities, 303.
Attics, 179.
Automatic: Fire-alarm Test, Fire Supp.
July 5th, p. 8; Sprinklers, Fire Supp.
Aug. 2nd, p. 11.
Awnings, 29.

BAALBEC, 296.
Bakehouse Chimney, 199.
Baptistry, Small, 315.
Barge-boards, 305.
Barrack Blocks and Stables, 166.
Basements and Ground Floors, 289.
Baths: American, 263; and Bathrooms,
173; at Camberwell, 359; at Hull, 65.
Bats in a Church, 83.
Battlements, 203.
Bed-places, 217.
Belgian Cement, 209.
Beresford Pite on Trafalgar Square, 262.
Bill, Institute Registration, 44.
Black Paint for Drawing Board, 83.
Bloom on Varnish, 179.
Board of Education: Examinations, 341;
Examination in Architecture, 41.
Books on: Masonry, 24; Quantities, 53;
Hydrostatics and Arbitrations, 257;
Architectural Design and Construction,
301; for Assistant Surveyors' Examina-
tion, 341; Stone-working Machinery,
328.
Bordeaux, Périgueux and Angoulême, 40.
Bournemouth Municipal Buildings, 292.

Brattles Grange, 225.
Brick Clay, Firing of, 53.
Bricks: Patent, 220; Price of, 124.
Brickwork: Notes on, 36; Strength of,
228.
Bridge on Old Piles, 352.
Brighton, Alterations at Grand Theatre,
195.
Bristol, Fires at, Fire Supp. Dec. 20th,
p. 54; Fire Supp. Nov. 22nd, p. 46.
Builder, The Ancient, 200.
Builders': Notes, 13, 27, 35, 66, 82, 96,
112, 121, 126, 151, 165, 182, 201, 212, 229,
242, 253, 270, 284, 298, 314, 332, 360;
Finance and Book-keeping, 70; Agree-
ments, 328; Boycott Architects, 217;
Plant, Hire of, 334.
Building: Trade Terms, 168; Trades, 124;

THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

July 5, 1905. Vol. 22, No. 543.

6, Great New Street, Fetter Lane, E.C.

Summary.

The principal feature of the New Mersey Docks and Harbour Board offices at Liverpool is a great central dome, the height of which is 220ft. from pavement level to the top of the cupola. The foundations of the building consist of concrete arched piers resting on a bed of solid rock and carried up to within a few feet of the street level. (Page 2.)

M. Considère has shown that metal employed in the form of bands has, from the point of view of resistance to compression, an efficiency 2·4 times greater than that used in the form of longitudinal reinforcement. Banded pieces prepared in the workshop with all possible care, and made with a very rich concrete and subjected to initial compression, offer a resistance to compression comparable with that of a structure of riveted steel of the same weight, and are less expensive. It is safe, therefore, to prophesy that banded concrete will be able in a large number of cases to replace with advantage the compression members made of rolled steel sections in a large metallic structure. The tension members would consist of bundles of round bars lightly banded and dipped in concrete. The connections would be more easily made than those of other frameworks, and could be reinforced by a supplementary banding. Such structures would have an unlimited life with practically no expense for maintenance. (Page 10.)

There are fine screens with rood lofts in the churches of S. Beuno at Clynog and S. Einion at Llanengan, and that at Llanegryn. (Page 13.)

There is a proposal to erect a statue in memory of the late Duke of Cambridge in the neighbourhood of the Horse Guards, but as yet no site has been selected. (Page 5.)

Students desirous of taking a holiday in Cornwall and doing some sketching should make their headquarters at Fowey, which is on the sea and has an excellent church, and forms a centre for railway excursions to places of architectural interest such as St. Blazey, Bodmin and Padstow, which all contain good examples of ecclesiastical architecture. (Page 12.)

Asked if he could arrange that the materials to be used in the erection of the College of Science in Dublin should be Irish, and that Irish workmen and architects should be employed on public works in Ireland, the Chief Secretary replied that he did not consider it feasible to restrict contractors in the choice of their workmen and materials, but that where practicable preference would be given to Ireland. (Page 5.)

Improving the Marble Arch. ANY attempt to improve the surroundings of our public monuments is worthy of support, and we welcome the suggestion for the improvement of the Marble Arch made, on the occasion of the King's birthday, by Mr. F. W. Speaight, the well-known photographer, of New Bond Street, London. His plan is to construct a large semicircular screen of railings and gates of 360ft. diameter behind the Marble Arch, the object being to make it stand out boldly, as a triumphal arch should do, instead of being crowded in as a mere entrance to the park. Mr. Speaight points out that there is no sentimental case against the change, as the arch was originally intended as a main entrance gateway to Buckingham Palace, and was removed in 1851 to its present site, and that no financial objection could be serious since the cost of acquiring the only private property which would be interfered with, namely, a stable, and the making of the roadways, would only be about £15,000, practically the whole of the land being taken from Hyde Park. The suggestion is certainly worthy of consideration, and Mr. Speaight himself asks for criticism from architects, artists and others who are better able to judge the merits of the scheme, and to suggest the best means of carrying it out. The author unfavourably contrasts the present situation of the Marble Arch with that of the Arc de Triomphe, in Paris, but it should be recollected that his scheme only deals with one aspect of the arch, namely, that to Oxford Street, and leaves the present prospect from the park practically untouched; and in view of this the suggestion of making a new processional road from Constitution Hill and the Mall, with this as a finish, loses its chief argument. The fact that the suggested crescent and screen, if carried out, would be only of advantage looked at from Oxford Street, would require the screen to be of something more impressive than railings and piers. A stone screen or cloister would be better, and we have quite enough bare spaces of gravel, wood blocks or asphalt around our public monuments to urge that in this case floral or grass plots should be adopted. The plan for bringing the screen across Park Lane is also open to objection, because it would force this main traffic road to be swung round sharply at the Oxford Street end, which is anything but desirable. The fact of the matter is that the Marble Arch is not in a good position for any alteration; but as it has been moved once it might be as well to

consider whether it should not be re-erected to face the Edgware Road. One detail of Mr. Speaight's scheme, namely, his suggestion of improving the present type of electric lamp standard by carrying it still higher to 50ft. in the form of a Venetian mast, we do not favour. It looks spidery and dwarfs the surroundings. To place a powerful light high up is not an economical form of illumination; the lamps should be of medium intensity, lower down to the ground, and more numerous, to be effective.

The Glass Combine. THIS is the day of combines. We have had the Shipping Trust, the Imperial Tobacco Co., the Associated Portland Cement Manufacturers, the Wallpaper Manufacturers; and now the movement has reached the glass trade. For several years past British glass manufacturers have received severe competition from Belgian firms, and practically only three English firms have been able to stand the strain. These are Messrs. Pilkington Brothers, Ltd., of St. Helens; Chance Brothers & Co., Ltd., of Birmingham, and the Glasgow Plate Glass Co. It is now stated that these have come to an arrangement with the Belgian manufacturers, who are the only serious rivals to the British firms in Europe, whereby they shall not send to Great Britain or any British colony any rolled plate, muranese, tinted and embossed glass except to the order of the three British firms mentioned, who have presumably undertaken to accept the delivery of a certain proportion of the Belgian output and not to compete against Belgian firms on the Continent. It is said that the agreement is to remain in operation for five years. Further developments are expected in the sheet glass trade. The consequence will be no doubt a rise in the price of glass all round. The quantity of Belgian rolled plate, muranese and cathedral glass imported into this country probably equals if it does not exceed the total output of the three British firms, who cannot supply the home demand, and hence they will be enabled to make considerable profits. Already prices have increased upon those of last year. While prices are kept down to a reasonable figure these combines need expect no rivalry, but if they become exorbitant competition must be expected from other countries. We have heard a good deal about competition from German and American firms in the wallpaper trade, but while prices remain as they are there is little likelihood of this coming to pass.

LIVERPOOL DOCKS OFFICES.

A Huge New Building.

THE new head-offices for the Mersey Docks and Harbour Board, illustrated in this issue, are being erected upon the site of George's Dock, Liverpool, and have a frontage to the river of 264ft. The approximate area occupied by the building is a little over 1½ acres. It is in the Renaissance style and the materials used are Portland stone and grey granite backed with common bricks.

The principal feature of the building is a great central dome, the height of which is 220ft. from pavement level to the top of the cupola. There are also four corner towers, two 143ft. high from the street level, built in grey granite from ground to first floor: these towers will contain the principal entrances coming from the city, and will be approached from the street by a grey granite staircase. The main entrance to the building faces the river front and will have a grey granite staircase leading from the street level to ground floor.

The foundations of the building consist of concrete arched piers resting on a bed of solid rock and carried up to within a few feet of the street level.

Fig. 1 shows the concrete piers at springing level; Fig. 2 the concrete foundations of the central dome; Fig. 3 the commencement of the steelwork to the main building; Fig. 4 the elevation on the south side, showing the early stage of fixing stone. Fig. 5 shows the construction of the steelwork to the central dome, taken on July 28th, 1904; Fig. 6 gives another view of the dome show-

FIG. 3.—VIEW FROM SOUTH-EAST CORNER OF SITE, TAKEN ON MARCH 23RD, 1904, SHOWING THE WORK AT STREET LEVEL.

ing the concrete arching to carry masonry, and Fig. 7 shows the steel construction of the dome; Fig. 8 shows the detail of the steelwork to the cupola of the dome, taken at Messrs. Dorman & Long's works before being fixed on the building.

A view of the stonemasons' yard at the side of the building, showing 300 masons at work, was published on p. 25 of the supplement to our issue of December 28th last. This is one of the most modern equipped masons' yards in the country, every mechanical appliance

FIG. 1.—THE ERECTION OF THE MERSEY DOCKS AND HARBOUR BOARD OFFICES, LIVERPOOL: VIEW LOOKING EAST, ACROSS THE CENTRE OF THE DOCK, TAKEN ON DECEMBER 23RD, 1903, SHOWING CONCRETE PIERS AT SPRINGING LEVEL.

possible being utilized in the working of the stone with a view to economy and speed. On the right hand are seen the banker-hands and on the left the shedding covering the planing and moulding machines, lathes, circular saw, with the swing saws at the far end, all worked by electricity.

Fig. 9 shows the south-east corner, taken on September 27th, 1904. Another view showing the general condition of the building on October 27th, 1904, was also published in our issue for December 28th last. Fig. 10 is a view of the frontage to the river and Fig. 11 shows the aspect to the south-east; Fig. 12 is a view taken on April 28th, 1905, showing the roof spans along the east side of the building, looking south.

We propose publishing further photographs at a later date.

The excavations for the concrete foundations were not commenced until September, 1903; the average depths are 50ft. below street-level. At the present moment the roof is being fixed to the four sides of the building and a portion slated. This is remarkable progress for a classical building of this kind, considering the difficulty experienced to get from the quarries at Portland the very large sized blocks of stone required, the weight of some of these, when worked, being more than 5 tons.

A striking feature in the erection of this building is the excellence with which it is served by cranes, these having steel jibs of 80ft. commanding the whole area, and being of the most modern type, operated by electric power. The architects of the building (a perspective drawing of which will be found on p. 9 of the supplement to our issue

FIG. 4.—THE CONDITION OF THE SOUTH FRONT ON APRIL 22ND, 1904.

for December 28th last) are Messrs. Briggs & Wolstenholme, F. B. Hobbs and Arnold Thornely, of 51, North John Street, Liverpool,

and the builders are Messrs. William Brown & Sons, of Trafford Road, Salford, Manchester.

Views and Reviews.

Elementary Building Construction.

This is an addition to the list of books on building construction intended, primarily for elementary students in technical institutes; and while it is on the whole of equal merit to its fellows, and in some few respects superior, it suffers from the same defect of treating the subject from a school teacher's impracticable point of view. The subject is dealt with more as a hobby or an exercise, and the vital relation of the subject to practical conditions is often lost sight of. We are still waiting for the book which shall treat the subject in a scientific and practical manner—that is, a book which, while being technical, will at the same time be perfectly clear to the young student. Mr. Booker has certainly done well in this work to treat materials more fully, and the illustrations are very clear and numerous, but it is not written in such a happy style as we could wish. The sentences are often involved, and several grammatical errors are noticeable. There is no reason why the matter should not be treated brightly and interestingly. Mr. Booker divides the book into the usual sections, such as brickwork, carpentry, joinery, slating, tiling, plumbing, &c.; chapters being devoted to such details as roofs, partitions, beams and cantilevers, and damp-prevention. This method is decidedly objectionable, because the student is immediately plunged into the details of the subject before he has grasped the principles. Any book which claims to be a proper educative medium must develop the subject gradually from the sciences of mechanics and chemistry. As to the latter all the authors of works on building construction up to the present have been strangely neglectful, with the result that their explanations of materials and the effect of conditions upon them are often absurd

FIG. 8.—STEELWORK OF CUPOLA OF DOME.

FIG. 6.—THE DOME FROM ABOVE ON FEBRUARY 27TH, 1905, SHOWING CONCRETE ARCHING TO CARRY MASONRY.

and lead to rule-of-thumb methods which are the great bugbear of the building trade. The old traditional system of instruction under apprenticeships have now gone by the board and the polytechnics have taken their place. While technical schools are an improvement in many ways upon the apprenticeship system, yet they are not so efficient in others. Architects and craftsmen in the old days were led to understand practical conditions in actual work, and if not taught scientifically, gained sufficient knowledge in the school of experience of the reasons for the various forms of construction which enabled them to use these intelligently without producing such illogical results as appear to be the general characteristic of much of the present-day constructive work. It was true they were not very inventive and did not quickly respond to altered modern conditions, preferring to adhere to the methods with which they were well acquainted; but if the technical institutes are to adequately supplant the apprenticeship system they must be more thorough. We are reluctantly compelled to conclude that this book is not one that will help forward this object.

"Elementary Practical Building Construction," by F. W. Booker, F.S.I., London: Longmans, Green & Co., price 2s. 6d.

IN PARLIAMENT.

(By Our Press Gallery Representative.)

MR. BRYCE asked Lord Balcarres whether the attention of His Majesty's Government had been called to the intention announced by the town council of Berwick-on-Tweed to sell for building purposes a piece of land on which there stood parts of the ancient walls of that town, dating from the time of King Edward the First; and whether, having regard to the great interest of these walls as being one of the best examples of mediæval fortifications still left in this country, His Majesty's Government would take such steps as were within their power to prevent the destruction of this important monument of antiquity.

Lord Balcarres said the answer to the first paragraph of the question was in the affirmative. His Majesty's Government had entered into an agreement with the town council by which they had succeeded in preserving the most interesting portions of the remains of the fortifications, including the Bell Tower, and it did not appear to be possible to do anything more at present.

Mr. Trevelyan wished to know on what

spot in the Horse Guards Parade it was intended to erect the statue of the Duke of Cambridge.

Lord Balcarres replied that there was a proposal to erect a statue in memory of the late Duke of Cambridge in the neighbourhood of the Horse Guards, but as yet no site had been selected, and it had not been suggested that it should be erected upon the Horse Guards Parade.

Mr. Herbert Samuel enquired of Lord Balcarres when the repairs to the fountains

in Kensington Gardens which were now being again undertaken were first begun; in what those repairs consisted; when they were likely to be completed; whether they had been carried out by a contractor or by the Office of Works; what was the cost originally estimated, and what was likely to be the actual cost.

Lord Balcarres stated that the honourable member was under some misapprehension as to the repairs to the fountains in Kensington Gardens "now being again undertaken." All works were completed some three months back. The fountains were started in April of this year and had continued playing since. The renewal of the deep-well pumps, the removal of old boilers and the supply of new, and the rebuilding of the engines commenced in 1903. It had been necessary to deal with the service in sections. The works had been carried out by contractors, the original cost being estimated at £2,448 and the actual cost being £2,583.

Mr. Field asked the Chief Secretary for Ireland whether he would arrange that the materials to be used in the erection of the College of Science in Dublin should be Irish, whether he was aware that a greater portion of the material used in the Albert Agricultural College was imported, and whether he would see that Irish materials should be used and Irish workmen and Irish architects employed on public works in Ireland.

Mr. Victor Cavendish replied: "As I have stated on several previous occasions, I do not consider it feasible to restrict contractors in the choice of their workmen or materials, but I have no doubt that where practicable preference will be given to Ireland. As regards the Albert Agricultural College, I am informed that it would be incorrect to say that the greater portion of the building materials used were imported."

FIG. 9.—FRAMEWORK OF DOME FROM ABOVE (TAKEN ON MARCH 27TH 1905).

FIG. 10.—VIEW OF WEST FRONT OF THE MERSEY DOCKS AND HARBOUR BOARD OFFICES, LIVERPOOL, TAKEN ON APRIL 28TH, 1905.

THE FIRST WALLPAPERS.

THOUGH wall-hangings made of paper had been in use among the Chinese from very early times, they do not appear to have been adopted by the West until the middle of the sixteenth century, when they began to be imported by Spanish and Dutch merchants; but it was not before the end of the following century that this less costly substitute for the tapestries, silk and satin damasks, figured velvet, stamped leather painted and gilded, which formerly adorned the wall of the fortunate, found its way into our islands; it was a hundred years again, owing to the excessive tax which hampered the industry, before it became possible for their manufacture to be carried on at home on any considerable scale.

The early experiments, says Mr. A. G. B. Russell in the "Burlington Magazine," which preceded their introduction from the East were, as is naturally to be expected, of a purely imitative character, consisting of an endeavour to supply colourable reproductions of the fashionable hanging in a cheaper material. As is also to be expected, the result was possessed of little or no artistic merit. But there was one exception. About the time of the accession of William and Mary, a few years after the Chinese craze had invaded England, wallpapers designed and painted in China began to reach our shores. The *rapprochement* with Holland (whose Oriental trade had long ago provided this luxury for herself), consequent upon the arrival of the Dutch prince, was to some extent responsible for this; but our own East Indian Company, which had first

touched China in 1637, had at this time a rapidly increasing traffic with the Far East. The coming of wallpapers to match the prevailing taste was joyfully welcomed in polite households, and though they were far from being cheap, they were widely employed both in England and France, and remained in fashion for at least a century and a half.

A delightful wallpaper of Chinese origin has been hanging since the close of the seventeenth century on the parlour walls of a house, formerly in the possession of the Berkeley family, at Wotton-under-Edge, in Gloucestershire. It is thus one of the very first of the Chinese papers to have been put up in an English house.

FERRO-CONCRETE.

SOME OF ITS MOST CHARACTERISTIC APPLICATIONS IN BELGIUM.*

By M. ED. NOAILLON, of Chenee, near
Liege.

FERRO-CONCRETE is a material which was unknown to the general public a few years ago, but has now entered with phenomenal rapidity into all branches of constructional work. This result is due to its remarkable properties, which may be stated as follows:—

(1) The economy rendered possible by its use as compared with other systems.

(2) Its resistance to fire, which is now put beyond doubt by numerous tests, some made for the purpose and others the result of accident. It is moreover the only flexible material which possesses this quality of fire resistance; and after the results of the disastrous fire at Baltimore it is clear that very little confidence can be felt in the use of metallic frameworks covered with thin coatings of refractory materials.

(3) It is unaffected by atmospheric action. Concrete is from this point of view comparable with stone of the best quality, and it improves with age. As to the metal built into the concrete, it has been proved that it is perfectly preserved without loss of weight, and that even if used in a rusty state it will recover after some time the bluish tint which it possessed when leaving the rolling mill. This almost incredible result is due to a chemical action of the cement and probably to the formation of a protective coating of silicate of iron. Concrete also resists equally well the effects of corrosive fumes and liquids which are feebly acid. It may be used for marine works if the proportion of cement employed be high.

(4) The ease with which the material may be made to take any desired form. While preserving the architectural appearance of stone a boldness in construction may be attained which is impossible with the latter material. It is merely necessary to measure the materials precisely; an error can be corrected during construction and unforeseen details can be improvised. This adaptability is specially valuable in dealing with existing structures.

(5) Its homogeneity, and the mutual support which neighbouring parts give in resisting concentrated loads. Joints are no longer weak places. Girders which cross pass through each other without a break. Monolithic constructions are rendered possible which are far more resisting than others to secondary stresses.

(6) Its rapidity of execution. The constituent parts are merely raw materials requiring no previous preparation, and therefore procurable without delay. The individual importance of the single parts is negligible, thus rendering them easy to obtain, transport and erect. Night-work also does not occasion the noise caused by riveting.

(7) Its impermeability, if it has been "floated" immediately after construction in a careful manner. Under such conditions it may be used in the construction of flat roofs, reservoirs, sewers, &c. The monolithic structure which is also watertight may be produced without crack or re-entering angle, so that it can be freely washed down with the hose. Such a structure is essentially hygienic.

(8) Its great rigidity and the localization of the effects of shocks.

Concrete.

The material is an agglomerate of hard stones bound together with cement. As cement is expensive and contracts considerably, it is of advantage to use the least possible quantity by reducing the volume of the voids between the pieces of stone. This result is obtained by using a mixture of materials of different sizes, such as gravel and sand. Moreover, in order to disperse the cement with great certainty equally through the mass it should be mixed with sand only. Instead of gravel, granite chips, the refuse of the quarries, may be used with advantage. Although these chips cause more voids they nevertheless give a tougher product owing to their angular form, which increases the adherence. Granite dust may also be used instead of sand. The choice of cement is of the utmost importance, and in order to be quite certain it is desirable to use only Portland cement of a well-known brand; according to the nature of the work the concrete contains from 350 lbs. to 700 lbs. per cub. yd.

In systems of construction where the metal framework can carry by itself the whole load, and where the concrete is merely intended to protect the metal, to fix it, and to hold its different parts together, then, the quantity of cement may be reduced to the minimum and the gravel may be replaced by slag or by coke-breeze. The concrete is far weaker than the other, but it is less expensive, lighter, more refractory and more sound-proof, and nails can be driven into it.

Metal.

At the present time the metal almost exclusively employed is mild steel with an ultimate tensile strength of 27 tons per sq. inch. This costs no more than iron, and has the advantage of possessing a greater tensile strength and a higher coefficient of elasticity than the latter metal.

Round bars are generally used, as they facilitate the escape of air and the proper ramming of the concrete; they also possess no sharp angles which would cut the concrete, but, on the other hand, the round section gives the lowest coefficient of adhesion for a given cross-section of metal.

Centering.

The construction of the centering is the most important part in the erection of structures in ferro-concrete. It takes up the most time and seriously enhances the cost of

FIG. 11.—VIEW FROM THE SOUTH-EAST, TAKEN ON APRIL 28TH, 1905.

* A paper read before the Liège meeting of the Institution of Mechanical Engineers.

the work. In the design of the centering the contractor has an opportunity to exercise all his ingenuity; to use wood which can be again employed, and to avoid cutting the wood into short lengths and so causing waste of material. If vaulted forms have to be constructed the cost of the centering may be greater than that of the ferro-concrete itself.

Certain systems reduce or even obviate altogether the use of centering by the employment of metalwork of sufficient strength or pieces of concrete specially made for the purpose. Mouldings as a rule are roughly formed in the concrete by centering, and then finished in gauged work; but the latter is a difficult process, for the neat cement takes some time to set and is not sufficiently plastic.

Deflection.

It is not possible by a simple examination to ascertain the strength of a finished structure in ferro-concrete, for the metallic members are no longer visible and their precise size and position cannot be gauged. The only method is to measure the deflection of the structure under given loads. The results obtained are, however, not precise, and useful information can only be gained by comparing similar structures. The deflections of structures in ferro-concrete are much less than those which would be given by a structure of equal strength built of wrought-iron; for when concrete is stressed up to its elastic limit its deflection is less than that of iron under similar conditions.

Principles of Construction.

Professor Rabut has summed up in the following six rules the principles which experience and theory recommend should be followed in the construction of ferro-concrete buildings:—

- (1) No connections should be made of iron to iron, as the concrete itself holds the parts together in the most economical manner.
- (2) At least two distinct systems of reinforcement should be used—the one system to take up the tensile stress and the other to take up the shearing stresses in the concrete; when it is necessary a third system should be used to take up the compressive stresses.
- (3) To so arrange the reinforcement that the separate members may be stressed in the direction of the length, so that the stresses produced between the iron and the concrete shall be tangential and not normal to the axis of the members of the reinforcement.
- (4) To profit by all means of increasing the homogeneity of the various parts of the structure. This may be done by prolonging the iron parts of one portion of the structure into the thickness of the concrete of the adjoining portions, at a negligible cost; while the construction of rigid joints in a metallic structure is very expensive.
- (5) On the other hand, advantage should be taken to the utmost extent of the homogeneity thus obtained to economize materials.
- (6) In view of this homogeneity sudden alterations in the cross-section of the parts should be avoided, as the parts tend to assist one another and to distribute the stresses, the constitution of ferro-concrete being, so to speak, democratic.

The component parts of a ferro-concrete structure may be classed under three headings, which the author will examine in turn. They are (1) the parts which resist tensile stresses, (2) those which resist compressive stresses, and (3) those which resist more complex stresses.

Parts resisting Bending Stresses.

These comprise chiefly the beams and the platform beams. In the majority of cases the beam supports a platform which is solid with it, and can therefore be used as a framework in compression; and this is one of the most characteristic properties of ferro-concrete. The beam is therefore really composed of the rib and the part of the platform on each side, and this has a cross-section in

the form of a **T**. The tension member consists of one or of several metal bars embedded in the lower part of the rib.

The materials are therefore used in the most rational manner, the concrete of the platform is subject to compression and the metal resists tension; but this specialization of work is only possible owing to the adhesion of the concrete to the metal. In reality there are forces tending to produce sliding, and these are proportional to the shearing forces, and therefore attain their maximum value near the supports. These forces tend to shear the concrete of the rib and are concentrated at the contact surface of the concrete and metal. The mutual adhesion of these two materials has a very great importance, and it is well to bear this in mind.

Numerous tests have shown that in a carefully-built structure this adhesion is not of lower value than the shearing coefficient of the concrete itself. If, however, the concrete be very poor in cement, or if it has been gauged too dry and insufficiently rammed, then the adhesion may be low and the use of bars of special section has advantages, these bars having projections which prevent all slipping of the metal in its concrete sheath. Such bars are very commonly used in American practice.

It has been stated that the adhesion was illusory, and that in reality the effect was merely due to a high coefficient of friction between the iron and the concrete which compressed it in shrinking. But the fact that beams subject for lengthened periods to incessant vibration, such as those in the floors of flour mills, have remained sound tends to prove that the adhesion is real and lasting. Special tests have always given reassuring results, except when they have been made upon flat contact surfaces; but this is a condition which does not occur in practice, and it is probable that during setting the contraction of the cement produces tangential stresses which destroy adhesion as it is produced. In the case of cylindrical surfaces, on the contrary, this contraction produces compression normal to the axis of the cylinder and therefore favourable.

Adhesion does not only assist in resistance to shearing stresses, but the variations in relative volumes of the two materials in contact must be considered; these variations being caused by change of temperature or by shrinkage of the concrete.

Temperature has no influence, for the coefficients of expansion of iron and concrete are practically the same. When concrete sets in air it contracts, and therefore may produce considerable initial compression upon the embedded metal whilst being itself subject to an equivalent tensile stress. When the concrete sets under water the opposite effect is produced: the concrete expands and puts the metal in tension.

Resistance of the Shearing Stress.

It is important that the shearing stress should neither overcome the adhesion of the metal to the concrete nor shear the rib of the beam. To fulfil the first condition it is necessary to form the metal framework of such a number of bars that their surfaces in contact with the concrete shall be large enough, and

in consequence the chance of surface slips shall be reduced. To avoid shearing of the rib special stirrup-shaped bars are used which join together the two members. It is not correct to state that these stirrups directly resist the shearing stress. In reality, a piece which is under shearing stress throughout its entire length is by that stress subject to bending, but the stirrups have no rigidity and are incapable of resisting any appreciable bending moment; as a matter of fact they fulfil the same purpose as the tension bars in the web of a lattice-girder; the duty of the compression bars is fulfilled by the concrete of the rib. It is therefore obvious that it is essential for the stirrups to be hooked at one end to the tension bar, and that at the other end they should be solidly embedded in the concrete platform. Fig. 1 shows the transverse section of a beam built on the Hennebique system and beside it the drawing of a single stirrup. This stirrup consists of a flat bent bar with the two ends bent in the form of claws, allowing it to hook itself solidly into the floor structure. The use of the flat bar in preference to the round bar facilitates the construction. Fig. 2 represents a cross-section of a beam on the Coignet system. Here there is an upper iron framework. Owing to this it is possible to put the framework of a beam together in advance, and to place it in position entire while holding it by the upper bar. The attachments are made of bars of round iron bent to **U**-section, and the ends are twisted together so as to form an elongated ring. Owing to the presence of the two frameworks the attachment binds the two members together very effectively. The round section is better suited to the concrete than the rectangular form.

Another means of resisting sliding consists in omitting horizontal bars in tension and substituting bars fixed obliquely in the webs and rising to the floor structure at the ends of the beam. In this manner a beam of variable height is obtained approaching more or less closely to the parabolic form, that is to say, the ironwork will be subject to a constant tension upon its entire length, and the shearing stress will be zero, as it is neutralized by the vertical component of the oblique tension in the bar. In this manner, however, the difficulty is only set back a step, for the bar being in tension right up to the ends, must lose it rapidly in a very limited space, whence arises a considerable tendency to slipping, which is met either by opening out the end into a swallow-tail, or, if this is insufficient, by bending the bar upon itself and placing a cross pin in the bend. The simple oblique bar is not used for a beam with free supports.

Stresses near the Supports.

The author has pointed out that one of the characteristics of concrete is to lend itself easily to continuity of structure; but it is clear that this may have the effect of displacing towards the bottom the diagram of the bending moments in such a way that near the supports certain reversed moments may be of higher value than the moment at the centre of the span. From this cause tensile stresses are produced in the top member and compression stresses in the bottom member.

In order to overcome the first set it is necessary to provide new reinforcement if it does not exist in the upper member, or to raise the lower reinforcement towards the top of the beam, which has also the advantage of neutralizing the tendency to sliding, as has already been pointed out. To overcome the second series the concrete of the lower part of the web is often insufficient, and then the lower reinforcement is used at this point in compression. Another method which is coming into use consists of banding the concrete of the web, which, as will be pointed out hereafter, considerably increases the resistance to crushing.

When the reversal of the moments is due to the continuity of the beam and the floor platform the use of reinforcement in the upper part is not always necessary; in fact, the platform may then play the part of the member in tension, owing to the "distributing" bars which it contains and to the resistance to tractive efforts of the ferro-concrete itself, which will be discussed later.

When the beams have no continuous platform at their upper part they ought to be provided with comprehensive reinforcement or be banded.

Fig. 3 is a longitudinal section of a portion of a beam on the Hennebique system. It will be observed that half the bars composing the lower reinforcement rise to the top at the supports, resisting at the same time the tendency to slide and also the moment of shearing at the junction. The other half keep their position right to the end, where they serve to resist the compression and to support the stirrups.

Fig. 4 represents a portion of a beam built upon the system of Perraud and Dumas. The attachments are formed of a trellis of flat strips bent obliquely between the lower reinforcement and a bar at the top, so that the body of the beam forms one mass of great rigidity which is of value in the erection. The lower ironwork is reinforced in its central part by a bar in order to obtain as nearly as possible a section of canal resistance. This method has, however, the disadvantage of giving a minimum perimeter to the section of the ironwork at the supports, which are precisely the points where it should have its greatest value. At the level of the platform there are bars to resist shearing at the supports and compression bars in the centre.

The author of this paper desires to advocate a simple system which affords a reinforcement of canal resistance and offers every security for resistance to sliding. Fig. 5 shows its application to a beam without fixed ends. For a span of moderate amount the reinforcement consists of bars of three different lengths.

It will be seen that they leave the lower part of the web at determined distances and rise towards the floor structure, where they end in a hook. In these hooks, as well as in the angles formed by bending, there are placed transversely pins *a* and *b*. These pins are of great importance, for they represent the placing, between the oblique parts, of bars which may be considered as the diagonals of the web of a lattice-girder, and the concrete lying between *a* and *b* which is analogous to the compression bars.

The reinforcement of a beam with platform is calculated according to the nature of its central transverse section where the maximum bending moment occurs. As the sliding efforts there are zero, the normal sections remain flat after deformation and merely swing upon the neutral axis. This condition of conservation of the plane sections, combined with the equations of equilibrium of movement and of moments, suffices to determine the forces acting upon the reinforcement. But for this it is necessary to know the law which connects the compression of the concrete to its decrease in length. This law,

FIG. 3.—BEAM ON HENNEBIQUE SYSTEM.

FIG. 4.—BEAM ON PERRAUD AND DUMAS SYSTEM.

FIG. 5.—BEAM ADVOCATED BY THE AUTHOR.

however, varies within wide limits according to the composition of the concrete, and especially with the manner in which it is used in the work, the degree of fluidity and the ramming. Moreover, the law is not linear and is greatly affected by hysteresis, so that the deformation is a function of the duration of the compression and of the former life history of the concrete so far as stresses are concerned. Yet when the height of the beam is great relatively to that of the floor platform the variation of the law of deformation of the concrete does not sensibly affect the forces acting upon the reinforcement, and the section of the latter may be calculated with sufficient accuracy.

It should be noted that the elements of the floor platform which constitute the reinforcement in compression have an efficiency which diminishes as their distance from the web increases and as the length of the beam decreases.

The Floor Platform.

When in a beam of T-section the part of the concrete in tension in the web has merely an insignificant influence and may be neglected, it is desirable to enquire if it is not the same with the concrete in tension in a floor platform which has a section larger than that of the concrete under compression. M. Considère has shown that ferro-concrete can extend without cracking until the reinforcement reaches its limit of elasticity, and that the part of the resistance due to the concrete attains after the first extensions a value which remains constant until rupture occurs. It is evident that if this result is to occur the piece must be free from all cracks before the test, and to obtain this condition special precautions must be taken in its manufacture and setting. Excess of water must be avoided in gauging, ramming must be carefully done, and the piece must be kept moist during the first days of setting.

In practice these conditions are never fully realized, and therefore the rapid shrinkage of the cement produces premature tensile stresses which cause hair cracks. But these cracks never affect any great depth of the floor structure, and many contractors think that one may therefore count upon almost the whole of the concrete in tension to relieve the reinforcement; others, on the contrary, believe that it is always dangerous to count upon this aid.

The tension of the reinforcement of a platform will also vary with the law of deformation which it may be thought desirable to apply to compressed concrete, a law which is all the more uncertain as concrete is not homogeneous; in fact, the last layer of concrete is not generally rammed so as to facilitate levelling. It is therefore obvious that the theoretical calculation of floor structures can only have a relative value, and

that the coefficients which are used in these formulæ ought to be obtained from practice. This uncertainty in calculation is, besides, often hidden by the want of precision with which the reinforcement can be fixed in the thickness of the platform.

Like the beams, the platforms are very often fixed or continuous, and this condition requires reinforcement in the upper layer, or in a simpler manner by the raising of the lower reinforcement near the supports (Fig. 2).

With respect to resistance to sliding, as the perimeter of the section of the reinforcement is almost always less than the width of the platform it is useless to provide stirrups. Besides the principal reinforcement, there are placed immediately above it, and in a perpendicular direction, some "distributing" bars which are intended to interlace with several of the principal bars and offer a better resistance to a concentrated load. In order to ensure regularity of erection the two systems of bars are sometimes bound together at some of the crossing points by means of iron wire.

When it is a question of covering a surface approximately square—a case which occurs frequently in houses—there is a great advantage in making the two systems of bars of equal strength so as to make use of all four sides of the space as supports.

The uncertainty of the conditions of stress upon the reinforcement which is so great for the ordinary floor platforms is still more so for the square surfaces referred to above. The reinforcement may be fixed in lines parallel to the sides or parallel to the diagonals: the use of the latter system, which necessitates a large number of different lengths of bars, cannot be justified by any theoretical consideration; a satisfactory system consists in placing the reinforcement parallel to the sides and grouping the bars closer together along the middle of the sides.

A simple and elegant arrangement for surfaces of small dimensions consists in the use of expanded metal as the reinforcement; perfect security is then obtained for the necessary adhesion, and a poor concrete may be employed. This method of construction can be recommended for foundation blocks.

Pieces for resisting Compression Stresses.

Columns are usually made of square section to facilitate centering; as a rule the reinforcement consists of four longitudinal bars placed near the four angles and joined at intervals by cross-ties. The ties are intended to prevent the buckling of the individual bars, and also serve to retain them in position during the filling of the concrete. The cross ties consist of plates or round bars which surround the longitudinal bars. Sometimes they are twisted round each bar, or plates with holes may be threaded upon the bars.

The calculation of the reinforcement is

empirical, for the determination of the strain is first of all affected by the uncertainty regarding the law of deformation of the concrete, since it is directly proportional to the latter. Besides this the shrinkage of the cement communicates to the metal an initial compression which is often very considerable but impossible to value beforehand. Moreover the bars also assist in resisting the tendency to buckling of the entire column, but the buckling is proportional to the coefficient of elasticity of the column, and this value varies with the load and is very different for the same load according as the preceding load has been greater or less than the load under consideration.

The resistance to buckling and to crushing is much increased by the use of a concrete very rich in cement, gauged with only a small quantity of water and well rammed.

The methods of reinforcing concrete against compression have been revolutionized by the introduction of the banded concrete invented by M. Considère.

The very remarkable work of M. Considère has shown that metal employed under the form of bands has, from the point of view of resistance to compression, an efficiency 2.4 times greater than that used in the form of longitudinal reinforcement. To be effective these bands ought to be circular and should not be placed further apart than one-seventh of the diameter of the banded concrete. By submitting the banded pieces to an initial compression or letting them harden under water the bands become also much more efficient than longitudinal bars in resisting buckling. They have also the considerable advantage of being endowed with an absolutely surprising plasticity, which makes a thoroughly sound structure. Warning is also given of excessive compression by the shelling off of the concrete covering the bands long before the structure has reached its safe limit of compression.

The simplest and most economical form of the bands is the spiral. By putting the turns of the spiral closer together it is possible to strengthen certain parts which are under the greatest stress and give a known increase to the strength. It is also possible to reinforce a structure already completed by winding round it an iron wire which is afterwards covered with a layer of plaster. Banded pieces prepared in the workshop with all possible care, and made with a very rich concrete and subjected to initial compression, offer a resistance to compression comparable with that of a structure of riveted steel of the same weight, and are less expensive.

It is safe, therefore, to prophesy that banded concrete will be able in a large number of cases to replace with advantage the compression members made of rolled steel sections in a large metallic structure. The tension members would consist of bundles of round bars lightly banded and dipped in concrete. The connections would be more easily made than those of other frameworks, and could be reinforced by a supplementary banding. Such structures would have an unlimited life with practically no expense for maintenance. In this connection M. Considère has constructed and tested with complete success a bridge of 65.6 feet span entirely built of banded concrete.

An important application of banded concrete has come into ordinary use for piles. Such piles are stronger than those of wood, and have the enormous advantage that they do not rot.

Parts submitted to Complex Stresses.

The most important type of these pieces is the vault, in which the reinforcement is specially designed to resist bending stresses caused by non-symmetrical or concentrated loads, whilst the concrete supports in compression those that are fixed and distributed. The greatest uncertainty exists as to the most rational method of reinforcing a con-

crete vault; the calculation of the reinforcement is only rendered possible by the use of empirical coefficients. For vaults of wide span one observes that different builders follow opposite methods; some, like Hennebique, thinking that the essential character of ferro-concrete is the opportunity which it gives for producing monoliths and of profiting in all cases of possible bonding, form their vaults of a series of ribs in arcs connected at their upper parts by a horizontal platform; the arc has then near the supports its maximum of height and this permits a good bonding with the abutments. Other builders seem to be haunted with the fear of the effect of expansion and of shrinkage, and give to their vaults as much flexibility as possible by making them with a cylindrical lattice-work. In recent years some have gone further in this direction and formed arches with three joints.

As has been seen from the preceding remarks, it is most frequently impossible to determine accurately by means of theoretical formulæ the actual cross-sections of the reinforcement. The best guide is experience translated as well as possible into empirical rules. These rules will be all the more reliable according as they are based upon a larger number of structures, and from this point of view it is best to prefer the systems which have been the most employed in practice.

On the subject of principles of calculation for structures in ferro-concrete it is interesting to cite the opinion of Professor Rabut:—"I often hear it said that structures in ferro-concrete cannot be so accurately calculated as metallic structures; in my opinion the contrary is true; the formulas for metallic bridges are in their principles just as arbitrary and just as far from the expression of the real strains as those of ferro-concrete; but the latter have the advantage of containing twice as many constants, those of iron and those of concrete, which, if these constants are conveniently chosen, will allow of approaching the truth much more nearly.

The author will now briefly describe some types of constructions in ferro-concrete which present interesting features, and will restrict his choice to recent works and those to be found by preference in the neighbourhood of Liège.

Dome of the Central Railway Station at Antwerp.

This dome springs from the level of the roofs of mass of buildings of the station at a height of 130ft. above ground level and rises another 130ft. to the spire. It is entirely constructed of ferro-concrete by the firm of Vasanne of Brussels. The work was originally intended to be built in stone, but it was discovered that the foundations would not carry such a weight, and therefore ferro-concrete was preferred, as it could be built hollow. However, it was necessary to follow minutely the form of the original design, which, rationally conceived for a massive material like stone, often presented serious difficulties of execution in ferro-concrete.

The dome comprises four large glass lights placed upon the sides of a square, and upon these rests the actual dome which in its turn supports a lantern. Each glass light is in the form of a gallery with seven arcades surrounded by an arch of 32.8ft. radius. The arches are framed by an archivolt of 11.5ft. height, which receives at its periphery the haunches of the dome.

The entire structure, which is 1,800 tons in weight, rests entirely upon the columns at the angles of the glass lights, for it was only at these points that a solid support could be obtained. These columns are Y-shaped in the cross-section, which has an area of 10.7 sq. ft., and they are subdivided at the height of the centres of the arches into three beams.

The tail of the Y is extended in the diagonal plane in the form of a thrust block

rising obliquely between the two shells of the dome. Each of the limbs of the Y forms the abutment of the beams in the arch, 8.2ft. high, situated in the archivolt. In the horizontal plane passing through the tops of the archivolts is placed a beam in the form of a flat ring 4.92ft. wide, which is supported at eight equidistant points, which are the four tops of the archivolts and the four ends of the thrust blocks.

This beam serves two purposes—it balances the horizontal reactions due to the obliquity of the thrust blocks, and resists the tensile stress created by the joists of the dome. At the top of each beam of the archivolt are hooked two tie-rods which go down in the two midribs of the arches and extend into the two central columns of the gallery of arcades, and support in its place a horizontal beam hidden in the entablature of the gallery and supporting all the lights; it is obvious, therefore, that all the weight of the latter is supported by the columns.

The dome consists of two superposed shells at a distance apart varying from 3.28ft. to 6.56 feet. The internal shell which forms the ceiling of the entrance hall is completely decorated with sunk-moulded panels; some are round and others square, and they diminish in depth and size progressively from the springing to the summit.

They leave only flat bands on the inside of the shell, and these follow a series of meridians and parallels. A part of these flat bands are formed by a skeleton of joists and trimmers which are supported on the annular beam, and they carry the whole weight of the dome. This skeleton was first erected and served to support the cores which formed the moulds for the panels, and then the latter were filled in with concrete.

The external shell has a uniform thickness of 3.15ins., and it is relieved by six moulded ribs following meridian lines. It is supported upon the internal shell by small distant pieces normal to the two surfaces; this method of support has been chosen to allow as much freedom as possible for the unequal expansion of the shell owing to the rays of the sun striking it obliquely.

The most interesting feature of the construction of the dome of the Antwerp station is that all the mouldings and all the sculptures, which are so numerous and of so many different forms, have been executed by direct moulding, and not, as is usually the case, by rough applications which are trued up afterwards by gauge boards. It would never have been possible to make in wood the numberless moulds which would have been needed for the latter process, particularly as the work had to be done upon surfaces bent often in two directions like the panels of the dome.

M. Vasanne has invented a very ingenious system of moulding. He begins by executing in plaster the model of the sculptures which are to be reproduced in the concrete. He then spreads upon this negative mould a layer of 2ins. to 2ins. thickness of a paste made of sawdust and magnesium oxychloride. This paste hardens rapidly and gives him the desired mould, which is light, strong and can be worked like wood; the same negative mould can be used several times.

Renommée Hall at Liège.

This hall was built entirely of ferro-concrete by the firm of Perraud & Dumas, of Brussels. In opposition to what took place in the design for the dome at Antwerp, the general arrangement, the style and proportions of all the parts of the building were specially thought-out by the architect, M. Jaspar, so as to be the most suitable for construction in ferro-concrete, and in order to use the properties of that material to the best possible advantage. It was desired to oppose the tendency to make concrete merely play the part of a servile imitator of stone by the employment of a

characteristic design which should indicate the nature of the material used.

The principal hall is covered by three cupolas, each 55ft. diameter, placed at a height of about 50ft. above the level of the ground. Each cupola forms part of a sphere which continues in haunches pierced with lights and descending to the corners of the circumscribed square. The intersections of the spheres with the vertical planes passing through the sides of the squares are formed by arched beams which spring from the capitals of short cylindrical columns. The cupolas are 4½ins. thick and are made of concrete composed of cement and clinker finely broken up; they are reinforced by a layer of expanded metal and with a lattice-work of bars. The centering of the first cupola was carried out upon a new design. In order to avoid the great expense entailed by the construction in wood of a spherical centering, a skeleton was built up of iron-work consisting of 16 bars, each 1½ins. diameter, fixed upon the meridian lines like the ribs of an umbrella, and these were interlaced upon parallel horizontal circles by other weaker bars. The whole skeleton was then covered with sheets of expanded metal, which were designed as the first reinforcement, and afterwards the concrete was put on above and below so as to completely surround the expanded metal, which thus acted as its own centering, and it was merely necessary to render the surface up to the required thickness. The bars of the skeleton were then removed and used for the other

ashlar work and to destroy the keystones in the arches, which would have been very unwise. The author of the design, M. Prangey, engineer of roads and bridges, got over the difficulty in a very satisfactory manner by fixing the brackets in pairs opposite one another. The brackets were made independently two months before they were needed; the three round bars, 1½ins. diameter, which formed their reinforcement in tension, were left projecting beyond the concrete about a yard, and the ends were screwed. The brackets were put in position, a pair at a time, by means of two cranes, and as soon as their bases had been entered into the recesses cut in the masonry of the bridge the ends of the three pairs of bars were coupled together by means of three tie-bars which crossed the roadway, and these tie-rods were provided with long sleeves threaded to fit the ends of the screwed bars. In this way each pair of brackets were mutually self-sustaining, and the cranes could leave them fixed. It was merely necessary then to level them up carefully by tightening or slackening the screwed sleeves, and then to pin them permanently in position by running in cement grouting round the ends of the brackets in the masonry. All the tie-bars are embedded in a layer of concrete 6½ins. thick, which extends across the roadway and serves to constitute the gutter to carry off water that percolates.

The platform, which is supported by the brackets, is calculated for a distributed load of 80 lbs. per sq. ft., and was tested up to

arches which form the struts. In the neighbourhood of the keystone, and for about 82ft. in length, the roadway is solid with the vault of the principal span. This vault is 2½ft. thick at the haunches and 1½ft. thick where it dies into the roadway; it diminishes further until at the crown the roadway and arch together are only 1½ft. thick. In the parts adjoining the pier, where the vault is clearly separated from the roadway, the latter is supported by three vertical struts 7½ins. thick; one is the axis of the bridge, and the other two forming solid spandrels. The width of the arch being only 18ft., the sidewalks are carried upon brackets 7½ft. long. The roadway is covered with asphalt, and the sidewalks are paved with artificial stone.

Lead Chambers at the Chemical Works of the Engis Co., Ltd.

This company, under the advice of its managing director, M. L. G. Fromont, who is an engineer, has adopted the system of reinforced concrete for the construction of various foundations and for the construction of tunnels, cellars, platforms, hoppers, silos, frameworks for lead chambers and for various powers, such as are required in the Glover and Gay Lussac processes. Among the interesting applications should be specially mentioned the framework for lead chambers.

It is known that the most modern constructions designed to shelter and support the lead chambers are essentially composite structures, generally made of brick in the lower portion and in iron and wood for the upper portion. The combination and connection of the various heterogeneous parts presents many weak points for attack either by the sulphur gas or by sulphuric acid when an accident has happened. Besides this, the enormous quantity of wood used for this kind of structure makes them highly combustible and exposes the manufacturer to serious risks. These disadvantages alone suffice to justify the use of ferro-concrete, and the structure built at Engis, from designs prepared by M. Faure under the guidance of Prof. Henri Deschamps, constitutes really a monolith from the foundations to the summit without joints or discontinuity.

From the point of view of resistance to gas and acid liquids the composition and treatment of the concrete has been the subject of special study, and the mixtures employed have given perfect satisfaction.

The structure occupies in plan an area 230ft. long by 92ft. wide; it has a total height of 82ft., of which 23ft. is for the lower portion and 59ft. for the upper part. The lower portion is formed of piers placed 16 ft. apart, each consisting of four columns connected at their upper ends by a horizontal girder 92ft. long aided at various points by struts fixed to the base of the columns. The total load carried by the lower structure is about 3,700 tons. At certain points the girders are connected together by joists, and there is a flooring of ferro-concrete which serves as a footway all round.

The superstructure consists of vertical columns 59ft. high, which rise from the ends of each horizontal girder, and besides these there are also columns in the centre of the building. At the upper part all the columns are connected together by horizontal girders with a span of 4½ft., and each of these bears a distributed load of 45 tons. The horizontal connections of these girders form the roof terrace. The columns are solidly connected together by vertical partitions of ferro-concrete, which, in conjunction with various struts, give the desired rigidity to the entire structure. The building was erected in 1900, and since that date has been in constant use and has given no trouble whatever. Owing to the careful distribution of the materials it has not been more expensive to construct than the old unsatisfactory composite buildings.

FIG. 6.—WIDENING OF LA BOVERIE BRIDGE, LIEGE: SECTION THROUGH THE CENTRE OF A BRACKET.

cupolas, and they were finally intended for reinforcing the beams. Unfortunately this system of centering was found to be wanting in rigidity, and it was necessary to use the wood centering after all.

The roof of the galleries and the spherical triangles between the cupolas form a terrace of 957 sq. yds. area, which serves as a promenade. The concrete of the cupolas and the terraces is not rendered in cement; it is made watertight by a layer of Ruberoid. The principal hall is lighted upon its two long sides by six semicircular glass lights, each 52½ft. diameter, framed by arched beams. The spandrels are formed by panels of ferro-concrete showing on the inside ornament in relief; the moulding was done in the workshop, and then each panel was cut into portions that were erected in position. In spite of the complete absence of mouldings, which were left out to facilitate the centering, the hall is of most elegant appearance.

Widening of the La Boverie Bridge at Liege.

This bridge is 147 yds. long. The width has been increased from 32½ft. to 46½ft. by means of two platforms corbelled out at each side of the bridge. At each end these platforms are extended so as to meet the quays by wide quadrants.

The corbelling, Fig. 6, is carried out by a platform 5½ins. thick, supported at intervals of 6½ft. by brackets 11½ins. thick, by 10½ins. in height at the back. The method of fixing these brackets is interesting. Cutting and pinning brackets into the old structure presented serious difficulties, as it would have been necessary to cut deeply into the

160 lbs. per sq. ft. without suffering any appreciable deflection.

The Bridge at La Boverie Island upon the Branch at Liege.

This bridge was built upon the Hennebique system by the Dulac Company, under the direction of the engineer, M. Prax. The chief details of the work are: length between abutments 260ft. comprising a central span of 180ft. and two side spans each 32½ft. wide. The total width of the roadway is 32½ft. The span of 180ft. is the full width of the river-bed; the soffit of the arch is an arc of a circle with a rise at the crown of about 12ft., or a proportion of rise to span of about 1 in 85.

One of the special features of the bridge is that it is built upon foundations constructed by a comparatively new process—the method of mechanical compression of the soil. The piers and abutments rest upon a group of concrete piles driven deeply into the bed of gravel, which is strongly compressed by the methods adopted. The piles are reinforced by vertical bars of steel which are continued into the piers and abutments, so that the whole is solidly bound together. The advantage of this method is to solidly root the bridge into the earth, so that it has a resistance amply sufficient in case of a floating accumulation of ice occurring which temporarily transforms it into a dam.

From the point of view of its construction the bridge is considered as a cantilever with unequal arms, the shorter arm balancing the longer by the weight of the abutment. The roadway is a platform of 7½ins. thick and forms a tension member by means of its reinforcement, and it is supported by the

Law Cases.

A Contractor Claims Damages for Delay.

—An important Reference was decided in Edinburgh involving enquiry into work valued at nearly £70,000 in connection with the building of the Colinton Mains Hospital. Mr. James Lownie, builder, sued for £11,140 for extra work, and the Corporation counter-claimed for £3,255, damages for delay. Mr. James Walker, surveyor, was sole arbiter, and there was only one skilled man on each side. The Reference lasted a fortnight. Mr. Lownie was awarded £6,987 8s. 10d., with interest at 5 per cent. from the date of citation. The arbiter's fee is six hundred guineas, his clerk's account £126 1s. 8d., and Mr. Lownie's expenses £578.

Architects' Charges.—At the City of London Court recently Messrs. W. F. Meakin & Son, architects, 6, Martin's Lane, E.C., claimed 25 guineas for services rendered to Mr. F. Binning, 130, Theobald's Road, W.C. The defendant was the leaseholder of certain premises in Rosebery Avenue, and the adjoining owners gave notice to him that certain structural alterations were contemplated under the London Building Act. The plaintiffs were employed to look after his interests, and now they claimed payment. The defendant had paid 15 guineas into court, and said that the charges were excessive. Judge Rentoul found for the plaintiffs. The defendant was non-suited on a counterclaim.

An Architect's Claim.—The case of *Ford v. Nedas* was heard recently by Judge Edge at the Clerkenwell County Court. Mr. Solomon Ford, A.R.I.B.A., 3, South Square, Gray's Inn, sued Lawrence Nedas, 122, Cannon Street Road, E., for £61 1s. in respect of work done and money expended. Plaintiff prepared plans and rendered professional services as an architect in connection with the structural alterations of defendant's premises at 16, High Street, Gravesend. His charges were 5 per cent. on the amount of the contract, extras and out-of-pocket expenses. The work was done and he gave certificates from time to time, the final one being issued on May 15th, 1905. The amounts paid on the contract were according to these terms, and no exception had been taken to them until after action was brought. Expert evidence for defendant contended that an architect was entitled to 5 per cent. on the cost of the building and not on the cost of the contract, and 2½ per cent. for work provided for in the contract but not executed. After a lengthy hearing the judge said that, according to plaintiff's statement, the claim was based according to the remuneration of the architect's society. If that was so, it was not a question of charging on the contract but on the actual total cost of the works. The rule which said that the remuneration for an architect should be 5 per cent. on the total cost of works executed under his direction meant that whether the contract price was exceeded or reduced he was to have 5 per cent. on that amount. The rules also showed that if the contract price was exceeded he was to have 5 per cent. on any extras. Further, that for work provided for and not done it had been stated that an architect should receive 2½ per cent. That was the basis upon which he (the judge) should hold that the contract rested. His Honour went on to point out that plaintiff prepared plans for covering in a place where a cesspool existed, and such plans the local authority refused to pass. He believed plaintiff must have known of the existence of the cesspool, and so he (the judge) must find that he was not entitled to recover for the plans. He was also of opinion that the charge for colouring the plans was excessive, and, having regard to all the circumstances of the case, he thought the amount paid into Court (£39 15s.)

by defendant was sufficient to meet the whole of plaintiff's claim. Judgement was entered accordingly for the defendant, with costs.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Buildings to Measure at Aberystwyth.

ABERYSTWYTH.—Mr. G. T. BASSETT, A.R.I.B.A., writes: "Referring to the enquiry of 'H. S.' in your issue for June 28th, Llanbadarn Church, one mile from Aberystwyth, mainly Norman but with an Early English porch in a very good state of preservation, would probably afford a suitable subject."

Buildings to Measure on the South-west Coast.

LONDON, W.—J. P. writes: "Will you please name a suitable building such as a small parish church which could be measured within a fortnight for the R.I.B.A. final examination. I should prefer some quiet seaside town on the South-west Coast where one could combine a little pleasure and work during a short holiday."

In Cornwall there is little else but Perpendicular work, and if this country is chosen for your holiday you would do well to make your headquarters at Fowey, which is on the sea and has an excellent church; while it forms a centre for railway excursions to places of architectural interest such as St. Blazey, Bodmin and Padstow, which all contain good examples of ecclesiastical architecture. Falmouth contains a good church and is within easy distance of Penryn and Truro. Good churches are also to be found at Camborne and Redruth, which are quiet towns situated about four miles from the west coast of Cornwall and from one another. St. Briean church would also be suitable for measuring, but it is situated in a very out-of-the-way place near Land's End. Devonshire is richer in Early English work, and one might well combine work with pleasure by visiting Yealmpton or Plymstock both within a few miles of Plymouth and containing examples of Early English churches. St. Mary Ottery, situated about six miles inland from Sydmouth and Exmouth, has a church of the same period. Totnes contains a Perpendicular church, while about three miles from this town stands Darlington Hall, a fine example of fifteenth-century domestic work. Lyme Regis, on the coast of Dorsetshire, offers a good example of Decorated work, and three miles by road from this town is a quiet little place, called Charmouth, which contains a fifteenth-century church. Abbotsbury, near Weymouth, and Warham, near Poole and Swanage, contain Perpendicular churches. A very interesting holiday from the architectural point of view might be made to Somersetshire, making your headquarters at any of the following places:—Axbridge, Cheddar, both containing examples of Perpendicular work, Wales, Glastonbury or Shepton Mallet, which contains an example of Early English architecture. All these towns are inland and are connected directly with one another by rail. Other places in Somerset are Bristol and Brislington, which are about three and a half miles apart and possess Perpendicular churches, and Lympsham is a quiet little town with a Perpendicular church situated near Weston-super-

Mare and a few miles from the coast. Your holiday is short, and it is very easy to underestimate the time required for measuring, so that it would be advisable to get well on with the work before you indulge in pleasure. H. M.

Danger of Settlement due to Drain Trenches.

CANTERBURY.—PRECAUTION writes: "A house is in course of erection (the drains being put in first) where the drain is a distance varying from 2ft. to 7ft. away from main wall and is 3ft. 6ins. below the footings of the basement. The subsoil for a depth of 3ft. is brick-earth and the remainder firm sand, the trenches requiring only ordinary strutting. The height of walls from basement level to roof-plate is 37ft. The basement walls are constructed of cement-concrete 18ins. thick. Is there any danger of settlement if the earth in the drain trenches is thoroughly rammed, or are other precautions necessary?"

It would be advisable to leave struts in at a distance of, say, every 4ft., and in consolidating the soil in the trenches water may be employed.

Removing Paint from Stone Font.

LEICESTER.—BULLDOG writes: "What is the best way to remove paint from an old stone font?"

We suggest the use of "Kompr," a paint remover made by Messrs. H. E. Kershaw, Ltd., of 129-131, Curtain Road, Shoreditch, E.C.

White Matter in Teak.

LONDON, S.W.—F. B. L. writes: "It has been suggested that the white matter seen on one edge of the enclosed piece of teak is some form of arsenic, and that this permeates the wood, although invisible, and is the cause of the irritation of the skin set up when working teak. What is your opinion of this?"

Your informant is wrong in suggesting that the white matter is arsenical. It is apatite, or phosphate of lime which consolidates in the shakes. This is the substance that turns the edges of tools, and it may be the cause of the irritation of the skin set up when working teak.

OUR PLATE.

POWIS CASTLE, the seat of the Earl of Powis, is situated close to Welshpool, and is known by Welshmen as Castell Coch, i.e., the Red Castle, being built of red sandstone. It has recently been placed in the hands of Mr. G. F. Bodley, R.A., for reparation. The castle was previously restored by Sir Robert Smirke. The drawing-room, which we illustrate, retains the old bay-window masonry, but is now panelled in wainscoting throughout, with large chimney-piece to match the elaborate plaster ceiling.

The Bells of St. Saviour's (Southwark Cathedral) require re-hanging.

The Marylebone Borough Council have decided to oppose the Architects' Registration Bill on the ground that if it became law the council would have to employ a registered architect, as no one on the staff could comply with the provisions, and also because they would get a nondescript set of architects who would be able to charge large and unreasonable fees.

Birthday Honours.—The King has made the following appointments:—*Order of Merit*, Sir Lawrence Alma-Tadema, R.A., and Mr. William Holman-Hunt, the distinguished painters; *Baronet*, Mr. S. B. Boulton, head of a firm of timber merchants, of Totteridge; *Knights*, Dr. A. B. W. Kennedy, the distinguished civil and electrical engineer, and Mr. I. Spielmann, the well-known authority on art.

Correspondence.

Competition for Primitive Methodist Orphan Homes, Harrogate.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I agree with every word of "Harlow Moor's" letter in your issue of June 21st, and perhaps the following points will be interesting to the competitors, the majority of whom, I am sure, will agree with your correspondent's letter:—

(1) That the assessor managed to adjudicate upon over thirty sets of drawings in under three hours.

(2) That orders were given for the whole of the plans to be packed up and returned the same evening, and that the premiated designs were actually packed up by noon on the day following.

(3) That certain architects went down to the Primitive Methodist Church, with the object of viewing the drawings, and were refused admittance, and not until a strongly-worded protest was sent to the Rev. J. T. Barkley were the plans thrown open for inspection.

(4) I heard it stated in the Primitive Methodist Church on Tuesday afternoon, June 6th, that the committee did not care for the disposition of the buildings on the site as shown on the premiated block plan, and that they did not intend to adhere to this arrangement.

I think the least an assessor can do is to keep to the conditions issued to competing architects, which has certainly not been done in this case. It would be extremely interesting to hear the assessor's reasons for arriving at his decision.

It is perfectly easy for any architect to rearrange his plans, after having thirty sets of designs to choose from, and I am certain that the work cannot be carried out for the amount given in the conditions, and that to modify the plans will practically require a fresh set of drawings to get anywhere near the figure mentioned, viz., £1,000.

This is distinctly unfair to other architects who have kept to the conditions.—Yours truly, FAIRPLAY.

The Reconstruction of Glasgow Royal Infirmary.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In your issue of June 21st you publish scale elevations and a perspective sketch purporting to show relative dimensions of the proposed reconstruction of Glasgow Royal Infirmary and of Glasgow Cathedral. The scale drawings showing the relative ground levels and height dimensions we may take as being correct; but I wish to call attention to the perspective sketch, which I think fails from want of accuracy to effect its purpose. The object of these drawings, which appeared along with the published protest of the Glasgow Institute of Architects, the Art Club and the Archaeological Society, was to enable the reader to judge at a glance the overpowering predominance of the new infirmary front and the complete dwarfing of the cathedral.

A glance at the scale drawings shows that not only are the ground levels opposite the infirmary higher, but that the wall head and ridge of the infirmary are also much higher than those of the cathedral.

By the application of the most elementary rules of perspective to the sketch it will be seen that the two ridges almost coincide in height. Therefore I am convinced that the sketch is wrongly drawn. If the cathedral were shown about as much as one-third lower I think it would convey a more correct impression of the relative bulk of the two buildings.

How in such an important protest such an important point should have been overlooked

I am at a loss to understand. Possibly the protestors to save trouble have used the available competition perspective, which would not have been prepared to put the matter in its worst light. But if so, it is a pity that the effectiveness of the protest should have suffered by the want of a little care to make the drawing as correct and as convincing as possible.—Yours truly,

H. D. WALTON.

11, BOTHWELL STREET, GLASGOW.

Stalls and Rood Screens.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Mr. Herbert L. North's remark on p. 337 of your issue for June 14th last that at Conway and Llanrwst churches the choir and musicians were accustomed—until about half a century ago—to make practical use of the rood lofts over their respective chancel screens, needs some qualification. The query naturally arises from this statement, For what period? Certainly they were not built for that purpose. No credited writer upon the subject has ever ventured to make such an assertion. Further, when your correspondent adds, "This was undoubtedly the mediæval arrangement," he drifts hopelessly to sea. Wherever we find an old chancel screen we also find stalls or the record of such having existed in cathedrals and collegiate churches, of course almost invariably returned. True it is that upon particular festivals of the Church the jubé or rood loft was lit by wax candles (an item that frequently occurs entered in old church accounts). Probably musicians performed upon these lofts occasionally, but certainly they did not regularly do so in the Middle Ages. The Epistle, Gospel and Lessons were, some authorities affirm (see Clapton C. Rolfe's "Chancel Screens and Roods" 1876, for instance), read thereupon from a lectern for the edification of the faithful. But that the rood loft was primarily designed simply to carry the three sacred figures, none are disposed to dispute.

Mr. North remarks that a chancel measuring 16ft. by 12ft. could not contain a choir, but this is a mistake. The space quoted affords room for stalls and fronts giving ample accommodation for ten men and twelve singing boys. That would be quite as large a choir as any small village could be expected to raise.

The mention of the rood screens at Conway and Llanrwst churches recall other fine screens with rood lofts in North Wales. That, for instance, amongst them at S. Beuno at Clynog, on the north coast of the long arm of Carnarvonshire stretching westward, and known as the Llyn Peninsula. The screen is a late Perpendicular one of eight bays—groined on the western side only. The massive old stalls still retain their carved subellæ. Again, in the same locality is the church of S. Einion at Llanengan, situated some sixteen miles south-west of Clynog. It is as a building a less imposing fabric than is the latter's church, but possesses a finer and more perfect screen and rood loft. The screen extends across the nave and south aisle co-extensive with both, but the actual rood loft is over the aisle and not over the nave, a peculiarity also seen at Atherington in North Devon, where, however, the loft or gallery is over the north aisle. The western side is plain, the eastern is much ornamented. The returned old stalls, with their miserere exist here east of both screens (the actual choir seats are modern). The nearest station to this church is Pwllheli (eight miles.)

Yet another church that should not be missed is Llanegryn in Merioneth, some four miles (or rather more) from Towyn, a romantically situated and most typical mountain village church. It possesses neither tower nor aisle, and (as also West-country churches generally) has no structural separation between nave and chancel. It possesses,

however, a superb rood screen. In the upper oak beam of this screen may still be seen about a dozen holes, into which the ancient sconces for candles used to be fixed.—Yours truly,

HARRY HEMS.

FAIR PARK, EXETER.

Competitions.

Islington Central Library.—Mr. John Belcher, A.R.A., has selected the design of Mr. Henry T. Hare for this building from eight designs submitted.

Guildford Housing Scheme.—The town council have awarded the first premium of £20 to Mr. T. J. Capp. Messrs. Clemence & Moon and Mr. A. J. Sturges were the other competitors.

In the High Wycombe Schools Competition Mr. Arthur T. Greenwood, of Gorton, Manchester, was placed first; Mr. C. Harold Norton, of London, second, and Mr. Frank W. Mee, F.R.I.B.A., of Manchester, third.

Harrogate Infirmary.—The assessor in this competition—Mr. G. B. Bulmer, F.R.I.B.A.—has awarded the first premium of £25 to Messrs. H. E. & A. Bown, the second of £15 to Messrs. Bolshaw & Stevens, and the third of £10 to Mr. T. E. Marshall (all of Harrogate).

A Welsh Chapel.—In a limited competition for a new Welsh C.M. Church at Trefriw, North Wales, the committee have selected the design submitted by Mr. G. Dickens-Lewis, architect, of Shrewsbury. The work, which is estimated to cost £3,500, is to be proceeded with immediately.

Obituary.

Mr. E. Thomas, builder, of Worthing, died recently.

Mr. C. H. Jones, slate merchant, Enfield, shot himself recently on the Kemp Town golf links.

Mr. Isaac Lawrence, a well-known builder, of Wareside, near Ware, has died as the result of a cycling accident.

Mr. Charles Walker, of River Bank Mills, Preston, died recently. He was president of the Master-Builders' Association, and a member of the Walton-le-Dale Urban Council. He was head of the oldest building firm in North Lancashire, and undertook many important contracts, including the extensions of the County Offices, rebuilding the Theatre Royal, the Home for the Poor, Fulwood, the Poor-Law Schools, the Church of the Sacred Heart, Ashton, Larkhill Convent and churches at Skerton and Morecambe.

Builders' Notes.

A New Firm.—Messrs. Madley & Perry have started at Pengam, Cardiff, a business as builders and contractors.

The Nottingham Building Trade is stated to be at a very low ebb. Close upon 300 trade-unionist bricklayers are reported to be out of work and over 200 joiners are on the funds of their union. Many of the men have obtained work as harvesters.

The London Building Trades Conference held a meeting recently at St. Pancras Town Hall, Pancras Road, N.W. It was reported that the new suggestions of the London Master Builders Association for the future government of the building industry had been received, but not considered. Addresses were given by Alderman D. Hennessey, Mr. W. Lovatt and Mr. Davenport.

Keystones.

A Viaduct over the River Gaunless, on the North-Eastern Railway, is being constructed.

The Paris Municipality has purchased the contents of the studio of the late Jules Dalou, the well-known sculptor.

The South Parade Pier, Southsea, is proposed to be reconstructed. Its length will be increased to 625ft. and its width to 145ft.

A Stained-glass Window has been placed in the north aisle of Powderham Church. It was erected by Messrs. Drake & Sons, of Exeter.

An Extension of the Liverpool Docks is proposed at an estimated cost of £4,027,500. Considerable shedding is included in the scheme, which contemplates the utilization of 46 acres of water.

The Central Station, Glasgow, has been enlarged and provided with new lavatory, bath, dressing and hair-dressing rooms. The work was designed and carried out under the supervision of the Caledonian Company's engineer-in-chief, Mr. D. A. Matheson.

The Foundation Stone of the new Buildings of the University College of South Wales and Monmouthshire, at Cardiff, was laid recently by the Prince of Wales. The college scheme, when carried out in its entirety, will involve an expenditure of at least £290,000. Mr. W. D. Caröe is the architect.

Brixham Parish Church has recently been restored. The altar tombs have been repaired by Mr. C. Shives, of Brixham. The old wooden floor has been removed and the foundations covered with concrete, over which the aisles have been paved with Purbeck stone, the choir stalls with oak block flooring and the transepts with blocks of pitch-pine.

Harrogate Infirmary is to be enlarged at a cost of between £4,000 and £5,000. Among the additions will be a waiting-room, a new operating theatre, with anaesthetic room, stores and lavatories, &c.; and a ward on the first floor. The number of beds in the infirmary will be increased from forty to fifty-eight, and a number of additional staff bedrooms will be provided near the operating theatre.

A Tibetan Temple has been erected in the Colonial and Indian Exhibition, at the Crystal Palace, as an addition to the series of architectural courts. Around the temple are ranged a number of cases, in some of which are objects of the most sacred kind connected with the Tibetan worship of Buddha. Among them is an actual shrine of Buddha and an extraordinary collection of articles and curiosities illustrative of the life and civilization of the people.

Selly Oak Infirmary.—The King's Norton Guardians have approved plans by Messrs. C. Whitwell & Son for an extension of Selly Oak Infirmary, the erection of a nurses' home, and the extension of the isolation hospital, at a probable cost of between £25,000 and £30,000. The extension will increase the accommodation from 250 beds to 472, and provide new quarters for forty-eight nurses. The plans have been sent to the Local Government Board for provisional approval.

Dundee City Churches are stated to need restoration. Mr. James Thomson, the city architect, has suggested three schemes, namely, to clean and paint St. Clement's Church and clean down and remove loose parts of St. Mary's and St. Paul's Churches, at a cost of £550; to clean and paint St. Clement's Church and repair St. Mary's and St. Paul's Churches with cement, at a cost of £2,800; to clean and paint St. Clement's Church and thoroughly repair and restore with stone St. Mary's and St. Paul's Churches, £7,500.

New Parish Council-Chambers at Irvine have been erected at a cost of £1,500.

Hyde Abbey, Winchester, said to contain the remains of King Alfred, is proposed to be restored.

The National Committee for the Establishment of Sanatoria propose erecting a building at Beveden, Kent, to accommodate 200 patients. The estimated cost is £50,000.

Eastleigh's new Baptist Church, which will cost £3,200, is being constructed of red brick with Bath-stone facings. The architect is Mr. J. Wills, of Derby, and the builders are Messrs. Golding & Ansell, of Southampton.

A Window in Exeter Cathedral has been erected in the chapel of St. Mary Magdalene at a cost of £500. It has been executed by Burlinson & Grylls, and the design and treatment is similar to the great west window, by the same artists.

In East Budleigh Church, Devonshire, the fine carved pulpit designed by Mr. G. H. Fellowes Prynne, F.R.I.B.A., of London, has just had a further figure-group added as a memorial. This has been executed by Messrs. Harry Hems & Sons, of Exeter.

The new Primitive Methodist Schools and Institute at Walkley have been erected at a cost of £3,000. The buildings are faced externally with Dole Hills wall-stone, with stone dressings. Messrs. John Vasey & Sons, of Sheffield, were the builders, and Mr. William J. Taylor, of Sheffield, was the architect.

A Water Tower at Boston, Lincs, has been erected by the waterworks company. The tower is 60ft. high. The tank measures 4ft. 6ins. by 37ft. 6ins. and is 4ft. 6ins. deep, and has an effective capacity of 40,000 gallons. The foundations were put in by Messrs. Langley & Westmorland, of Kirton, and the building erected by Mr. John Lucas, of Boston.

Berwick's Old Fortifications.—An appeal is being made against the proposal of the Berwick Town Council to sell a site for a block of buildings on a part of the ancient Edwardian fortifications adjoining the section recently purchased by the Government. This would, it is stated, necessitate the levelling of the vallum and the filling up of the moat which was constructed by Edward I. and strengthened by King Robert the Bruce.

Bilton Church, Harrogate, has been fitted with a new organ, and new vestries have been added at a total cost of £2,500. The church was designed by the late Sir Gilbert Scott, R.A., and in these new additions his plans for an organ chapel, with choir and clergy vestries, on the north side of the chancel have been followed. The console is in oak and the pipes have been made in "spotted metal" as most fitting to this wood. The organ-builders were Messrs. William Hill & Son.

A new Monastery for the use of the Cowley Fathers and Brothers of the Society of St. John the Evangelist has been erected in Great College Street, Westminster, at a cost of £17,000. The building is of red brick. On the left of the porch outside the grille are two waiting-rooms for women. Through the main entrance there is waiting-room for men, lay brothers' sitting-room, servery and refectory, a spacious entrance hall leading to the community's door to the chapel, a long corridor and sacristy, and in the centre a staircase. The chapel is yet to be built. The basement contains kitchens, store-room and heating plant, &c. On the first floor are three libraries, another lay brothers' room and the Father Superior's study and cell. Next to the guests' common room is a sacristy, and the oratory over the west end of the chapel. The chapel will have an upper floor and a flat roof. The second and third floors are divided into twenty-three cells.

An Infectious Diseases Hospital at Preston is proposed to be erected at a cost of £20,000.

The Metropolitan Asylums Board propose building new central stores at an estimated cost of £29,000.

A Marble Statue of Queen Victoria, by Mr. Albert Toft, has been erected at Nottingham at a cost of £2,150.

The Commercial Travellers' Schools at Pinner have recently been completed by the addition of a hall and classroom.

It is proposed to bridge the Ouse at Goole at a cost of £22,000. Plans have been submitted by Mr. G. Bohn, M.I.C.E.

The new Parish Church of Kilninian and Kilmore, designed by Mr. McGregor Chalmers, was recently opened. It is Gothic in style.

A new East Window at Chichester Cathedral has been erected at a cost of £650. It was designed by Mr. C. E. Kemp.

Change of Address.—Mr. Arthur Stratton, A.R.I.B.A., architect, has removed his offices to 16, Hart Street, Bloomsbury Square, London, W.C.

The Bronze Statue of Bishop Creighton by Mr. Hamò Thornycroft, R.A., was unveiled in St. Paul's Cathedral by the Archbishop of Canterbury on Saturday last, in the south-east aisle.

Culloden Battlefield has been renovated. Messrs. Ross & Macbeth, architects, Inverness, supervised the work, and the gravestones and surroundings have been dealt with in a sympathetic manner.

Cape Town's new Municipal Buildings (commenced in 1899) have been completed. The main hall, which will accommodate 1,000 people, is 60ft. high, 130ft. long and 6ft. wide, and is elaborately decorated.

In Kingston Public Library a stained-glass window has been erected as a South African memorial. The work was executed by Messrs. James Powell & Sons, of the Whitefriars Glass Works, E.C.

A new Primitive Methodist Chapel at Chester-le-Street is being erected at an estimated cost of £2,200. Mr. C. Groves, of Chester-le-Street, is the builder, and Messrs. Boyd & Groves, of Emmerson Chambers, Newcastle, are the architects.

The new Methodist Church at Dovercourt has been completed. It is Gothic in style, with woodwork of pitch-pine. The cost, including the site, was £1,950. Mr. H. Jolley, of Eltham, Kent, was the architect, and Messrs. Spencer, Santo & Co. were the builders.

The Historic Parliament Hall at Edinburgh, which now forms part of the Court of Session buildings, is to undergo considerable renovation. The hall, which was completed in 1639, was built as a meeting-place for the Scottish Parliament on Estates, and was so used down to the Union in 1707. The renovations proposed include a new parquet floor of oak and teak, the re-decoration of the walls, and the cleaning of the valuable pictures with which they are lined. The work will be carried out under the superintendence of Sir James Guthrie, President of the Royal Scottish Academy.

Dalton's Carnegie Free Library, erected at a cost of £3,000, was recently opened. The exterior is faced with Elliscales limestone with Cumberland freestone dressings, and the interior with stucco and part-glazed tiled dados. The roofs are covered with Kirkby slates; the ground floor is paved with terrazzo and wood blocks; the public rooms on the first floor are covered with cork matting and silent treads to all stone steps; the ventilation is on the so-called "natural" system, and the heating is by low-pressure hot water. Messrs. Ashburner, of Elliscales, Dalton, were the contractors, and Mr. W. Richardson, of Dalton, was the architect.

Complete List of Contracts Open.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
BUILDING:			
July 6	Gainsborough—School	Education Committee	Scorer & Gamble, Bank Street Chambers, Lincoln.

RURAL BY-LAWS.

THE Public Health Acts (Amendment) Bill, which has been referred to a Select Committee of the House of Lords, is designed to facilitate the erection of cottages and small houses, especially in country towns and rural districts, where the want of accommodation for workmen and labourers is acutely felt, and at the same time to free other houses with plenty of land round them from the restrictions imposed by the existing by-laws. Mr. Justice Grantham, giving evidence before the Select Committee, recently said the model by-laws were a vast improvement on the old by-laws, but, strange to say, they were so drafted as to be absolutely inconsistent with their intention in certain parts. The Local Government Board ought to take power to amend their by-laws or to withdraw them. With regard to the main principle of the Bill, exempting cottages with sufficient space around them from the operation of by-laws as to structure, he thought that, considering that in the London by-laws there was this provision, it was extraordinary that it should not be given in the country. Such exemption would practically provide for the main difficulties which now beset the landowner desirous of providing accommodation for rural labourers. He strongly urged that power of appeal should be given against orders of the rural district council before those orders could be enforced or proceedings taken before a court of summary juris-

diction. The appeal should be to the county council. The relief from the necessity to furnish plans which the Bill would afford would be of great value. Sir W. Grantham added that many of his own friends to his own knowledge intended to build, but

declined when they found the worry they would have to undergo by the irritating provisions of the existing by-laws. Many small builders had, he knew, been stopped by them, while many had been almost ruined by them.

MONTHLY

FIRE SUPPLEMENT

TO THE

BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

Edwin O. Sachs, F.R.S.Ed., Architect,
Consulting Editor.

Number 9.
July, 1905.

PARLIAMENT AND FIRE- PREVENTION.

THE attention which is at present being accorded to matters of fire-prevention is probably quite unique in the annals of the House of Commons. In the first place there is a Committee sitting upon the London County Council's "Building Act Amendment Bill" for the county area, which Committee is also considering the City Corporation's "Escape from Fire Bill." Besides this, a "Select Committee" has been appointed to consider the question of escape from fire generally throughout the country. As the exact terms of the reference to this "Select Committee" are not generally known, we present the reference in full.

We trust the Select Committee will give very careful attention to the problem in its entirety, and if necessary will even have the terms of its reference extended to such questions as the escape from fire in places of worship.

The reference is as follows:—

"That a Select Committee be appointed to enquire as to the provision of means of escape from fire in factories, workshops, laundries, offices, shops, hotels and other buildings where persons work or live in large numbers, and to report what changes in the law are necessary for the protection of life, having special regard to the case of buildings in the occupation of more than one occupier.

"That Mr. Arkwright, Mr. James Bailey, Mr. Brigg, Mr. Munro Ferguson, Mr. Vincent Kennedy, Mr. Malcolm, Mr. H. L. W. Lawson, Mr. Norman, Mr. Ridley, Mr. Soames and Mr. Tuff, be members of the Committee.

"That the Committee have power to send for persons, papers and records.

"That three be the quorum."

FATAL FIRES IN LONDON.

With Remarks on Provisions Needed to secure the Escape of Persons endangered by Smoke or Fire in Buildings.

By JAMES SHEPPARD, A.I.E.E.,
Fire Insurance Surveyor.

THE loss of life by fire in the county of London, notwithstanding the efforts made and appliances provided for the prevention of such loss, has increased more rapidly than the increase of population, improvements in one direction being more than balanced by fatalities from other causes. The returns available for recent years are doubtless more complete than is the case for earlier years; on the other hand, these returns show that the number of lives lost at single fires during the past nine years is greater than previously experienced.

The average annual number of lives lost by fire during the years 1901-04, as shown by official returns, was ninety-eight, while the average number for six earlier periods of five years each ranged from 29.4 to 96.8 per annum.

It is satisfactory that the rate of increase during earlier periods has not been main-

tained, giving promise that the future will show a considerable reduction on the present serious loss of life by fire.

An analysis of returns published in the annual reports of the London Fire Brigade contained in the tables annexed proves that more than 80 per cent. of all deaths by fire occur in dwellings occupied in the majority of cases by more than one family, and that 83 per cent. of all persons who lose their lives by fire are females and children under five years of age. The clothes worn by women and young children are very liable to come in contact with and ignite at domestic fires, stoves or lights, or from the burning wick of an upset lamp. Such fires are difficult to extinguish before fatal injury may have resulted, especially if the clothes have been sprayed with mineral oil from a broken lamp reservoir, as is frequently the case.

The three boroughs of Stepney, St. Pancras and Southwark, out of the total twenty-nine cities and boroughs constituting the county of London, were alone responsible during 1901 to 1904 for nearly one-third of the total number of deaths by fire that occurred in dwellings. In very many of these cases the first material to take fire, as a consequence of conditions previously referred to, was the clothes of the victim; when this occurs all provisions for escape or for outside assistance are of no avail. Persons so involved have to rely on their own presence of mind or the instant assistance of some person present at the time. Fatal cases of this nature can only be avoided by the exercise of reasonable intelligence and care in the use of fires, lights and matches.

The London County Council are now the statutory authority both for saving life from fire and for public education, and therefore have every opportunity of giving suitable reading and other lessons by which the methods and importance of using fires, lights and matches with intelligence and care would be impressed upon their scholars.

Persons endangered by poisonous gases, smoke or fire in a building instinctively and wisely seek to reach the outer air at the earliest possible moment, usually making for the roof or a window. From ten to twelve persons each year in London escape with their lives by jumping from windows, and most of the rescues effected by fire brigades are made from roofs or windows. Any provisions for escape from fire to secure the best results must take into account this instinctive action of endangered persons.

Easy access to the roof, with provision for reaching adjoining roofs, meets this requirement in an admirable manner so far as the upper floors of buildings are concerned, and continuous outside balconies passing as many windows as possible, each window affording free access to the balconies, would provide an effective escape from other floors. The balconies should preferably lead to an enclosed staircase having doors opening

only to the outer air, on to the balconies, but this would not be essential in some cases where efficient portable fire-escapes are quickly available and portions of the balconies are sufficiently protected against fire from openings in the building.

Enclosed staircases in lofty buildings having doors opening direct into each storey may prove death traps for persons escaping from the upper floors. In the event of fire in the basement or ground floor of a building having an enclosed staircase with doors as described, smoke and poisonous gases could pass through the door openings over the heads of persons escaping from the lower floors, or these doors may and probably would be blocked open; the staircase enclosure would therefore be quickly filled with a suffocating atmosphere by which persons escaping from upper floors may be instantly rendered helpless and unable to make good their escape.

The instantaneous effect of inhaling atmosphere charged with the products of combustion, especially on persons escaping for their life, is not sufficiently realized. In nearly all fatal cases (except where the first thing to take fire is the person's clothes) the victims are rendered insensible before any fire reaches them. In fatal theatre fires where it has been considered that some obstruction on a staircase was responsible for loss of life it will be found on closer examination that the only real obstruction resulted from persons falling down insensible from inhaling poisonous gases.

The insidious and dangerous nature of atmosphere exhausted of oxygen and charged with the products of combustion, even if free from smoke, was shown in the case of a small fire at Whiteley's on April 19th last, when several firemen thoroughly accustomed to deal with similar cases were rendered insensible. If firemen succumb the general public cannot be expected to escape down an enclosed staircase filled with an atmosphere of this nature.

The following particulars with reference to fatal fires in London are given in Tables I. to V. annexed:—

Table I.—Number of fires at which life was lost or endangered during periods of five years from 1871-75 to 1896-1900 and for the four years 1901-04, distinguishing between fires in dwellings and in trade premises.

Table II.—Number of lives lost at each fatal fire during the above periods in dwellings and in trade premises.

Table III.—Occupation of premises where fires occurred by which life was lost or endangered during the four years 1901-04.

Table IV.—Number of fatal fires and lives lost in each of the cities and boroughs in the county of London during the four years 1901-04.

Table V.—Causes of fatal fires in the county of London during the four years 1901-04.

Fatal London Fires—cont.

TABLE I.—Number of fires at which life was lost or endangered in the County of London during periods named, distinguishing between the number of fires and lives lost or endangered in dwellings and in shop and trade premises, compiled from the annual reports of the London Fire Brigade.

FIG. 1.—THE COLUMN TESTING PLANT AT NEW YORK IN 1896. The illustration shows the testing chamber with steel frame for application of hydraulic power, also gas-producer and boiler.

FIRE TESTS WITH UNPROTECTED STANCHIONS.

ALTHOUGH it should be obvious by this time to any civil engineer or architect that it is impracticable to use unprotected columns and stanchions in building construction if there is to be the slightest semblance of fire-resistance in their buildings, yet it remains a fact that, no matter what the experience has been, some of our conservative professional men are still using unprotected steelwork and ignorantly describing it as "fireproof." The lessons at actual fires during the last twenty years should have been sufficient to prove that even the best steelwork or best cast-iron columns are useless, as far as fire-resistance is concerned, if not properly protected.

This fact is so obvious that the British Fire Prevention Committee, which is generally ready to undertake fire tests with work in general use, on public grounds, drew the line at proving this fact at their testing station; yet we would almost wish that a systematic series of experiments had been conducted by them with stanchions and columns, both

protected and unprotected, so that the facts could have been scientifically recorded for reference purposes.

As the matter stands at present, there have only been three series of tests anywhere in the world intended to show what should be obvious, but which was certainly not properly realized at the time of these experiments, nor, as a matter of fact, even to-day. We refer to some tests taken in New York City with two stanchions and three columns, to a series of tests undertaken by the municipality of Hamburg with sections of columns and stanchions, protected and unprotected, and to some investigations at Munich with stanchions, columns and piers.

Regarding the American tests, they were the first so-called independent tests in the United States, inasmuch as they were arranged by the professional bodies concerned, namely, the architectural and engineering societies of the United States. Unfortunately these experiments came to an untimely end owing to disagreement, and what promised to have been a most valuable standing institution in the United States came to grief without having done much good. It is, neverthe-

less, interesting to search the records and present the results of two of the tests undertaken at the time in respect to unprotected stanchions, for though of short duration the arrangements for the tests in question were quite excellent.

The stanchion tests were undertaken as far back as 1896, but are scarcely known in this country. The plant which was put up for these investigations was a very up-to-date one for that time, and in a way served as a guide to what was afterwards done in 1898 by the Fire Prevention Committee of this Metropolis.

The testing chamber for these New York tests comprised an arched brick building as shown in our illustration, the fuel being gas from a generator supplemented at times by a spray of naphtha. To procure the necessary pressure on the column during the investigations hydraulic power was used, whilst the temperatures were taken with the aid of a pyrometer.

It is well to present the results of some of these early investigations at a time when so much controversy rages round our proposed London Building Act. Thus, for instance, if

FIG. 2.—THE STANCHION USED IN TEST NO. 1.

FIG. 5.—THE STANCHION USED IN TEST NO. 2.

there were any more forcible demonstration required as to the necessity of the proposed enactment requiring all metalwork to be protected by zincs. of fire resisting material, one need only view the photographs we present on this occasion to see how essential and how useful the proposed enactment would be.

Space prohibits our presenting particulars of the column tests undertaken at New York, but the records of the two stanchion tests

presented herewith with the logs of the tests should suffice.

Column* Test No. 1.

Fire test without water. Steel column.
The walls of the furnace were of common brick, and the door was closed with a double thickness of sheet iron, which made the opening practically tight. The column was a Carnegie steel box channel of the dimen-

sions as shown in the illustration (Fig. 2), and was unprotected.
The weather was clear and warm, with only a slight breeze from the west. Temperature of air, 80 degs. Fahr. in the shade. The gas producer was fired the day before, with valve closed against furnace. The packing in the hydraulic cylinder leaked, and the fitting of the pipe gave out as test started. These causes delayed the use of the water pressure.

* In America a stanchion is also known as a column.

FIG. 3.

FIG. 4.

FIG. 6.

FIG. 7.

LOG OF TEST (COLUMN TEST No. 1).

Time.	Pyrometer.	Hydraulic pressure.	Remarks.
H.M.	Degs. Fahr.	Tons.	
10.35	Wood fire lit.
10.45	Gas turned into furnace.
11.02	Furnace door closed.
11.03	Naphtha valve slightly opened.
11.13	Pyrometer put in furnace through lower hole, 2½ft. above the furnace door, with point 12ins. from column.
11.19	1,025	...	Pressure on column. Light load. Pyrometer point 24ins. from column.
11.20	1,050	...	Raking gas-producer, gas shut.
11.25	600	...	Gas turned on again.
11.28	No naphtha.
11.33	1,025	...	Half faucet of naphtha.
11.36	1,225	...	
11.38	1,200	...	
11.40	1,175	14.13	Water pressure on.
11.41	1,180	28.26	Quarter faucet of naphtha.
11.46	1,175	...	Pressure off, water valve repacked.
11.50	1,175	...	Closed all air openings. Water pressure on.
11.55	1,200	48.06	Column began to show "red."
11.59	1,210	...	Column began to yield.
11.59	1,225	42.41	Hydraulic pressure falling fast.
12.10	1,230	...	Pyrometer shut off. Pyrometer raised to upper hole, 8½ft. above floor, and point 3ft. from column.
12.16	1,230	...	
12.25	1,250	...	Gas shut off.

The column would have failed sooner if the working load of 80 tons could have been used.

The result of the test is shown in the flashlight photograph (Fig. 3) taken of the column before it was disturbed. After the column was removed from the furnace, photograph (Fig. 4) was taken. The brick walls cracked, the greatest damage taking place where one wall was bonded into the next,

and the cracks at these places extended through the bricks. Along the horizontal joints the walls cracked most on the bond courses. All the walls were hot, the 8in. wall being too hot to hold the hand in contact with it.

Strength by Gordon's formula:—

Breaking strength per sq. in. ... 45,630 lbs.
Area of cross section ... 15 sq. in.
Breaking load, 15 by 45,630 ... 684,450 lbs. 342 tons.

Actual greatest load, cold, 141¼ tons, with no change of form.

Column Test No. 2.

Fire test without water. Steel column. Furnace same as Test No. 1.

The column was a Carnegie steel Z-bar, as shown in illustration (Fig. 5), and was uncovered. The weather was clear and warm, with a moderate breeze from the north-west. Temperature of air, 80 in shade.

The result of this test is shown in Figs. 6 and 7.

The Professional Fire Service Association of Germany held its annual meeting at Bremen during the past week, when a considerable amount of valuable work was carried through on the fire-preventive side, this work having special relation to improved forms of building construction and of theatre safety. There were a number of valuable papers and also much useful discussion. It is a matter of moment to observe that in future the German professional fire-brigade officer will have to be a Royal Engineer, or he must have passed the statutory examinations of an architect, surveyor or civil engineer. Thus the growing tendency of making the professional fire service of Germany a technical profession in the best sense of the word is apparently to be carried out in the most energetic manner. Of the fifty-nine professional fire brigades in Germany nearly all are already officered by members of the technical professions.

EFFECT OF FIRE ON A FACTORY IN WHICH THE CAST-IRON COLUMNS HAD NOT BEEN PROTECTED.

LOG OF TEST (COLUMN TEST No. 2).

Time.	Pyrometer.	Hydraulic pressure.	Remarks.
H.M.	Degs. Fahr.	Total load Tons.	
2.23	80	...	Pyrometer point 3ft. from column.
2.24	200	84.8	Wood fire lit.
2.30	850	"	Gas turned on.
2.33	...	"	Door closed. Full cock of naphtha.
2.35	1,000	"	One-quarter cock of naphtha.
2.36	1,300	"	
2.37	1,350	"	
2.38	1,375	"	Naphtha closed.
2.39	1,300	"	
2.40	1,125	"	One-eighth cock of naphtha.
2.40½	1,300	"	
2.41	1,325	"	
2.42	1,250	"	
2.43	1,200	"	
2.44	1,175	"	Naphtha cock closed to "dropping."
2.45	...	"	Pyrometer moved to 2ft. from column as flame touched point.
2.46	1,125	"	Column began to yield.
2.47	1,125	"	Column yielding fast.
2.49	1,100	"	Impossible to maintain hydraulic pressure.
2.51	1,100	"	Pump and gas stopped.
2.52	900	"	Pyrometer closed.

THE NEW TESTING STATION.

THE British Fire Prevention Committee's new testing station, which was opened on June 28th, is situated off Lodge Road, Regent's Park. This is Committee's third testing station, the first being in the same neighbourhood and opened in 1898, the second in Bayswater and opened in 1901.

That the Committee should have so frequently removed its station, and should have always occupied sites where the tenure was terminable at short notice, is due to the fact that the primary principle in selecting the location for a testing station has always been its proximity to Charing Cross and its accessibility from all parts of London. The principle laid down has been that unless the testing station has been within easy cab distance from Charing Cross it would be impossible to obtain, as workers, those members of the Committee who are best able to conduct the operations, of whom the majority are busy men. Any question of having to catch trains to the outlying suburbs, or not being easily available if wanted, whilst at the testing station would practically prevent their active co-operation. Suitable sites within easy reach are most difficult, however, to find, and mostly only on property belonging to public authorities or corporations who have land temporarily idle awaiting the extension of their own works. It is on such property that the testing stations have always been housed and have from time to time had to make way for public works. It would have certainly been far more economical to have immediately taken a testing station some thirty miles outside London, and to have had no removal of plants; but from the technical point of view, *i.e.*, that of getting the best available technical advice and supervision gratuitously, the present policy as to location has been adopted as the only possible one, even if involving great expense.

The New Plant.

The new plant for testing building materials, systems of construction, &c., comprises a set of four testing huts, in which floors, partitions, doors, ceilings, &c., can be tested together with the necessary equipment. Three of these huts were ready for the opening day, two measuring 20ft. by 10ft. and one 20ft. by 15ft. The huts are laid down in two rows, and their construction is explained by the photograph showing a view of the plant, or more particularly of hut No. 1, which can be converted to various purposes. The materials used in their construction are stock bricks with lime mortar, the builders being Messrs. Pitcher & Son, of London.

The fuel generally used is gas, produced on the spot by a generator supplied by Messrs. F. W. Mason, Ltd., of Manchester. The gas is conveyed from the generator by pipes to the

several huts, and the supply is regulated by valves and dampers, and as the gas enters the huts from the branch pipes it is diffused by means of mixing chambers of firebrick as shown.

Each hut has door openings, ventilation and observation holes, the doors being closed by brickwork during a test, and the ventilation holes blocked, according to requirements, by firebrick or fire-clay.

Each chamber for a floor test allows for the floor under investigation to be placed at least 8ft. above the floor of the hut. The chambers are roofed in with galvanized iron or tarpaulin, when necessary.

Bricks or pig iron are used for any loads that may be applied to floors under investigation, and water is applied from a steam

ing appliances, such as thermostats, sprinklers, &c. Similarly, arrangements have been made for conducting special tests with lamps, stoves, electrical apparatus &c.

The Opening Tests.

The tests on the opening day were as follows:—

Two pairs of horizontal wire-glass skylights by Messrs. Pilkington Brothers, of St. Helens.

Two patent wood doors in frames by Messrs. Gilmour Door Co., of Canada and London.

A "tile" floor by the National Freproofing Co., of Pittsburgh, U.S.A.

The first of these tests with wire-glass skylights was for classification in the "temporary protective class" (class A). Thus these skylights had to withstand a fire test of 45 mins. duration running to a temperature of over 1,500 degs. Fahr., followed by the application of water for 2 mins.

The wood doors, one of which was 1½ ins. thick throughout and the other of which was a 1½ ins. panelled door, were intended for classification in the "temporary protective" (class B), thus being practically identical with the first-named test except that the duration of the test was for 60 mins. instead of for 45 mins.

The official reports of the results of these tests will be issued in due course, but in the meantime it might be of interest to say that the skylights, the 1½ ins. solid door and the floor in question apparently attained classification.

The Opening.

There was no formal opening of the testing station, but the plant was informally started by Sir William Preece, K.C.B., F.R.S., who took the opportunity to address a few

THE NEW CONVERTIBLE TESTING CHAMBER.

fire engine or from a manual pump, as required.

Records of temperatures are taken as far as possible by pyrometers. The instruments used are recording pyrometers, designed by the late Sir William Roberts-Austen, K.C.B., F.R.S., and manufactured by Messrs. James Pitkin & Co., of London. They rely for their indications on the measurement of the current generated by thermo-junctions, which are placed in various parts of the huts. Temperatures up to 3,000 degs. Fahr. (which is 500 degs. Fahr. higher than has so far been required at the testing station) can be read.

Visual observation as to work under investigation are also recorded, as far as possible by photography.

Deflections are measured by level and staff or by weights and pulleys.

There is a supplementary equipment available for any necessary laboratory tests with fire-preventive, fire-alarm and fire-extinguish-

words to the assembled members of the Committee. He laid stress on the fact that the work was being carried out by voluntary effort on the part of a number of professional men, and that these efforts were supported entirely by voluntary subscriptions and donations. As the senior member of Council and one of the first supporters of the Committee's movement for some eight years, he expressed his surprise that whilst the public authorities give moral support to the work and encourage it, this support has scarcely ever taken the form of financial aid. The public authorities financially supporting the work were quite the exception, and, curiously, these exceptions were partly Continental authorities. Sir William Preece considered the time had now arrived when municipal and also Government grants could well be sought, as the work had proved itself so efficient, so independent and so useful.

The attendance at the tests was much as

usual, but included several distinguished visitors, among others being Commandant Welsch (the leader of the Belgian Fire Preventive Service), Sir Thomas Pile, Bart., and Colonel Winn, R.E. Representatives of the Government Departments, the London County Council and other public offices were present.

Impending Tests with Proprietary Work.

The following are on the list of impending tests with proprietary work; those next in rotation will take place towards the end of July:—

- (1) The Asbestic Brick and Tile Co. (London). A test with a partition of asbestic bricks. (2nd test.)

THE AUTOPYROPHONE THERMOSTAT.

- (2) Messrs. Coignet (Paris and London). A test with an armoured concrete floor on the Coignet system.
- (3) Messrs. Faber (Berlin). A test with a floor. (July.)
- (4) Messrs. Gibson & Co. (London). A test with a roller shutter. (July.)
- (5) The National Fireproofing Co. (U.S.A.). A test with a tile partition. (July.)
- (6) The New Expanding Metal Co. (London). A test with a floor and girder coverings.
- (7) Messrs. Jabez Thompson (Northwich). Tests with protective coverings to stanchions.
- (8) Messrs. Skelton & Co. (London). A test with a floor of broad flange-girders and concrete. (July.)

New Member of the Executive.

Mr. Oswald C. Wylson, F.R.I.B.A., replaces the late Mr. Ellis Pritchett, F.R.I.B.A., on the Executive.

AUTOMATIC FIRE ALARM TEST.

REPORT No. 94 of the British Fire Prevention Committee deals with a series of tests with an automatic fire alarm system put forward by the Autopyrophone Co., of Copenhagen. There are seven tests, of which the objects are given below. Speaking generally, the objects of the test were fulfilled.

The appliances under review are of considerable interest, and open up a new field in automatic fire alarm design, based upon the relative rapidity in the increase of temperatures rather than the attainment of specific temperatures. The appliances seem, however, still to be somewhat in the laboratory stage, requiring simplification for actual use on a large scale.

The tests, which from the lengthy report appear to have been of a very laborious character, are no doubt the most elaborate tests of their kind conducted by the British Fire Prevention Committee, and the results are recorded in great detail.

The preface to the report, written by Mr. James Sheppard, A.I.E.E., is one which, we think, however, requires publication in full, and thus we present it. It refers very pointedly to one of the causes of the Baltimore conflagration:—

Object of Tests.

Tests A¹, A², A³.—To ascertain the temperature and time at which danger and fire calls would be given by the Autopyrophone Detectors on indicators, after the temperature had been artificially raised by gas stoves at different rates of increase—to simulate a smouldering fire.

Tests B¹, B², B³.—To ascertain the temperature and time at which danger and fire-calls would be given by the Autopyrophone Detectors on indicators and bells, after a fire has commenced, causing a moderate increase of temperature, and also the amount of damage shown when the fire has been extinguished by hand appliances after a lapse of three minutes from the first fire-call.

Tests C.—To ascertain the working of provisions for avoiding a fire-call from any fault on the system; and also if all faults that may arise will at once give a trouble-call, or can be readily discovered by testing the plant; further, if in any exceptional case a danger-call is caused by some unforeseen occurrence, other than a fire, i.e., exceptional heating of short duration, there will be time enough to discover and remedy such occurrence before a fire-call would be given.

Observations by James Sheppard, A.I.E.E.

The importance of fire brigades receiving the earliest possible notice of the outbreak of fire in their respective districts is universally recognized.

Having this object in view, fire brigade authorities responsible for the protection of important centres provide and maintain throughout their territory numerous public fire-alarm points, with extensions in some cities inside

private premises, having electric connection with brigade stations, for use by watchmen or other persons who may discover outbreaks of fire.

The provision in a similar manner of thermostats or automatic fire detectors throughout private establishments, having electric connection with suitable indicators, preferably placed in the nearest fire brigade station, simply constitutes a further development of the fire alarm systems above described.

In the automatic fire detector, consisting of a "differential" and a "fixed" part, known as the "Autopyrophone," which has been subjected to the tests described in the following report, pressure of vapour from a volatile spirit, resulting from expansion under increase of temperature, is applied to a column of mercury in a glass tube, causing displacement of the mercury with the consequent opening of a closed electric circuit, this being arranged so as to close a secondary open circuit by which signals are given for transmission to any desired position.

With every provision for securing notice automatically of faults or other contingencies that may arise in connection with electric circuits, as used in the systems under review, it is nevertheless desirable to make daily tests to definitely ascertain that every part is in working order.

It is also necessary that every signal or call that may be given should receive instant attention.

The importance of this was shown by the Baltimore conflagration of the 7th and 8th of February, 1904. The Hurst "Stores," where this conflagration originated, were equipped with automatic alarms, from which a trouble or danger signal was received, but as the establishment at the time was closed without watchman or other person on the premises, this first signal, which was really the commencement of a fire-call, was disregarded. Twenty-five minutes later a definite fire-call was received from the automatic alarms, and promptly responded to by the fire brigade, who were then (owing to the great extent and nature of the building with its open stair and lift shafts, light wells and inflammable contents, part of which under the action of heat freely gave off gases or vapours leading to an explosion sufficient to break the window glass) unable to control the fire, which ultimately spread over 140 acres covered with buildings, causing a loss of ten millions sterling.

The National Fire Brigades' Union devoted last week to a series of most instructive competitions in the Crystal Palace grounds, where a large number of men were also under canvas. It is interesting to observe that the number of chief officers of volunteer fire brigades who are borough surveyors or borough engineers of their localities is rapidly increasing.

Combined Fire-Engine and Fire-Escape.—At the instance of the Beckenham Fire-Brigade, Messrs. Bayleys (Ltd.), of Newington Causeway, have fitted one of their horsed fire-escapes with an appliance which is designed to enable a jet of water to be thrown on a fire as soon as the escape arrives, without the delays which may be occasioned while the firemen find a hydrant and make the necessary connections. It consists of a copper cylinder holding 24 gallons of water. Connected with it there is an ordinary steel cylinder of compressed air by the aid of which the water can be forced out along 150 ft. of hose.

HOMAN'S STEELED CONCRETE FIREPROOF FLOORS.

Constructional Steelwork of all kinds.

ROOFS, BRIDGES, PIERS, JOISTS AND GIRDERS.

ALSO

GRANITE PAVING, ASPHALTE, &c.

ADVANTAGES OF THIS CONSTRUCTION.

- Cheapest form of Fireproof Construction extant.
- Less Steel than other Systems.
- Bays securely tied together.
- Less thrust on Walls.
- Spans to 30 ft. without main Girders.

THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

July 12, 1905. Vol. 22, No. 544.

6, Great New Street, Fetter Lane, E.C.

Summary.

No improvement can be recorded in the London trade for the month of June, and the deliveries from landed stock have fallen off again by something over 2,000 standards, but this is to some extent compensated by a better delivery over side. (Page 22.)

A ferro-concrete linen factory has been erected in Belfast. Having regard to the delicate nature of the fabrics made, it was essential that the new factory should be as nearly as possible free from dust, and that the ill-effects of machinery vibration should be absent. After careful consideration the Hennebique system of ferro-concrete was adopted for the floors. (Page 22.)

The bleak countryside north of the town of Morlaix recalls in its natural features, in its history and in its people the "Old Cornwall" across the Channel. In both provinces are the same granite rocks, the same bleak and romantic landscape, the same austere and uncouth art, the same mingled tradition of Christian faith and heathen superstition. It is useless to look for architecture of the more elaborate kind in a country which can never have been wealthy, where the staple material is granite, and where it is a difficult matter to build snugly and tightly against the keen weather. (Page 16.)

Foundations of stanchions and piers taking a heavy load should be built in pedestal form and the stones under the heavily loaded portions not projected more than the transverse strength of the stone will safely sustain. (Page 23.)

The monument to the late Lord Salisbury in Westminster Abbey will take the form of a recumbent effigy, and will be carried out by Mr. Bodley and Mr. Goscombe John. (Page 24.)

Mr. A. Drury, A.R.A., is to be paid £1,200 by the London County Council for the modelling and casting of each of the eight panels for Vauxhall Bridge. (Page 27.)

The fixed drying oils are alone used for making paints. They dry by absorbing oxygen from the air, and only those which absorb a considerable quantity are valuable, and of these linseed practically holds the field. Linseed oil is obtained from the seed of the flax. The two chief qualities of linseed recognized in the trade are the Baltic, which grows in the north of Russia, and the Black Sea, which is grown in the south of Russia. The Baltic seed is the best. The East India seed from Calcutta is inferior in quality to the Russian. Linseed oil is often adulterated, principally with mineral and rosin oils, and occasionally with cotton seed, niger seed and whale oils, and there have been many substitutes proposed, but while the price of linseed oil is low there is no particular advantage to be derived from their use. Even for the cheapest work architects will be well advised to rigidly specify linseed oil and give no loophole for the use of any substitute. (Page 26.)

Iron Architecture. SIR WYKE BAYLISS has on several occasions made remarks which show that he is no exception to the general rule that painters do not appreciate what the art of architecture is. They talk glibly either of the poetry of architecture or relegate it to the position of that commercialism generally misnamed "engineering." Sir Wyke Bayliss is kind enough to say that he does not think that architecture is necessarily on the down-grade in England, though he considers that engineering has to a great extent taken its place as an art. What we need now, he says, is a genius who will deal artistically with iron, making it as beautiful as the architects have made stone beautiful in the past. Why not dot the country, he suggests, with poems in iron, as for centuries we have done it with poems in stone? This is all very well, but iron is not a material of pleasing colour or texture, nor so pliable as stone for decorative purposes. Cast-iron, it is true, allows of some variety of treatment, but its use is restricted by the necessity of making a model for the casting. One cannot carve in iron, and it is contrary to the constructive laws of steelwork design to twist and twirl it about. Steelwork has its uses, and when logically employed is architectonic, but it will not fulfil every architectural function. It must and ever will remain but a part of architecture, and under some conditions may be the most important part, but it never can be the be-all-and-end-all of architecture.

The Hoarding Nuisance.

A CORRESPONDENT of the "Times" calls attention to a subject which, in its general bearing, is undoubtedly of considerable importance to the business community. An unsightly hoarding at the upper end of Charing Cross Road was erected two years ago for the purpose of removing the public lavatories, the cost of which was borne by the Charing Cross, Euston and Hampstead Railway Co., to make room for the underground railway station which they proposed building. This work was completed on July 13th, 1904. In the early part of September last the railway company erected the present hoarding for the purpose of building the underground station, and this hoarding is likely to remain for another eighteen months. Owing to the tunnelling that is going on the road continually subsides and has to be closed to traffic for repairs. Firms having their offices and commercial premises in this thoroughfare naturally object to the loss of trade resulting from this cause. They feel aggrieved that the company can obtain by Act of Parliament the right to injure their business by work which is chiefly to benefit the company's

shareholders. In addition to this trouble the road is blocked with carts loading and unloading. It seems only fair that in such a case as this some compensation should be paid to persons whose interests may be affected. This is but another instance of what is continually going on in building operations, and we cannot see that it is legitimate for people to be interfered with in this way. Where a street is a narrow and busy one building owners should be forced to pay for the cost of keeping the roadway open by taking special precautions to avoid subsidences and the obstruction caused by carts loading and unloading. If carting must be done during business hours the carts should be drawn within the hoarding and the materials hoisted from the interior. The question of scaffolding is not an insurmountable one either, because a platform can be constructed to leave the footpath clear underneath; and when steel frames are adopted, as is now becoming more and more the custom, the scaffolding can be suspended from the framework in the American manner.

Enlightened Criticism.

ARCHITECTS have often bewailed the fact that the daily press neglects architecture, and have wished that modern buildings might be criticized in the same way as the drama and music. For our own part we have looked upon the proposal as rather a doubtful blessing. The profession should recollect that whenever the public has taken a fervid interest in architecture the result has been to set the clock back—the Greek and Gothic revivals, for instance. However, the "know-alls" of the daily press have recently distinguished themselves in criticism of architecture by praising the Hotels Cecil and Russell, and now the "Manchester Courier" publishes the following instructive note:—"In consequence of the growing use of ornamental glazed tiles for architectural decorations, London bids fair to become a city of many colours. We have already some buildings with yellow, blue, terra-cotta and white tile fronts, and now there are springing up in various leading thoroughfares claret-coloured stations for one of the underground electrical railways in course of construction. The magnificent Birkbeck Bank—unfortunately hidden in a side street—set the fashion for glazed tile architecture, and if this model, which is a beautiful structure with a higher standard of artistic taste, had been followed all would have been well. But many of our tiled buildings are outrageously gaudy. Though this cannot be said of the new claret-coloured railway stations, these edifices are far from picturesque and quite out of harmony with their surroundings."

VILLAGE ARCHITECTURE IN FINISTERE.

THE bleak countryside north of the town of Morlaix recalls in its natural features, in its history and in its people the "Old Cornwall" across the Channel which has been so lovingly described by John D. Sedding in one of his essays on art and handicraft. In both provinces are the same granite rocks, the same bleak and romantic landscape, the same austere and uncouth art, the same mingled tradition of Christian faith and heathen superstition. The names of Cornish villages and Cornish saints are to be found in Brittany; the Cornishman and the Breton are of the same race and temper; they follow similar callings, and till recently spoke similar dialects. It is useless to look for architecture of the more elaborate kind in a country which can never have been wealthy, where the staple material is granite, and where it is a difficult matter to build snugly and tightly against the keen weather. Even in the cathedrals of Brittany there are no daring feats of construction nor wealth of delicate ornament such as may be found in France, Germany or England. Yet, though Breton buildings are often small and unpretentious, and always sternly practical, there is in some of them that air of distinction which belongs to all work that is a little more solid, a little more ornamental, a little more lofty or spacious than bare necessity demands—a quality depending in a very small degree upon the actual size or cost of a building, for it exists even in some of the homely churches of Cornwall; in one it is due to the scantlings of the masonry, in another perhaps to the restrained and severe outlines of the exterior, and in a third to the wealth of carved woodwork within.

The Breton church is built somewhat upon English lines; apsidal ends are rare, even the cathedral at Dol having a square east end with a large traceried window. At Dol, too, many of the abaci are circular and

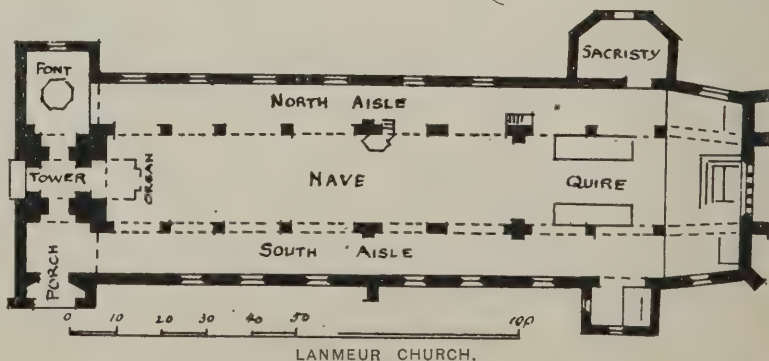

carved with English-looking stiff-leaved foliage; the nave piers have detached shafts, and the general feeling of the interior, with its strongly marked tower arches at the crossing, is decidedly English, except in the matter of relative height, its proportions being loftier than those of the average English thirteenth-century cathedral. Besides possessing the English feature of the square east end with its large window, the Breton churches, like those of our own West Country, are often built without chancel arches, though they are ordinarily roofed with lean-to aisles instead of in three nearly equal parallel spans in the Cornish manner. Consequently the aisles are narrower in proportion to the naves than they are in Cornwall, and the roofs as a rule are a good deal loftier and more prominent.

There are two good-sized churches in the town of Lanmeur—the larger a simple aisled oblong with a Romanesque crypt and a western steeple. It is an absolutely plain piece of engineering, with unmoulded round arches, square piers, and a timber roof. The arches are of varying spans and height, the side windows plain round-headed openings, and the east window elliptical-headed and filled with poor tracery. There is some primitive carving in the crypt, which is absolutely dark, and a little interesting detail in the screens and fittings of the baptistery and in the pretty organ in its equally charming loft at the west end. In spite of the bald-

ORGAN LOFT.

ness and utilitarianism of its architecture, and in spite, too, of modern improvements, this interior is dignified and church-like, for its builder, not having had the means to build ornamentally or massively, has wisely refrained from attempting to hide his poverty under a transparent cloak of shoddy ornament-

CHURCH OF NOTRE DAME DE KERNITRONN, LANMEUR.

ation. Outside, there is something fine about the seventeenth-century steeple and the bold outlines of the church, and there is a large plain Romanesque doorway in the south porch. But this, which appears now to be regarded as the principal of the Lanmeur churches, is less interesting and less instructive than the fine late Romanesque cruciform building known as Nôtre Dame de Kernitronn, which stands a little outside the village on its west side.

Built apparently at the close of the twelfth century, this church has the peculiar charm belonging to most transitional work, that very human quality of an ideal only partially realized which one so often misses in the more perfected styles. And if the larger church at Lanmeur shows how men may build cheaply and yet inoffensively, Nôtre Dame de Kernitronn is an equally valuable lesson in the far more difficult and nobler art of building with restraint and dignity and yet at the same time ornamentally.

Of the original building, the nave, transepts and central tower remain much as their designer left them, the chancel and the western bay of the nave having been rebuilt sometime in the thirteenth or fourteenth century. A good deal of the dignity of the building is no doubt due to the severe simplicity of the planning; for though the church is by no means a large one, the entire internal length being even now only 120 ft. in spite of its enlargement, the absence of aisles and the unbroken height of the walls give both the interior and the exterior a monumental character, stamping the building as something important and out of the common.

There are two great Romanesque doorways outside—one on the south side of the nave, the other at the end of the south transept. The outside of the nave has tall flat buttresses, measuring 1 ft. gins. by 6 ins., spaced on the average 8 ft. centre to centre, and corresponding to these, inside the nave, are tall slender shafts with foliated caps carried up to the tie-beams. The nave has plain tie-beams and a wooden barrel ceiling; but the transepts are vaulted in stone with heavy pointed barrel-vaults and large square ribs carried on shafts like those in the nave.

The crossing is groined with ponderous moulded ribs quaintly finished with scroll ends around the belfry hoist, and the four heavy pointed tower arches spring from great circular piers 6 ft. in diameter, with small attached shafts. The tower itself is carried up quite plainly, with two small belfry lights on each face, and is fittingly crowned by a low slated spire. Although there is no sculpture in the church except some time-worn figurework in the doorways and unimportant carving in the capitals, the building is unmistakably an ornamental as opposed to a merely utilitarian one. Like Durham or Waltham, it proves that the art of building is of itself sufficient to create a beautiful object without the added graces of painting or sculpture. Undoubtedly the union of all the arts, when duly ordered, must always produce a nobler result than can be obtained from the resources of the building art alone;

still, work like this at Lanmeur shows that, when circumstances prevent, as they sometimes must prevent, a builder from working in co-operation with good painters and sculptors (and all but the good ones are anathema) he need not necessarily, in despair of attaining the beautiful, content himself with aiming at the merely "pretty" or the "picturesque."

The later portions of Nôtre Dame are good of their kind, though they miss the vigour and earnestness of the early work. These additions have the great merit of clearly showing their date, being built in granite ashlar, while the older parts of the church are in rubble. The whole, too, groups well together and has a beautiful setting of fine trees. In the churchyard is a stone crucifix of about the same date as the chancel, and the churchyard gateway is cleverly arranged with curved walls and big stone piers with balls on the top. North of the church is a cemetery with an excellent modern crucifix, the graves in this cemetery being unusually arranged, at right angles to the axis of the church. It must, unfortunately, be added that the whole interior of the church has been restored and painted with "oil cloth" patterns executed in crude colours, and that all the old fittings of interest have been swept away.

Lanmeur is a dull and rather prosaic-looking country town, to which no greater contrast could well be imagined than the romantic village of St. Jean du Doigt, about three miles away, planted at the bottom of a little valley sloping down to the seashore. St. Jean du Doigt is a place of no small importance, since its church contains a finger of the Baptist, which finger has caused healing

STONE CRUCIFIX IN CHURCHYARD.

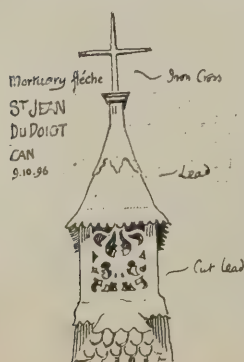

springs to flow from the hills above the village, whose waters are potent to restore the blind their sight, and which certainly make the valley an oasis in the waste of bleak uplands that lies between Morlaix and the sea.

At the annual "pardon" the village is crowded with pilgrims from all the countryside, and during the bathing season it is alive with French "trippers," but at other times it is a quiet sleepy place with an atmosphere of faded greatness in its big church and its sturdy old houses. At the parting of two roads on the hillside north of the village is the source of one of the miraculous iron springs which have been mentioned. This is enclosed with low stone walls having stone seats and a niche over the head of the spring; close to it stands a tall wayside crucifix rudely carved with a figure of Our Saviour on one side and a standing figure on the other. It is altogether a

charmingly treated fountain of the simpler sort, and the stonework looks about 250 years old. A far finer and more elaborate fountain stands in the churchyard. This consists of a very large simple stone basin with a smaller one rising out of it; above is a delicate piece of leadwork with figures of the Almighty, the baptism in Jordan, and the donor, the last named in knee-breeches and long-skirted coat. The whole is Renaissance in character, but of more delicate workmanship and more refined proportion than most work of its date in the neighbourhood. The natures of the various materials used have been thoroughly appreciated by the artist who made this fountain; the stonework is broadly and simply treated, forming an excellent foil to the dainty metalwork above, while the sparkling jets of water are so arranged as to contribute in no small degree to the general effect.

Beside the fountain is the large stone gateway of the churchyard. Its main arch has a rich crocketed canopy with climbing beasts carved on its flanking pinnacles, and above are two niches of slightly different designs, the simpler one containing a weather-beaten stone bishop, the more elaborate a delicately-carved figure in oak, possibly representing the builder of the gateway or some benefactor of the church. Close to the south porch of the church itself stands an open-sided seventeenth-century chapel with an enormously high slated roof finished with an open-work lead turret. Such mortuary chapels are not uncommon in the neighbourhood, and this at St. Jean du Doigt is a characteristic specimen. Its sides have square balusters of granite standing on a moulded and fluted granite plinth; the roof, resting upon granite lintels, is framed in the old Gothic manner with curved braces and moulded purlins with bosses at the inter-sections; it is ceiled to the

line of the curved braces, and at the east end is formed into an apse which contains a small stone altar below an open oval window.

The church which forms the dominant feature of this extraordinary group of buildings is comparatively of small size, being only 110ft. by 44ft. inside. It is built on the simplest possible plan, a mere aisled oblong with a tower at one corner and a porch and a transept on the south side. Yet inside and out the building strikes one as both novel and unusual. There is even a sense of experiment and amateurishness about some parts of the church; it is conspicuously and even aggressively bold and pictorial, the very antipodes of our own great sober parish churches in England with their homely square towers and their business-like aisles and clearstories. Though it covers so small a space of ground, the building, owing to its great height and striking treatment, is unmistakably something more than an ordinary parish church; like the "Sainte Chapelle," it is a great reliquary, and whereas generally the country church has grown up with the growth of the village and has been enlarged and adapted over and over again to meet the growing wants of the villagers, here it would seem, that the village has grown up around the church. The building has a large south porch with a high-moulded entrance arch, a groined ceiling and a double inner doorway on the central pillar of which is a carved niche with triptych-like glass shutters enclosing an old painted statue. East of the porch is a small transeptal chapel, and between the porch and the tower the eaves of the aisle are finished over an open-traceried overhanging gallery which, but for its detail, would not look out of place in Padua. The tower is of characteristic design. Built with very deep angle buttresses, its sides are plain up to the belfry level except for a series of traceried "triforia" corresponding with the eaves gallery of the aisle. The belfry has long coupled lancets on each face; above these there is a pierced parapet within which rise the spire and its four pinnacles, all of wood covered with lead. Between the buttresses at the base of the tower are two lean-to charnel-houses, that on the south being of mediæval and that on the west side of seventeenth-century character. The aisles of the church are of considerable height, and a sharply-pitched slated roof covers the whole building in one great span. The west front is treated in a skilful manner so as to convey an impression of great height, and the tall four-light west window is filled with graceful flamboyant tracery under a round arch. The west doorway is comparatively simple and unimportant, but it retains its original doors with effectively arranged panelling. The east window is filled

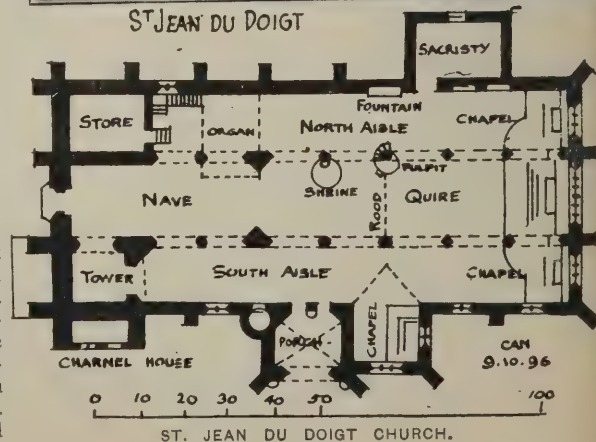

with unsatisfactory geometric tracery of late date, and there is but a single window in the north aisle.

The internal arcades are unusually tall, some of the pillars being plain octagons, others regular Perpendicular clusters like those in New College ante-chapel. Half-way down the nave there is a large clustered respond on each side; these look as if they had been built to carry a transverse arch across the nave.

One cannot but admire the strangeness

ST JEAN DU DOIGT

ST. JEAN DU DOIGT CHURCH.

and stateliness of such an interior, sinning as it does against the received canons of architectural proportion. We moderns, who build perforce like pigmies, may well envy the creator of such a church, unfettered by the fads of committees or the cast-iron regulations of Incorporated Societies and Ecclesiastical Commissions. The church of St. Jean du Doigt compels worship; its stones preach an enduring testimony to the Faith—and who shall dare to say that such a building fulfils the purpose of a church less efficiently than the most “handsome” and “convenient edifice” where the Chinese puzzle of providing an impossible number of seats within sight and sound of altar and pulpit has been most nearly solved, and where necessary makeshifts have been most successfully disguised beneath the lion’s skin of mediævalism. The building too is fortunate in having been spared the agonies of a French “restoration,” and though in a rather mouldering and decayed condition, it still contains a good deal of old furniture. The baptistery under the tower is screened with charming mediæval parcloles consisting of plain diagonal balusters between moulded rails, all coloured and gilt. On one of the nave piers is a trophy of banners, under which stands an old painted and gilt image of St. John in a kind of shrine enclosed with a circular balustrade of seventeenth-century work, the top rail of which is cunningly contrived as a money-box for the sous of the faithful. Perched up in an odd little gallery in the north aisle is a small Renaissance organ case with a large painting in front of King David and St. Cecilia and a heavenly choir, not perhaps a very fine work of art but pleasing enough in its faded bravery of colour and simple and telling in its drawing and arrangement. The altars have great rococo marble and stucco reredoses with clumsy Corinthian columns and ponderous imagery, ugly in themselves yet possessing a certain dignity and largeness of treatment which, now that time and dirt have softened the details, would make one sorry to see them altered. At the chancel entrance is a

ST. JEAN DU DOIGT CHURCH.

plain Renaissance rood beam, with painted images and pretty scrollwork at the base of the rood. There is a trough in the north aisle filled with running water from the miraculous spring, and the sacristy contains good store of gold and silver treasures.

The church roofs are well-preserved specimens of a type common in the district. The nave has a pointed-arched wooden barrel-ceiling with moulded ribs close together and a single ridge rib with carved bosses, and plainly chamfered tie-beams, the wall-ends of which are carved with dragons’ heads holding the beams in their teeth. The lean-to aisles have half-arched ceilings corresponding to that of the nave. All the boarding is painted blue and powdered with white stars; the dragons are fiercely green, with vermilion lips and very white teeth; and the tie-beams, wall-plates and ribs are painted in a variety of chequer patterns in dark red and white. The wall-plates in the

aisles have carved angels and beasts, standing out hammer-beam fashion, and in the south chapel is a delightful carved cornice of vine leaves and grapes, looking as if it had come out of some Cornish or Devon workshop.

Beside the churchyard gateway is a large old building, formerly a pilgrims’ hostel,

ORGAN CASE.

Hostel St. Jean du Doigt

THE STABLE.

The Hostel
ST. JEAN DU DOIGT.
CAN 22996

ENTRANCE TO FARMYARD.

which is said, like most of the later Gothic work in the neighbourhood, to have been built by Anne of Brittany. Whatever may have been its origin, its stately outlines and carefully-built masonry are sufficient proof that it was designed to serve no mean purpose. The main doorway has flanking pinnacles and a crocketed canopy in granite, and there is a delicate cornice of running foliage forming a corbelling on one side. The windows have ashlar quoins, and the whole treatment is distinctly large and important. The eastern wing of this building appears to be an addition, and at the west end of it, near the churchyard gate, is a detached chapel-like "annexe," now used as a stable. The

hotel opposite to this has remains of mediæval work in its doorway, though the rest has been modernized; in a granite country like that round Morlaix people seem to think twice before they pull down their houses, and it is therefore likely that many buildings in the district are substantially of mediæval date, though some of them have been altered beyond recognition. Perhaps it may be owing to the character of the staple building material that men still build there in somewhat of the old manner, and that a small spark of the old building tradition has been kept alive to the present day.

Just outside the village, on the side of the narrow lane that leads to Plougasnou, is a complete late Gothic farmstead, the house retaining its original doors and windows, the farmyard forming a quadrangle in front entered by a splendid double archway. The group forms a charming picture with its backing of tall trees and its sturdy weather-worn granite masonry, which looks as if it would last for ever. Beyond these farm buildings the lane becomes a steep narrow pathway leading on to the plateau surrounding the valley of St. Jean. At the top of the hill is another small farmstead with a huge wooden cross painted red, and just beyond it a curious little open-sided oratory, dated 1611, built with caryatid pilasters on two sides and roofed with a pointed arch of granite having large granite tie-beams. Over its small stone altar are brackets bearing images, that of the Madonna being apparently original. The corresponding figure was brought from Plougasnou Church. The village of Plougasnou lies just beyond the oratory, about a mile and a half away from that of St. Jean du Doigt. The houses here are mostly of the seventeenth and eighteenth centuries, very simple and restrained. Some of the outlying ones are more ambitious, with quaintly-treated porches and covered wells in their gardens.

C. A. N.

(To be concluded.)

ORATORY AT PLOUGASNOU.

(Material: Dressed granite: joints flush, averaging $\frac{1}{2}$ in. to $\frac{3}{4}$ in. wide. The floor is roughly paved. There are no caryatides on the north side, but plain pilasters similar to the outer ones on the south side. Dated 1611. There are remains of crosses on the east and south sides, a short distance from the Oratory.)

Keystones.

A Stained-glass East Window has been placed in Heydon Parish Church.

A new Lighthouse is to be erected on Brothers Island, in the Red Sea, to replace the present structure.

Three new Bridges are to be constructed over the Ibrahimieh Canal at Manfalout, Beni Kora and Nazali Saoub at a cost of about £25,000.

Housing Schemes now in course of progress by the London County Council will displace 4,794 persons, provide accommodation for 5,064, and cost altogether an estimated sum of £524,000.

A Carnegie Library at Wombell is being erected. The architect is Mr. H. L. Paterson, of Sheffield, whose design was chosen from among nine competitors. The contractor is Mr. William Johnson, and the building is to cost £3,100.

A Roman Catholic Presbytery at Brentford, of ten rooms, has been erected. The priest-in-charge drew up the plans, did the surveying, acted as clerk of works, and laid out the gardens. The chief portion of the labour was done by male members of the congregation.

The new Bridge over the Wear at Sunderland is to be a "two-deck" structure, and will cost the North-Eastern Railway Co. £300,000. When the new high-level bridge over the Tyne and that over the Wear are complete the railway system from the Tyne to the Wear will permit of much better working than is possible at present.

The Church Army's new Headquarters has been completed. The building has two frontages—one in Edgware Road and the other in Bryanston Street, W. The latter frontage is built of pressed red bricks, with stone dressings, to harmonize with the Men's and Women's Training Homes adjoining. The roof is flat and railed in. The total cost has been £40,000.

Darvel Town Hall has been completed at a cost of £5,000. The façade of the building has been carried out in stone, designed in a free Italian Renaissance style. The main hall has a frontage of 55ft. and a depth of 160ft. There are also provided a council-chamber and lesser hall. The contractors were Messrs. Robert Mair & Sons, of Darvel, the architect being Mr. T. H. Smith, of Basinghall Street, London.

A large Turret Clock at Warley Church, Halifax, has been completed by Messrs. W. Potts & Sons, of Guildford Street, London, from the designs and plans of the late Lord Grimthorpe. The same firm are also making a large illuminated Cambridge quarter-chime clock and a set of bells for the Carnegie Free Library, Clitheroe. They are also constructing a clock, chimes and bells for St. Patrick's Cathedral, Dundalk, Ireland.

The new Nurses' Home in Fulham Palace has been completed. On the entrance floor, which is in mosaic work with tiled dado, are the assistant matron's room, sisters' and nurses' sitting-rooms, library, spare room and six bedrooms. The first and second floors consist of bedrooms and offices, painted in pale green or salmon tint. The basement contains the usual offices. The hot-water apparatus has been installed by Messrs. J. & F. May, of Whetstone Park; the electrical appliances, wires, &c., by Messrs. Cash & Co., of Westminster; and the electrical fittings by Messrs. Sotheby & Co. The terrazzo floors and tilework have been executed by Messrs. Simpson & Co., while Messrs. Doulton & Co., of Lambeth, were responsible for the sanitary fittings. The architect was Mr. A. Saxon Snell, of Southampton Buildings, London, W.C., and Messrs. Cowley & Drake, of Willesden Green, were the builders.

A Gordon Highlanders' Memorial has been erected on the Castle Esplanade, Edinburgh.

The Restoration of Wymondham Parish Church, begun in 1901, has been completed. The total sum expended has amounted to £19,935.

The County Fire Office and Provident Life Co. have opened new offices at Glasgow. The building, which is free Classic in style, was designed by Mr. R. A. Bryden.

A.A. Students' Designs.—The designs of students at the Architectural Association School of Design, together with the prize drawings, are on exhibition this week at 18, Tufton Street, Westminster, from 10 to 7.

Admiralty Works at Whale Island.—We understand Messrs. Patman & Fotheringham, Ltd. (James F. Parker, managing director), of Theobald's Road, W.C., and Park Street, Islington, N., are making excellent progress with the officers' quarters, &c., at Whale Island, Portsmouth, for the Admiralty.

Arts and Crafts Exhibition.—The ninth annual exhibition of work executed during the past session by students of the London County Council Central School of Arts and Crafts will be held at 316, Regent Street, W., on Thursday, Friday and Saturday, July 13th, 14th and 15th, from 10 till 8 each day. Admission is free on signing the visitors' book. The work on view comprises artistic work in bookbinding, stained-glass, gold and silversmiths' work, metal casting, enamelling, die-sinking, engraving, cabinet work, carving and gilding, embroidery, writing and illumination, lithography and woodcuts, architectural design, furniture design, drawing, modelling, and design for various processes. There will also be shown a selection of drawings by pupils of secondary schools aided and inspected by the Council.

The Manchester Society of Architects visited on July 1st two recently-built houses at Knutsford, "Bexton Croft," for Mr. D. Macpherson (Mr. M. H. Baillie Scott, architect), is a simply designed house, built with a keen sense of the value of the picturesque. "Woodgarth," for Mr. George Wragge (Messrs. Thomas & Percy Worthington, architects), has great architectural charm, and was illustrated in our issue for March 8th last. Afterwards some sketches were made of Bexton Hall, a simple old red-brick farmhouse, with a certain stateliness in its symmetrical front crowned by a large octagonal lantern, and approached through an enclosed forecourt. The Society has also made an evening visit to Oldham to see additions to two houses for Mr. William and Mr. James Dronsfield (Mr. J. Henry Sellers, architect).

Reform of Local By-laws.—Several architects (including Mr. Christopher Turner, of Wragby, Lincs., and Mr. Thackeray Turner, secretary of the Society for the Protection of Ancient Building) recently gave evidence before the Select Committee of the House of Lords on the Public Health Acts (Amendment) Bill to the effect that the restrictive nature of the existing building by-laws seriously interfered with landowners who desired to assist those working on the land to better houses, especially where economy was an object. The scarcity of buildings in which to house agricultural labourers properly was one of the great causes of rural depopulation. Many more people would be on the land if they had better houses. One witness put the excess of cost of building by reason of the by-laws at 20 per cent. Moreover, the bother involved was such that landowners in many cases would not build at all until the by-laws were modified. Complaint was also made that certain local authorities, instead of helping, hampered and even stopped altogether every attempt on the part of landowners and others interested in rural housing.

The Birmingham Dental Hospital, in Great Charles Street, was opened last week by Sir Oliver Lodge. Messrs. Bateman & Bateman were the architects.

Mr. J. D. Sutcliffe's Paper on "The Practice of Ventilation," which has already appeared in our columns, has been issued in pamphlet form with a number of additional illustrations by the Sutcliffe Ventilating and Drying Co., Ltd., of Cathedral Corner, Fennel Street, Manchester.

Cobham Cottage Hospital has been erected at a cost of £1,250. The building is cream rough-cased, with red-tiled roof and green painted exterior iron and woodwork. The designs were prepared by the late Mr. F. W. Bedford, F.R.I.B.A., and carried out by Mr. George Kyle, of Ripley and Cobham.

Competitions.

A Cottage Hospital Competition.—Architects will be asked to compete for the new cottage hospital to be given to Port Glasgow by Mr. and Mrs. John Birkmyre. A suitable site has been obtained from Sir Hugh Shaw Stewart of an acre and three-quarters. Twenty-two beds are desired. The sum set apart for the construction work is £10,000.

Wincobank Housing Scheme, Sheffield.—The Housing Sub-committee of the Sheffield Corporation recommend the adoption of the plan of Mr. H. L. Paterson, the successful competitor in the recent competition for twenty houses at High Wincobank, and the adoption of the tender of Mr. Nathouse, builder, for the erection of the houses at a cost of £2,520. The competition, it will be remembered, was for the erection of houses to be let at 5s. per week clear, without any charge on the rates. Mr. E. M. E. Gibbs was the assessor in the competition.

Branch Libraries at Cardiff.—Mr. H. V. Lanchester, the assessor in the competition for branch libraries at Canton and Cathays, Cardiff, towards which Mr. Carnegie has given £10,000, has made his award as follows:—Cathays library—first (£75), Allen, Speir & Beavan, Cardiff; second (£50), E. M. Bruce Vaughan, Cardiff. Canton library—first (£75), E. M. Bruce Vaughan; second (£50), J. Allen, Speir & Beavan. The buildings are not to cost more than £4,750 each, the balance of £250 being required for fittings. Twenty designs for each library were submitted.

New Mitchell Library, Glasgow.—Seventy-six sets of designs have been submitted in competition for the new Mitchell Library buildings to be erected in North Street, Glasgow. Forty-two were first selected for thorough examination, and then a short list of seven, which were submitted to the measurer. The assessors, Mr. John Keppie, F.R.I.B.A., and Mr. A. B. MacDonald, City engineer, have awarded the first place to design numbered 32, cost £44,479; the second to design numbered 47, cost £41,900; the third to design numbered 21, cost £42,994; and the fourth to design numbered 55, cost £48,425. In their opinion the architectural merit (especially with regard to the North Street front) of No. 47 is greater than that of No. 32, but in plan No. 32 is superior to No. 47. The design of Mr. William B. Whitie, of Glasgow, has been selected.

Obituary.

Mr. John Boldero, master-builder, of 149, Seven Sisters Road, London, died suddenly recently, aged 41.

Mr. William Kerr, architect, of Ayr, died recently after a short illness. He was engaged in the erection of an addition to the Kyle Union Poorhouse at a cost of £12,000.

THE TIMBER TRADE.

The London Market in June.

NO improvement can be recorded in the London trade for the month of June, and the deliveries from landed stock have fallen off again by something over 2,000 standards, but this is to some extent compensated by a better delivery over side. Messrs. Churchill & Sim state that the trade has been very retail and unprofitable as a whole, except for the smaller-sized battens and floorings, of which the stock is not excessive. The White Sea shippers again made reductions in their prices in order to effect wholesale business; but this has not been followed by any concessions from the Swedish side, where shippers are still inclined to hold for full prices. The month closes with a slightly improved enquiry here and there in the country generally, London excepted, and a prospect of a plentiful supply of tonnage at considerably less than what are known as "conference" rates.

The volume of business during June suffered by the Whitsun holidays (Messrs. Denny, Mott & Dickson, Ltd., state) and the general tone was dull. The half-year as a whole has, however, developed a steady confidence in the soundness of the position all round, and a well-founded belief that the general business of the country is expanding and that the timber trade industry will surely, if slowly, benefit thereby.

The abstract of dock stock, consumption, &c., for June, published by Messrs. Foy, Morgan & Co., is given in the table at the foot of this page.

Dock Stock.

The stock of wood in the public docks on June 30th was—

	Pieces.
Foreign deals and ends - - -	990,000
Do. battens - - -	1,681,000
Pine deals and battens - - -	896,000
Spruce do. do. - - -	640,000
Boards, rough - - -	2,903,000
Do. prepared - - -	5,902,000

Totalling 13,012,000 pieces, as compared with 15,437,000 in 1904, 15,657,000 in 1903, and 18,084,000 in 1902.

In other kinds the stock was as follows:—

Foreign wainscot logs - - -	95 pieces.
Do. oak timber - - -	526 loads.
Do. fir timber - - -	203 do.
Do. Oregon pine, &c., spars and masts - - -	4,015 do.
Colonial oak timber - - -	1,276 loads.
Do. birch timber and planks - - -	1,788 do.
Do. elm and ash timber - - -	503 do.
Do. yellow pine - - -	246 do.
Do. red pine - - -	177 do.
United States pitch-pine timber - - -	15,500 do.
Do. do. deals - - -	44,000 pieces.
East India teak - - -	7,932 loads.

The deliveries for the first six months have been of—

	Pieces.
Foreign deals and ends - - -	1,589,000
Do. battens - - -	2,981,000
Pine deals and battens - - -	553,000
Spruce do. do. - - -	781,000
Boards, rough - - -	2,817,000
Do. prepared - - -	7,682,000

Totalling 16,459,000 pieces, as compared with 18,200,000 in 1904, 19,109,000 in 1903, and 19,977,000 in 1902.

The deliveries for June

were as follows:—

	Pieces.
Foreign deals and ends - - -	198,000
Do. battens - - -	371,000
Pine deals and battens - - -	75,000
Spruce do do - - -	94,000
Boards, rough - - -	283,000
Do. prepared - - -	1,140,000

Totalling 2,161,000 pieces, as compared with 2,616,000 in 1904, 2,510,000 in 1903, and 2,688,000 in 1902.

Deliveries from Ship to Craft.

The deliveries direct from ship to craft for the first six months of the year have been:—

	1905. P.s.h.	1904. P.s.h.	1903. P.s.h.	1902. P.s.h.
Deals and battens	33,627	33,165	34,038	30,870
Boards - - -	9,739	7,356	11,737	11,452
Total - - -	43,366	40,521	46,675	42,322

and for June—

	P.s.h.	P.s.h.	P.s.h.	P.s.h.
Deals and battens	17,589	17,679	13,412	16,766
Boards - - -	3,754	2,524	4,470	4,676
Total - - -	21,343	20,203	17,882	21,442

Soft Woods.

Sweden.—Messrs. Churchill & Sim state that the importation of deals and floorings has been a normal one, but only about half the usual quantity of battens has come forward. Prepared boards have sold well, the demand for them seems to have recovered somewhat, and the stock remains very light. Swedish deals are scarcely fetching the lowest cost prices of the season after freight and charges have been provided for. The utter lack of demand for the larger sizes is responsible for this unsatisfactory state of things.

Norway.—Norway has sent forward more scantlings and battens and fewer floorings than usual in June. The import for the six months has, however, been practically the same as last year. Flooring prices are inclined to harden on a better market caused both by a stronger demand and a present reduction in the stock.

Russia.—There is a want of confidence as regards the stability of prices of White Sea deals which has tended to make operators very nervous and disinclined to enter into fresh purchases. Prices on the other side were reduced during the month, and are probably by now fairly low enough intrinsically, but the lack of demand in this market has strengthened buyers in their resolve to refrain from adding to their costly stocks, even at the tempting reductions now offered to them. A small importation may be the result and, unless the demand improves, probably the best for the market.

Finland.—With only a normal importation prices have kept quite steady during the month, and in the smaller-sized battens even a slight improvement may here and there be noticed.

Prussia.—There is hardly any trade for fir timber in the docks, and the importation for special works has lately been even smaller than usual. Oak is in poor demand, but prices are quite firm.

Canada.—There is no improvement to be noticed in the prices obtainable for pine deals, and in spite of practically no importation during June the stock remains ample for the poor demand for them. Unless there is more enquiry during the next few weeks the outlook for the season is not promising for those producers on the other side who have not yet quitted their stocks. The shipments of spruce have been below the average so far, but quite enough to meet the reduced demand, and sales have been hampered by some cheaper quotations from the Lower Ports. These quotations are not yet suffi-

ciently tempting for London buyers, and the market is consequently rather at a standstill. The demand for all timber has been poor. Only one cargo of sawn timber has arrived during June to freshen up the stock, which, considering the demand, is really ample. There is no appearance of lower values on the other side; rather the contrary, for the demand from markets other than European continues unabated. A few more deals have arrived during the month and have met with a good enquiry.

Mahogany.—Business in this market continues to fall away, both imports and deliveries into consumption being on a small scale. The imports continue to be so light as to stiffen prices, notwithstanding the small consumption; but the shrinkage in the volume of the mahogany trade in London is increasingly apparent and disadvantageous to both merchant and dealer.

Odessa Oak.—The recent imports of this wood have been of a very standard of quality, and have found a ready market. The position of this wood with consumers is the more assured as it continues to be tested, and the enquiry for it continues to widen out at a rate which promises to exceed the supply.

TESTING A REINFORCED CONCRETE FACTORY.

A FERRO-CONCRETE linen factory has been erected for Messrs. Thomas Somerset & Co. in Hardcastle Street, off the Dublin Road, Belfast. The factory is 180ft. long by 50ft. wide. The architect was Mr. W. J. W. Roome, M.R.I.A.I. and he prepared plans on the basis of a light structure five storeys high. Having regard to the delicate nature of the fabrics made, it was essential that the new factory should be as nearly as possible free from dust, and that the ill-effects of machinery vibration should be absent. After careful consideration the Hennebique system of ferro-concrete was adopted for the floors. The erection of the building was entrusted to Messrs. J. & R. Thompson, contractors, of Belfast. Tests were carried out in order to meet the requirements of the city surveyor, Mr. H. A. Cutler. All the floors of one bay were loaded with about 75 tons of granite setts in order to test the pillars, giving a stress of about 2½ cwt. per ft. super., and as a result it was found that there was absolutely no subsidence. A second test dealt with the concrete beams carrying the floors, the area borne by each being loaded with 27 tons. After examination with scientific instruments it was found that the deflection on the 24ft. girder was $\frac{1}{2280}$ th of the span, the guaranteed deflection being $\frac{1}{6000}$ th part of the span. Mr. L. G. Mouchel was the engineer, the work being executed by the Yorkshire Hennebique Contracting Co., Ltd., under the supervision of Mr. David Jones, managing director. The quality of the concrete is of great importance in ferro-concrete structures, and the materials used in this instance were Ballycastle gravel and Portland cement, supplied by Messrs. W. & D. Henderson & Sons, Ltd., of Belfast, the special brand being manufactured by Messrs. J. B. White Brothers, of London.

FOUNDATIONS.*

By L. L. BUCK, M.Am.S.C.E.

IN studying foundations for heavy concentrated loads the writer has observed the effects of such loads upon existing structures. In such cases, where defects soon appeared, one could easily trace their causes. Where such defects arise from the use of poor stone or mortar they are not worth considering, but there are many cases where such defects appear in which both stone and mortar seem to be excellent. In such it is evident that the question of distribution must be examined.

Sometimes a heavy and heavily-loaded stanchion is found resting on a foot-box made up of plates riveted to the bottom of the stanchion with angles riveted to the lower edges of these plates, and then a horizontal plate having an area of seven or eight times the area of the cross-section of the stanchion, and supposed to distribute the pressure over the area covered by the plate. This is an extreme case, and does not occur as often of late years as it did earlier; but there have been cases within a few years where a heavily-loaded stanchion rested on a casting so shallow that it could not nearly distribute its load over the whole area of the base of the casting.

The writer has in mind one case in which a heavy stanchion rested on a casting, and the casting rested on a large nest of rollers. The outer ends of all the rollers and the outer rollers at each end of the bed were not borne upon at all. It is not easy to distribute enormous concentration of weight over a

FIG. 1.

FIG. 2.

sufficiently large area to give the proper unit pressure over the whole area; but this should be done, and it requires greater height in proportion to the base of the bed than is in many cases given.

Having properly proportioned the foot of the stanchion, attention must next be given to the masonry pedestal on which it is to rest. Supposing the bed-plate distributes practically its whole load over its entire area equally, the question will arise as to how far outside of the bed-plate the stone of the pedestal can project (not only advantageously but with safety) in the top course, below the coping, and how far it can go without absolute detriment to the work. If it is extended more than about zins. per ft. of thickness of the course, no perceptible advantage will be gained. Of course, it must project sufficiently to keep the pressure per square foot within proper limits, including the weight of the masonry and the wind-pressure, and if it is to rest on concrete to keep the pressure on the concrete within proper limits.

The difficulty of trying to extend the masonry too far beyond the bed-plate is that the stone may crack, and if so, it will start under the edge of the bed-plate, and the crack may incline still further under the bed-plate at the bottom of the course. Moreover, with too large a mass of masonry there is a tendency to put the best masonry outside and a poorer quality within. In this case the poorest masonry sustains the load. This is similar to making the pedestal of a bag filled with sand. In this case the bag will

be pretty sure to burst, whether made of cloth or masonry.

Fig. 1 represents two courses made of cut stone, with $\frac{1}{2}$ in. joints. This form secures excellent bonds, and from it the writer has obtained excellent results.

Where four or more heavily laden stanchions rest on one foundation the writer thinks it is best to have the centre of pressure on each stanchion so nearly placed that the distance between each pair of stanchions each way shall be about equal to the sum of the distances of the extension of the masonry outside of the stanchions, and then to build the pier in such a manner that there shall be a pedestal of first-class masonry under each stanchion similar to that of the single-stanchion foundation. But the pedestals must be bonded to whatever masonry is outside or between these pedestals.

In some cases, where the load on one stanchion is very great, a casting, in order to distribute its load properly over the whole area of its base, must either be as high as the length of the base or the casting must be in several pieces bolted together for convenience in handling. In this case the bottom length of the stanchion can be given such a taper that its lower end will cover a space equal to half the area of the base of the casting, when the casting will require only about half the height required in the other case. Of course, the casting, in both cases, must be thoroughly ribbed. There are other ways of accomplishing this result, but it is doubtful if on the score of economy they are any better.

In the case of heavy walls having frequent window openings one will sometimes find

them showing disagreeable cracks similar to those indicated in Fig. 2.

This trouble might have been avoided by a form of construction similar to the right-hand portion of the diagram. Construct the area of b so that the area of its base in proportion to that of a shall be equal to that of the weights they respectively sustain.

The whole idea is to use the pedestal form, and not to project the stones under the heavily loaded portions more than the transverse strength of the stone will safely sustain.

OUR PLATE.

HAILEY HALL was built on the site of the old house near Broxbourne by Messrs. Ekins, of Hertford, to the designs of Mr. William Hunt, of Donington House, Norfolk Street, Strand. The brickwork is a dark cherry red; the timberwork is in oak. The roof is covered with deep-red rough tiles. Internally the principal rooms are simply panelled in oak and all other internal woodwork is in oak. There is an artesian well from which a good supply of water is pumped by horse-power.

The cottage at Great Missenden is proposed to be used as a week end or holiday home. The living-room has been made the principal room in the house, with a scullery to be used as a kitchen and also a small parlour or study adjoining four bedrooms provided above. The materials are to be: rough-cast walls, rough brown tiles for roof, oak window frames, iron casements and oak external doors, and the cost is desired not to exceed £450.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Buildings to Measure near Alton, Hampshire.

LONDON, N.W.—SUBSCRIBER writes: "Is there any place round Alton, Hampshire, that would be suitable to measure for the final, R.I.B.A.?"

Alton contains a good church of the Perpendicular period. Four miles south-east of Alton stands Selbourne, with an Early English church. Basingstoke, which is easily reached by rail from Alton, contains a Perpendicular church. The following places are also situated in direct railway communication with Alton:—Winchester; Compton and Soperton, each with a Decorated church; Exton and Hambledon, with Early English churches. H. M.

Buildings to Measure near Barrow.

DOUGLAS, I.M.—PROBATIONERS write: "We intend visiting Barrow, and would be obliged if you would tell us what suitable churches there are in the vicinity to measure for the intermediate R.I.B.A. examination."

There is nothing of architectural interest in the vicinity of Barrow save the remains of Furness Abbey, which will afford material for R.I.B.A. intermediate testimonies. There is work in this abbey of all periods from eleventh to fifteenth century. The entrance to the chapter-house or the abbot's chapel and porch, where the vaulting still remains, are perhaps most suitable for your purpose. Both these portions of the Abbey are in the Decorated style. The plan of the abbey, which is of the Cistercian order, should be noticed, as they can be easily traced out in this fine example. H. M.

City Churches.

LONDON, E.C.—STUDENT, R.I.B.A., writes: "Please name any buildings, and what portions, I could measure either in or near the City for the R.I.B.A. final, testimonies of study, measured Renaissance sheet."

If you prefer Gothic work, some portion of Westminster Abbey would be most suitable for your purpose. It is difficult, however, to obtain permission to measure in the Abbey. Application for sketching tickets should be made to the Dean of Westminster, or to the secretary of the Architectural Association if you are a member of that body. If your application is refused, the next building suitable for your purpose is the Temple Church, a very fine example of the style transitional between the Norman and Early English, on to which is built a fine thirteenth-century nave. St. Ethelreda, Ely Place, Holborn, of a style transitional between the Early English and Decorated; St. Olaves, Hart Street, immortalized by Dickens as St. Grimy Grim on account of the skull and crossbone ornamentation of the railings and gate-posts, and St. Mary's, Aldermanbury, built in 1510, burnt by the great fire and erected to the original design by Sir Christopher Wren, are also churches suitable for measuring as testimonies of study. The whole or portions of the following works will make most suitable testimonies of study of the Renaissance style:—St. Paul's Cathedral; St. Bride's, Fleet Street; St. Mary-le-Bow, Cheap-side; St. Stephen's, Walbrook; St. Michael's, Pater-

* A paper presented to the American Society of Civil Engineers.

noster Row; St. Andrew's, Holborn; St. Martin's, Ludgate; St. Benet's, Paul's Wharf, and many others of Wren's City churches. If a wider choice is required you should consult Godwin and Britton's "London Churches" at the library of the R.I.B.A. The above churches are in the City. Other buildings are St. James's, Piccadilly; St. Clement Danes; St. Mary-le-Strand; St. Martin's-in-the-Fields; St. Paul's, Covent Garden; Kensington Palace; the Dormitories, Westminster School; Greenwich and Chelsea Hospitals; the Banqueting Hall, Whitehall; Ashburnham House, Dean's Yard, Westminster; Somerset House; Horse Guards; House in Adelphi Terrace. If you go on a tour of inspection before deciding what to measure, you will most probably find some building surrounded by a scaffold, undergoing repairs, which you will find of considerable convenience when measuring.

H. M.

Buildings to Measure near Harrogate.

HARROGATE.—E. J. writes: "Kindly name any churches in the neighbourhood of Harrogate suitable for making measured drawings."

There is nothing worth measuring in the immediate neighbourhood of Harrogate. It would be your best plan to make a short stay at Ilkley (where there is an Early English church), at Ripon or at Fountains, when you could take all the necessary measurements on the spot and plot them on your return to Harrogate.

H. M.

Buildings to Measure near Ilfracombe.

MIDDLESEX.—E. T. writes: "Are there any buildings of architectural interest in the neighbourhood of Ilfracombe, in Devonshire, taking a 20-mile radius?"

There are no buildings worth measuring within 20 miles of Ilfracombe. All the fine buildings in Devonshire are to be found in the south and south-west of the county, many of which were mentioned in the "Enquiries Answered" column of last week's issue.

H. M.

Expansion of Concrete Floors.

LONDON.—C. W. writes: "The floors of a building are constructed of steel joists and Portland cement concrete composed of 1 part Portland cement and 5 parts furnace ashes which contain a proportion of iron clinkers and also some small pieces of unburnt coal.

Wherever these floors touch the walls the concrete has pushed out the walls, but in some cases it has been two months before any movement has been visible. I took a sample of the concrete and put it into a bottle, and for about eight weeks it remained and set like a rock and then it burst the bottle all to pieces. At the same time I took a sample of the cement used, mixed it with 3 parts of Leighton Buzzard sand, and put it into a similar bottle, but this sample has had no effect, although, like the other, it has set extremely hard. In one case where the concrete floor had pushed out the brickwork of the building the brick wall was pulled down and rebuilt, but the concrete floor, which was not disturbed, has again pushed it out. What is the explanation?"

The cement was over-limed. If you will refer to the article on ferro-concrete in last week's issue you will also see that concrete will contract if allowed to set in air, and will expand if kept wet. The usual practice in constructing concrete floors is to leave a space round the walls until all expansion has stopped.

Books on Masonry.

ST. ANNES-ON-SEA.—F. S. writes: "Which is the best book on stonecutting and masonry? I have Purchase's and Dobson's."

There are "Stereotomy," by G. E. Warren, and "Stonecutting and Masonry," by Siebert, both on our book list, but W. R. Purchase's is generally preferred to both of these.

Renaissance Buildings within 100 Miles of Sunderland.

SUNDERLAND.—T. H. R. writes: "Please name any suitable places within 100 miles of Sunderland where I could go during a fortnight's holiday in order to study Renaissance architecture. I know Seaton Delaval, Castle Howard and Duncombe Hall (near Helmsley), but would like some more delicate examples than Vanbrugh."

The following is a list of the best-known Renaissance buildings in the northern counties:—Levens and Lizerg Halls, Westmoreland; Chipchase Castle, Northumberland; Clegg Hall, Astley Hall, Speke Hall (a very fine specimen of half-timber work), Kenyon Peel Gatehouse, Hoghton Tower, Lancashire; Wentworth Hall, Mount Grace Priory, Ingleby Manor, Burton Agnes, Yorkshire. More definite information might be obtained by applying to the secretary of either the

Northern Architectural Association or the York Architectural Society. H. M.

Indentures not Stamped.

HALIFAX.—FOREMAN writes: "Would an apprentice's agreement papers which are witnessed but not stamped be binding and sufficient to keep this apprentice until he was twenty-one years of age?"

Yes, but an employer would have to pay a heavy fine for defrauding the revenue, for the indentures would be admitted as evidence in a court of law. The prospect of paying the fine might prevent an employer insisting on his rights.

IN PARLIAMENT.

(By Our Press Gallery Representative.)

LORD BALCARRES has informed Mr. Whitmore that the First Commissioner of Works is unable to give any undertaking with regard to the suggestion that the enclosure around Canning's statue in Parliament Square should be opened to the public and laid out so as to correspond in appearance and utility with the garden which adjoins it on the south.

Lighting of Parliament Square.

Replying to a question in reference to the lighting of Parliament Square, Lord Balcarras said it was proposed to adopt the type of lamp which had proved so successful in New Palace Yard, and it was expected that the work would be carried out in the autumn so that the lamps might be available before the winter.

Salisbury Memorial in Westminster Abbey.

In the House of Lords on July 7th, Earl Spencer asked the First Commissioner of Works whether he could state what steps had been taken to secure the contemplated memorial in Westminster Abbey to the late Marquis of Salisbury. Without wishing to impede the placing of a memorial to Lord Salisbury in Westminster Abbey, he would like to be assured that the naval memorial to Captain James Cornwall was not going to be done away with or mutilated.

Lord Windsor in reply said that Parliament was concerned to a certain extent with monuments erected by moneys voted by Parliament, but the question of erecting monuments in Westminster Abbey, and their position, rested with the Dean. The question was now a specially difficult one; the Abbey was very full of monuments and it was thought by many persons that there could hardly be left room for more than a few. It was proposed that the monument to the late Lord Salisbury in the Abbey should take the form of a recumbent figure resting on a tomb; the Dean approved of it and offered a site on the north portion of the Consistory Court. This site involved an alteration in the position and the curtailment of the monument which was erected in 1753 to the memory of Captain James Cornwall. It was proposed to place it close up to the west window of the Consistory Court. It was not now in its original position. So serious had been the disfigurement of the architecture of the Abbey, and so great the inconvenience, that considerable portions of this monument to Captain James Cornwall had been cut away in order to reduce its height and give access to the Consistory Court by two small passages, one on either side. He believed himself that the present proposal was a very good one. It would improve the Consistory Court while safeguarding the memory of Captain Cornwall. The work in connection with the Salisbury memorial would be done by Mr. Bodley and Mr. Goscombe John.

"CHIPPENHAM"; CROWTHORNE; BERKS.
BUILT FOR MISS P. AWDRY.

This house was erected in 1903. The walls are of brick, whitened; the paint dark green. It is roofed with sand-faced tiles supplied by Messrs. Collier, of Reading. The house contains six bedrooms, a bathroom, linen cupboard and w.c. on the first floor. A feature is made of the entrance hall with two arches having plaster enrichment against the stairs; also of the verandah connecting the dining-room with the cycle-house. The arrangement of windows on the ground floor has been effectual in screening the drawing-room and dining-room from the view of the next house, which stands to the left of the above view. Mr. Arthur C. Martin, of 75, Newman Street, London, W., was the architect; Mr. J. B. Seward, of Wokingham, was the builder, and the contract price was £967.

Views and Reviews.

Magnetism and Electricity.

This is an excellent student's text-book based upon a previous work by the same author, but brought up to date and with the addition of a considerable quantity of new matter rendered necessary by the progress made in electrical theory during the last few years. The treatment throughout is of an elementary character, the explanations and examples being extremely lucid. The book, which is in three parts and deals with electrostatics, magnetism and current electricity, also contains numerous illustrations which materially add to its value as an educational factor.

"Higher Text-book of Magnetism and Electricity," by R. Wallace Stewart. Price 6s. 6d. University Tutorial Press, Ltd., 157, Drury Lane, W.C.

Alternating Currents.

This is another work of a theoretical character. It is to be completed in two volumes. The first book illustrates the more general mathematical theorems which elec-

tricians use in their everyday work, while the second will treat of the theory of alternators, motors, transformers, converters, and of the transmission of power by polyphase currents. There are a number of references at the end of nearly every chapter which should prove helpful to the student, while the work may generally be recommended to the electrical engineer.

"A Treatise on the Theory of Alternating Currents," Vol. I., by Alexander Russell, M.A., M.I.E.E. Price 12s. nett. London: C. J. Clay & Sons, Cambridge University Press, Ave Maria Lane; and H. K. Lewis, 135, Gower Street, W.C.

Chemistry.

The science of chemistry has advanced so much of recent years that the want of a text-book for elementary students giving instruction from the latest standpoint was greatly felt, and until this book, now in its second edition, appeared in 1900 the need was not supplied. It is fortunate that so eminent an authority in the new chemistry as Professor Wilhelm Ostwald, one of the foremost chemists in the world, should have found time and opportunity to write such an ele-

mentary book of instruction. Although the usual historical arrangement according to the elements of compounds is adhered to, all the latest theories, such as the conception of ions, solutions, &c., take their proper place. The book is most clearly written and well illustrated, and covers a vast ground in a way that will be intelligible to all students who have some general education. Previous books have far too often been written in a style that was only suitable to children. Students of chemistry deserve to be placed on the same plane as students of other sciences; and if books on mathematics and physics can be understood when written in a purely theoretical manner, there is no reason why this book should not be clear to every student of intelligence.

"The Principles of Inorganic Chemistry," by Professor Ostwald. Price 18s. nett. London: Macmillan & Co., Ltd., St. Martin's Street, Leicester Square, W.C.

Law Cases.

An Architect's Claim.—Mr. Philip C. Davies, architect, of Rosendale Road, Herne Hill, sued Mr. Arthur Tollington Angill, of Drayton Gardens, South Kensington, at the Brompton County Court recently for £48 in respect of an alleged breach of contract. A small counter-claim for £2 was admitted. According to plaintiff's story he met the defendant, who was desirous of obtaining £43,000 for the erection of a block of flats, at Drayton Gardens in December, 1903. Mr. Angill led him to understand that he had the major interest in the ground on which he intended to erect the flats, and plaintiff entered into an agreement to prepare the necessary plans and to get the money advanced. Mr. Davies was in train of getting the money when he heard that the property had been put up to auction by a firm of bankers who had had a mortgage on the ground. So the scheme fell through, and plaintiff's trouble was all in vain. Defendant contended that the arrangement with the plaintiff was that the commission was only to be paid if the £43,000 was found. The necessary plans for the proposed flats had been prepared by an eminent architect before the plaintiff entered into the speculation. The judge found for the plaintiff, awarding him 33 guineas and costs.

A Bonus Arrangement.—At the Marylebone Police Court, London, recently, A. Marriott, described as a builder and decorator, of Belle Vue Road, New Southgate, was summoned before Mr. Paul Taylor by Walter Peakall, a young man living at 5, Eastbourne Road, East Ham, for £5 10s. wages due. According to the complainant, in May last he had been out of employment for five months, so he advertised for employment, offering a bonus of £3 if he could be guaranteed regular work. The defendant answered the advertisement and agreed to employ him regularly at 6d. an hour, and the complainant thereupon paid him 30s. on account of the £3 bonus, the balance to be paid at the end of a month. He worked for the defendant 103 hours, and although he made many efforts to get his money, all he had received was 9s. 6d. In making an order against the defendant for £2 2s., with 30s. costs, the magistrate advised the complainant never again to give a bonus for employment.

A Block of Shops at Monifieth, Scotland, has been erected in the High Street from designs by Mr. James Munro, of Monifieth. The various contractors were Mr. Charles Dick, mason; Mr. J. B. Hay, joiner; Mr. T. Dewar, plumber; Mr. William Ross, glazier, all of Monifieth; Messrs. Brand & Son, slaters, Arbroath; Mr. Alex. M'Ritchie, plasterer, Carnoustie; Messrs. T. Melvin & Sons, oven-builders, Glasgow.

SAINT PAUL'S CHURCH, BUSHEY, MERTS.: AUSTIN DURST, M.A., ARCHT.

This building was opened in October, 1904, and is a district church of the old parish. It is not intended to be used permanently as a church, and was designed to be used for secular purposes during the week by cutting off the chancel by means of sliding doors and raising on a platform three rows of chairs at the west end for use at concerts or lectures. The contract, carried out by Messrs. G. & J. Waterman, of Watford, was about £1,200.

PAINTS AND PAINT-WORK.—IV.

(Continued from p. 302, No. 538.)

VEHICLES.—I.

THOUGH the pigments used in paints are very numerous, the vehicles used are comparatively few. Their function is to carry and fix the pigment. They consist of liquids, simple or mixtures, including solids in solution that may be used as the fixing agents. We shall deal with these before the pigments, which latter will be considered in their relation to the vehicles. The principal vehicles are oils, and we will first refer to them.

Oils.

There are two kinds of oils, namely, (1) fixed or fatty oils and (2) essential or volatile oils.

The characteristic property of the former is that they produce a permanent translucent stain upon paper, whereas the latter produce a stain that disappears upon exposure to the air. Fixed oils derive their name from the fact that they cannot be distilled or boiled without change, whereas the volatile oils can be distilled. Essential oils are almost all of vegetable origin. Turpentine may be instanced as an example of an essential oil. The fixed oils are chemically analogous bodies to the fatty oils, fats and waxes. They are practically insoluble in water, but dissolve to some extent in absolute alcohol or strong spirit (especially when hot), and are easily soluble in ether, chloroform, carbon disulphide, benzene, petroleum spirit, turpentine and other volatile oils. Fixed oils and fats are also readily miscible with each other. They are called by chemists glycerides, for they are compounds of glycerine and fatty acids, and, in view of the presence of the latter, are salts, *i.e.*, a combination of an acid radicle and a basic radicle. Glycerine $[C_3H_5(OH)_3]$ is a triatomic alcohol; that is, one, two or three of the molecules of the hydroxyl (OH) that it contains may be replaced respectively by one, two or three acid molecules. Alcohols, it may be explained, are bodies constructed on the model of water, one of the hydrogen atoms in the molecule of water being replaced by a compound radicle. Thus water may be stated as $H(OH)$, and methyl alcohol or wood spirit as $CH_3(OH)$.

The term "ester" is used to distinguish the salts of alcohol radicles, and the glycerides are esters of the glyceryl radicle C_3H_5 , having a constitution expressed by the following formula, $(C_3H_5).y.O_2$, in which y represents the radicle of one of the fatty acids and may have the general formula $C_nH_{2n-1}O$ as the radicle of the stearic series of fatty acids; $C_nH_{2n-3}O$ as the radicle of the oleic series of fatty acids; $C_nH_{2n-5}O$ as the radicle of the linoleic series of fatty acids; $C_nH_{2n-7}O$ as the radicle of the linolenic series of fatty acids; or $C_nH_{2n-9}O_2$ as the radicle of the ricinoleic series of fatty acids. The glycerides or glyceryl esters of linoleic or linolenic acids are the chief constituents of linseed and other drying oils.

Soaps are formed by substituting an inorganic radicle for the glyceryl radicle in glycerides. The alkaline soaps, namely, those of potash, soda and ammonia are soluble in water; but those of lime, lead, copper and similar metals are insoluble in water.

The fixed oils may be divided into two groups: (1) non-drying and (2) drying. The former are by far the larger group of the two, but only the latter are used by painters. These drying oils thicken by the absorption of oxygen from the air, and only those which absorb a considerable quantity are valuable, and the list of these is short. The painter is really concerned with linseed, poppy seed, hemp seed, niger seed and rosin oils. Linseed oil is far and away the most important of

these, and poppy seed and hemp seed oil are used only by artists, with occasionally grape seed and castor oils. Rosin, niger seed, cotton seed and menhaden (a fish) oils are occasionally used as adulterants to linseed oil. The other oils used by artists are preferred to linseed oil, because they have a paler colour and do not affect the tints of the pigments as linseed oil does, but as they are more expensive only the latter is used for ordinary paintwork.

Linseed Oil.

Linseed oil is obtained from the seed of the flax, a plant—*linum usitatissimum*—which is cultivated in America, England, Holland, India, Ireland, Germany and Russia for both its seed and its fibre, the latter being woven into linen. The plant grows best in a cold and temperate climate, and for this reason the East India species, exported from Calcutta, is inferior in quality. The two chief qualities of linseed recognized in the trade are the Baltic, which grows in the north of Russia and comes from Riga and other ports on the Baltic coast of that country, and the Black Sea, which is grown in the south of Russia and is exported from Libau, Odessa and other ports on the Black Sea. The Baltic seed is the best. Seed grown in other countries is used locally, but little finds its way into the English market. The linseed found in the trade is not pure, but is mixed with hemp and rape seed.

How the Oil is obtained.

Two processes are adopted for obtaining the oil from linseed, known as the English and the Anglo-American. In the first-named system the seed is sifted and crushed, ground in a mill of the edge-runner type, then heated for about twenty minutes to a temperature of 150 degs. to 160 degs. Fahr. (thus liquifying the oil and so causing it to flow more freely from the seed while being pressed and coagulating the albuminous and mucilaginous matters contained in the seed, thus preventing them being pressed out with the oil); then placed in bags holding about 18 lbs. of seed and subjected to a pressure of about 750 lbs. to the square inch in a hydraulic press for about twenty minutes, followed by a pressure of about 4,500 lbs. for seven minutes, and finally refining the oil. In the Anglo-American process the seed is first crushed, then heated as in the English process, then moulded into cakes about 1½ ins. thick, weighing about 18 lbs.; fourthly, subjecting these cakes to a hydraulic pressure of about 2,000 lbs. to the square inch for about twenty-five minutes and afterwards to a pressure of 4,500 lbs. for seven minutes, and finally refining. The last in both systems is the same.

Refining the Oil.

The linseed oil as it comes from the press contains the glycerides of the characteristic fatty acids, water, mucilage, a minute quantity of essential oil and vegetable colouring matters. Only the glycerides are of value, and the refining process has as its object the removal of the other constituents, except the colouring matters present which do not injuriously affect the drying properties of the oil, and therefore need not have attention directed to their removal.

The process of refining consists in heating the oil in large tanks to about 160 degs. to 170 degs. Fahr. This makes the oil more fluid and coagulates any albumen which may have passed out of the seed. After the solid impurities have settled the oil is fairly bright, and is occasionally sold in this condition, but it is generally further treated by mixing with it a 6 per cent. solution made of equal parts of water and sulphuric acid. After standing for about twenty-four hours, the acid solution will have settled to the bottom, leaving the oil at the top, and the acid is run off and the oil washed from any remaining traces by means of warm water. The action of the sulphuric acid is to char

and dissolve any albuminous or mucilaginous matters, which bodies are objectionable because they are liable to decomposition and would render the oil rancid. The oil is now in the condition as usually sold under the name of "raw linseed oil."

Properties of Linseed Oil.

The specific gravity of linseed oil ranges from '932 to '937, averaging '935. Baltic oil is usually the heaviest. Linseed oil is soluble in about forty times its bulk of alcohol at ordinary temperatures and five times its volume at boiling point. It readily dissolves in ether, petroleum spirit, shale naphtha, turpentine, chloroform and similar solvents.

Drying Power.

Linseed oil has a much greater power of absorbing oxygen than other oils, and its superiority for paintwork is due to its property of drying on exposure to air.

The following absorption of oxygen per gramme was obtained by experiments:—

Oils.	Cub. centimetres of oxygen absorbed.
Baltic linseed	191
Black Sea	186
American	156
East Indian (Bombay)	130
Ditto (Calcutta)	126
Brown rape	20
Cotton seed	24.6
Colza	17.6
Olive	8.2

The quality of linseed oil depends upon its absorptive power for oxygen, and in this respect Baltic oil ranks superior to Black Sea oil, and this latter to East Indian.

The time taken to dry a thin film of raw linseed oil such as would be produced in painting is about two days. The composition of linoleic acid, one of its chief constituents, is $HC_{18}H_{31}O_2$; and that of linolenic acid, another of its constituents, $HC_{18}H_{29}O_2$.

Upon oxydization the oil forms a body known as oxylinoleic acid, which becomes further oxydized to linoxyn, the composition of which is $C_{32}H_{51}O_{11}$.

This body is quite insoluble in water, alcohol or ether, though it is slightly soluble in chloroform.

Boiled Linseed Oil.

The property of absorbing oxygen valuable to the painter is increased by heating linseed oil to a temperature of 400 degs. to 500 degs. Fahr. for a few hours, and still further increased by adding to the oil while it is being heated certain bodies known as "dryers" (about 5 lbs. to every ton of oil). Oil thus treated is known as "boiled oil."

The boiling is done by the direct heat from the fire or by steam, the usual time taken being about four hours, and it is allowed about eight hours to cool and settle. The steam process of boiling produces an oil of paler colour than the direct heat. The clear oil is only sold as "boiled oil," the turgid oil at the bottom, known as "foots," being used for making putty and by some discredited makers for cheap tins of ready-mixed paints. During the boiling process water is continually given off, together with a large quantity of acrolein (C_3H_4O), a derivative of glycerine, acetic acid ($HC_2H_3O_2$), formic acid ($HCHO_2$), and other acids of the steric series. If the temperature is kept below 400 degs. Fahr. a comparatively pale coloured oil is obtained, but if allowed to go over 500 degs. Fahr. then a dark-coloured oil is produced. Of course, the pale-coloured oil is preferred, though to produce this the boiling has to be continued a longer time. The nature of the "dryers" has some influence on the colour. Manganese gives a darker colour than any other "dryer"; then comes red lead and litharge, while acetate of lead and manganese, and the oxylate of manganese produce the palest oils. The action of the boiling is to produce linoxyn and a combination of linoleic acid with the base of the "dryers," which dissolves and forms a kind of varnish, to which the gloss of boiled oil is due. The action of the "dryers"

is not to yield up oxygen to the oil, but to facilitate the absorption of the oxygen of the air.

"Boiled Oil" produced without Boiling.

Messrs. Hartley & Blenkinsop have patented a process for producing quick-drying oil which has the advantage of making it exceedingly pale in colour so that it can be used for mixing with white pigments with little effect upon the purity of the colour nor darkening or dulling the brilliancy of pale and bright-coloured pigments such as chrome yellow, emerald green, &c.; further, it does not become discoloured on exposure to sulphur-laden air, as boiled oil made with lead "dryers" does. This process consists of treating the oil with dilute sulphuric acid sufficiently strong to remove water and char and dissolve mucilage and to remove some of the colouring matter, while not strong enough to act upon the oil. A manganese linoleate, made by preparing a soap of linseed oil and adding thereto a solution of a manganese salt, is dissolved in turpentine and a small quantity of the solution added to the linseed oil. The solution is raised to the temperature of boiling water and a current of air passed through until it has obtained the desired thickness.

Several other processes have been patented for manufacturing boiled linseed oil.

Properties of Boiled Oil.

The average specific gravity of boiled oil is about .945. The property which the oil has of giving a hard lustrous coat upon exposure to air is valuable, but it is too hard and liable to crack for it to be used alone, and raw linseed oil is always added to endure a more elastic coat.

Adulterants and Substitutes.

Linseed oil is often adulterated, principally with mineral and rosin oils, and occasionally with cotton seed, niger seed and whale oils, and there have been many substitutes proposed, but while the price of linseed oil is low there is no particular advantage to be derived from their use. Even for the cheapest work architects will be well advised to rigidly specify linseed oil and give no loophole for the use of any substitute.

(To be continued.)

Builders' Notes.

Messrs. Mitchell Brothers, of Shalford, have just begun the erection of a new police-station at Tartar Hill, Cobham.

The Works and Stores Committee of the Metropolitan Water Board have recommended for acceptance the tender of Mr. J. Bentley, of Bradford, of £25,442 17s. 8d. for the construction of reservoirs at Cricklewood.

The Atlas Stone Co., Ltd., Cambridge, artificial stone and paving flag makers, have declared a dividend of 5 per cent. on the ordinary shares for the year ending 30th April last, a dividend of 6 per cent. on the preference shares having already been paid.

The Dublin Building Trade dispute has terminated. Under what is known as "rule 7a," the master-builders are to obtain all the advantages conceded by the Union to builders not members of the Association, and where the work is done "by measurement or agreement for such persons" the master-builders are empowered to claim a similar advantage. Further, every employer is to be at liberty to employ tradesmen from "any recognized society of brick and stonemasons in the United Kingdom" upon the understanding that all such tradesmen, should they elect to continue to work in Dublin, are "bound within twelve months from commencing such employment" to join the Dublin Brick and Stonemasons' Union.

London County Council.—At the meeting of the London County Council on July 4th it was decided to erect a new fire-

station at Fulham. The seal of the Council was ordered to be affixed to the agreement with Mr. A. Drury, A.R.A., which provides for the payment of the sum of £1,200 to Mr. Drury for the modelling and casting of each of the eight panels for Vauxhall Bridge, including everything necessary to render the panels fit and ready for fixing. Mr. Drury undertook to indemnify the Council from all claims that might be made by any other persons associated with him in the design and execution of the work. All models and completed castings would be the property of the Council, and Mr. Drury was precluded from reproducing the panels or any part of the designs in any form or shape. In the event of the work not proceeding beyond the stage of sketch models being made, Mr. Drury was to be paid a sum of £100 for each of those made by him. The Education Committee reported that the Plumbers' Company had offered to the Council as a free gift the fittings and appliances belonging to them at King's College, and had also suggested that the Council should offer scholarships to teachers of plumbing, or skilled plumbers who desired to become teachers, to enable them to take a course of instruction in the subject. From enquiries which the committee had made however, they had ascertained that there was not at present any dearth of teachers of plumbing, and in those circumstances they were of opinion that no advantage would accrue by taking over the control of the plumbing school. They were not prepared, therefore, to recommend the Council to accept the offer of the Plumbers' Company of the fittings and appliances at King's College, or to establish scholarships in plumbing, and had so informed the Plumbers' Company.

MODERN FURNITURE AND DECORATION.

THE eighth annual meeting of Messrs. Waring & Gillow, Ltd., was held in London last Friday. Mr. S. J. Waring, junior, who presided, said that the company's business for 1904 showed a profit of £131,551 before providing for income tax, directors' fees and interest, enabling them to pay 7 per cent. dividend on the ordinary shares, to put £15,000 to reserve (which would then amount to £115,000), and to carry forward a balance of £13,585 to the current year.

The year under review was by no means a generally active one for British trade, and the fact that the company did so well might be taken as an indication that they had built on sure foundations. The growth of the annual profits had been continuous. In 1900 the amount, before the deduction of the charges referred to, was £77,155; in 1901, £86,201; in 1902, £101,927; in 1903, £119,983; and in 1904, £131,551—the last two items including the dividends received in connection with the company's holding of ordinary shares in Hampton & Sons, Ltd.

Last Year's Successes.

Last year they were engaged in a number of important contracts, many of which—especially the Sultan of Turkey's yacht, the Waldorf and Lyceum Theatres, and work at the new Savoy Hotel—had won the most favourable opinions of the press. With their exhibit at the St. Louis World's Fair they carried off two Grand Prizes for furniture and decoration, besides gold medals for sanitation, upholstery, &c.; and they had good grounds for hoping, from the work already placed in their hands that the impression made would bear fruit in the United States, now that the States had realized the artistic possibilities of refinement and simplicity in the decorative treatment of their homes.

The Waring-White Building Co.

The year 1904 was further signalized by the formation of the Waring-White Building Co., the object of which was to combine the latest inventions and most useful features of American construction with the soundness and stability associated with British methods. Mr. Waring said he had ventured to predict last year that this combination would mark a new epoch in the building trade. It had already fulfilled its promise. Within nine months from the starting of the foundations in Cockspur Street, the American Shipping Combine were in possession of their new offices; the Ritz Hotel in Piccadilly was being built with a vigorous spirit rarely, if ever, witnessed in England before; and the company had the Liverpool Cotton Exchange and other important buildings in hand, which would be carried out with the same thoroughness and energy. The company worked upon a scientific basis; it was prepared to build on a commission based upon cost, or in competition, guaranteeing to erect its buildings within fixed limits of cost and within fixed dates for completion. It was unnecessary to emphasize the advantages to capitalists where the rapid erection of a building frequently meant an economy in interest during construction of many thousands of pounds. Thoroughness, scientific construction and promptitude were the salient points of the Waring-White Co.'s programme.

Waring & Gillow's New London Premises.

The inadequacy and scattered positions of their present London shop space had hitherto to some extent handicapped their efforts, but these disadvantages were being met by the handsome new building which was being erected for the company in Oxford Street, and which was rapidly approaching completion. It was perhaps superfluous to say anything about a structure which, so far as its exterior went, spoke eloquently for itself, but it would be difficult to name a building directly associated with commerce that had attracted so large an amount of artistic interest and been so universally admired.

In these new premises they hoped to assist public taste in the choice of beautiful domestic surroundings, and to bring within the reach of all classes the possibility of artistic excellence in English homes. Moreover, the householder would find there not only everything he wanted but everything at competitive prices; while at the same time no effort would be spared to maintain the high repute of the firm for those qualities of taste, harmony and proportion which it had consistently and with some success endeavoured to illustrate.

The directors cherished the conviction that the opening of the new premises would be an important landmark in the history of the firm, and it was more than probable that this would result in the early future in the deferred shares becoming a good profit-earning security; but as at present these were almost wholly held by the Waring family and by a trust for the benefit of the employees of the firm, it was the intention of the present Board not to recommend any deferred dividend until the reserve fund reached a quarter of a million.

This expansion would naturally necessitate an issue of further capital, which would be offered for subscription forthwith.*

Mr. Waring then proceeded to speak of the current year's business (which includes a new palace for the Maharajah of Kapurthala), and concluded by emphasizing the need for commercial efficiency and the necessity for better technical and secondary education in order to compete with America and Germany—two rivals of the keenest mettle.

* Particulars are given on pp. xx and xxi of this issue.

Complete List of Contracts Open.

DATE OF DELIVERY	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
BUILDING:			
July 13	Redruth—Lecture Hall, &c.	—	Sampson Hill, Green Lane, Redruth.
" 13	Omagh, Ireland—Gallery	—	Omagh District Asylum.
" 13	Wandsworth, S.W.—Church	—	H. L. Butler, Salesian Schools, Surrey Lane, Battersea, S.W.
" 13	South Mimms—Improvement in High Road	Rural District Council	W. H. Mansbridge, 40 High Street, Barnet.
" 13	Fishburn—Classroom	—	J. G. Wilkinson, Fishburn.
" 14	St. Ives—Alterations to Workhouse	Guardians	Workhouse, near St. Ives.
" 14	London, S.E.—Boundary Walls, &c.	London County Council	Superintending Architect's Department, 15 Pall Mall East, S.W.
" 14	Dundee—Additions to School	School Board	J. H. Langlands, 31 Murray Gate, Dundee.
" 14	Farnham and Woking—Alterations to Schools	Education Committee	Jarvis & Richards, 36 Victoria Street, S.W.
" 15	Evesham—Walls, &c.	Burial Board	G. New, 11 Bridge Street, Evesham.
" 15	Netherton—Alterations at Church	Building Committee	Churchwardens, All Souls', Netherton.
" 15	South Brent, Devon—Alteration to School	Education Committee	S. Brent, Council School.
" 15	Isleworth—Sundry Repairs	Burial Board	E. J. Partridge, Bank Chambers, 39 George Street, Richmond.
" 15	Birmingham—Tramway Depot	—	A. Rowe, King's Court, Colmore Row, Birmingham.
" 16	Gainsborough—School	Education Committee	Scorer & Gamble, Bank Street Chambers, Lincoln.
" 17	S. Shields—Slaughter-houses	Town Council	S. E. Burgess, Chapter Row, South Shields.
" 17	Crosskeys, Mon.—Partial Rebuilding of School	Education Committee	R. L. Roberts, Abercarn, Mon.
" 17	Dromin, Ireland—Two Cottages	Directors	W. H. Mills, Amiens Street Terminus, Dublin.
" 17	Jarrow—Alterations to Schools	Education Committee	T. H. Spencer, Education Office, Town Hall, Jarrow.
" 17	King's Norton—Library	Urban District Council	A. W. Cross, 23 Valentine Road, King's Heath, Birmingham.
" 17	Merthyr—Altering Hall	—	C. M. Davies, 112 High Street, Merthyr.
" 17	Higher Broughton—Four Shops	—	E. Woodhouse, 88 Mosley Street, Manchester.
" 17	Portsmouth—Pulling-down Villa and Erecting caretaker's House on Site	Education Committee	A. H. Bone, Cambridge Junction, Portsmouth.
" 17	London, S.W.—Alterations to Basement of Library	Public Libraries and Museums Committee	Public Library, Manresa Road, Chelsea, S.W.
" 18	Glanawmor—Villa	—	J. Jones, Dolwen, Rhydlewis.
" 18	Ashford—Sorting Office	Commissioners	Post Office, Ashford.
" 18	London, W.—Thirteen Houses at Uxbridge	Great Western Railway Company	Engineer, Paddington Station.
" 19	Beckenham—Extensions to School	Urban District Council	J. A. Angell, Architect to Education Committee, Beckenham.
" 19	Leigh-on-Sea—Iron Building	Education Committee	J. H. Nicholas, County Offices, Chelmsford.
" 19	London, N.E.—Alterations, &c., to Boardroom	Guardians	J. W. Dunford, 100c Queen Victoria Street, E.C.
" 20	Heywood—School	Education Authority	J. E. Mills, Market Place, Heywood.
" 21	Nantymoel—Additions to Institute, &c.	Committee	J. M. Williams, Architect, Blackmill.
" 21	Weardale—Organ-chamber	—	W. Brown, St. John's Chapel, R.S.O., co. Durham.
" 22	Penge, S.E.—Depôt Buildings	Urban District Council	H. W. Longdin, Town Hall, Anerley, S.E.
" 22	Winsford—Bakery	Industrial Co-op. Society	Company's Office, 21 High Street, Winsford.
" 24	Wrexham—Infirmary	Guardians	G. Morrison, King Street, Wrexham.
" 24	Tottenham—Summer Repairs to Schools	Education Committee	W. H. Prescott, 712 High Road, Tottenham.
" 25	London, S.W.—Block of Dwellings	London County Council	Housing Section of Architect's Department, 19 Charing Cross Rd., W.C.
" 25	West Ham—Tramway Office, &c.	County Borough	J. G. Morley, Town Hall, West Ham.
" 29	Widnes—Premises	Industrial Co-op. Society	Society's Offices, 406 Church Street, Runcorn.
" 31	Stoney, E.—Extension of Library	Council	M. W. Jameson, 15 Great Alie Street, Whitechapel, E.
Aug. 1	Buckingham—New Royal Latin School	Governors	Town Hall, Buckingham.
" 1	Carlisle—School Buildings	Education Committee	A. H. Collingwood, 15 Fisher Street, Carlisle.
" 5	Sheffield—School	Education Committee	Secretary, Education Committee, Education Offices, Sheffield.
No date	Chesterfield—Church and Schools	—	W. C. Jackson, 29 Knivesmith Gate, Chesterfield.
ENGINEERING:			
July 13	Rotherham—Griststone Culvert	Rural District Council	R. Bradbury, 29A High Street, Rotherham.
" 13	Birkenhead—Roofing Reservoir	Gas and Waer Committee	J. W. M. Richardson, Water Engr.'s Office, 52 Balls Rd., Birkenhead.
" 14	Earby, Skipton, Yorks—Sewage Tanks	Rural District Council	H. A. Johnson, 15 Exchange, Bradford.
" 14	Lerwick—Water Pipes	Town Council	G. Cruickshank, Borough Surveyor, Lerwick.
" 15	Belfast—Heating, &c., Institute	Library and Technical Instruction Committee	S. Stevenson, 83 Royal Avenue, Belfast.
" 17	Leicester—Laying Mains	Water Committee	J. B. Everard, 6 Millstone Lane, Leicester.
" 17	West Ham—Electric Lighting, &c.	Education Committee	W. Jacques, 2 Fen Court, Fenchurch Street, E.C.
" 17	Maidstone—Repairing Bridge	Rural District Council	M. C. Warne, Surveyor, Barming, near Maidstone.
" 17	Neath—Mains	Rural District Council	Council Offices, Orchard Street, Neath.
" 17	Dartford—Extension of Electricity Works	Urban District Council	T. E. Tiffin, Council Offices, Dartford.
" 18	Loughborough—Cables, &c.	Gas and Electricity Committee	W. H. Allen, Electricity Works, Bridge Street, Loughborough.
" 18	Stourbridge—Wiring	Guardians	G. F. James, 12 Hagley Road, Stourbridge.
" 18	Londonderry—Engines	County Council	County Surveyor, County Court House, Londonderry.
" 19	Lisbon, Portugal—Iron Bridge	—	1, a Reparticao da Direcção Geral de Obras Publicas Minas.
" 19	Burton-on Trent—Jointing, &c.	Rural District Council	Willcox & Raikes, 53 Temple Row, Birmingham.
" 21	West Hartlepool—Outlet Extension	Corporation	N. F. Dennis, Municipal Buildings, West Hartlepool.
" 22	Scalloway, Shetland—Water-supply	—	Jenkins & Marr, 16 Bridge Street, Aberdeen.
" 24	Antwerp—Heating Apparatus	Commercial Intelligence Branch of Board of Trade	Hotel de Ville, Antwerp.
" 25	Dublin—Locomotives	Cleaning Committee	S. Harty, City Hall, Dublin.
" 26	West Hartlepool—Iron Covering	Corporation	N. F. Dennis, Municipal Buildings, West Hartlepool.
" 28	Hull—Supply and Fixing of Constructional Steelwork	Corporation	City Architect, Town Hall, Hull.
" 29	Lydbrook—Culvert	Education Committee	M. H. Medland, 15 Clarence Street, Gloucester.
Sept. 1	Merthyr Tydfil—Destructor Plant	Urban District Council	T. F. Harvey, Town Hall, Merthyr.
IRON AND STEEL:			
July 13	Leeds—Pipes	Corporation	C. G. Hensell, Municipal Buildings, Leeds.
" 14	London, S.E.—Iron Fencing	London County Council	Parks Department, 11 Regent Street, S.W.
" 17	Leicester—Sluice Valves, &c.	Water Committee	J. B. Everard, 6 Millstone Lane, Leicester.
" 18	Wolverhampton—Iron Fencing	Hospital Board	Engineer's Office, Town Hall, Wolverhampton.
" 21	Valetta—Manhole Covers, &c.	—	Crown Agents for Colonies, Whitehall Gardens, S.W.
PAINTING AND PLUMBING:			
July 13	Lambeth, S.E.—Redecorating Premises	Borough Council	H. Edwards, 346 Kennington Road, S.E.
" 14	East Ham—Whitewashing, &c.	Education Committee	Education Office, East Ham.
" 14	Salford—Whitewashing	Guardians	Steward, Union Infirmary, Salford.
" 15	Isleworth—Painting Work, &c.	Burial Board	E. J. Partridge, Bank Chambers, 39 George Street, Richmond.
" 17	Bristol—Painting and Colouring at Schools	Education Committee	P. Addie, City Valuer's Office, Council House, Bristol.
" 17	Settle—Painting	Rural District Council	T. A. Foxcroft, Town Hall, Settle.
" 18	Leeds—Painting at Schools	Education Committee	W. Packer, Education Offices, Leeds.
" 20	Cork—Redecorating Interior of Church	—	S. F. Hynes, 21 South Mall, Cork.
" 21	Stockport—Interior and Exterior Painting	Watch Committee	J. Atkinson, Borough Surveyor, Stockport.
" 22	Conway—Oils, &c.	Town Council	Borough Surveyor, Town Hall, Conway.
" 25	Leeds—Painting, &c., Rooms	—	City Engineer's Office, Leeds.
Aug. 28	Gateshead—Cleaning and Painting at Schools	Education Committee	E. J. Harding, Education Offices, Gateshead.
ROADS AND CARTAGE:			
July 13	London, N.E.—Woodpaving	Hackney Borough Council	N. Scorgie, Town Hall, Hackney.
" 13	Khondra—Street Works	Urban District Council	W. J. Jones, Public Offices, Pentre, Rhondda.
" 13	South Mimms—Road Improvement	Rural District Council	W. H. Mansbridge, 40 High Street, Barnet.
" 13	Cardiff—Ballasting	Jones & Warne	C. T. Evans, 8, Queen Street, Cardiff.
" 13	Finsbury—Repairing Stone Steps	Radical Club	Secretary, Radical Club, Central Finsbury.
" 14	Dundee—Road Works	School Board	J. H. Langlands, 31, Murraygate, Dundee.
" 15	London, W.—Woodpaving	Paddington Borough Council	Borough Surveyor, Town Hall, Paddington.
" 17	Devonport—Street Cleansing, &c.	Corporation	R. J. Fittall, Town Clerk's Office, Devonport.
" 17	Paignton—Widening, &c.	Urban District Council	C. O. Baines, Town Hall, Paignton.
" 17	West Ham—Terrazzo Paving	Education Committee	W. Jacques, 2 Fen Court, Fenchurch Street, E.C.
" 18	Luton—Stones	Rural District Council	B. B. Franklin, 21, Market Hill, Luton.
" 18	East Barnet—Making-up Street, &c.	Urban District Council	H. York, Council Offices, Station Road, New Barnet.
" 18	Luton—Stones	Rural District Council	B. B. Franklin, 21, Market Hill, Luton.
" 18	London, S.W.—Roadwork and Platelaying	London County Council	County Hall, Spring Gardens, S.W.
" 18	Brentford—300 yds. Blue Guernsey Granite	Urban District Council	N. Parr, Clifden House, Boston Road, Brentford.
" 22	Conway—Portland Cement, &c.	Town Council	Borough Surveyor, Town Hall, Conway.

Tenders.

Kinnersley (Herefordshire).—Messrs. Groom & Betington, of Hereford, the architects for alterations and additions to Kinnersley Castle, point out in reference to the list of tenders on p. xxiv of our issue for last week that in accepting Mr. Powell's tender (the lowest but one) the time of completing the work was taken into consideration.

Slimbridge (Gloucestershire).—For the proposed Council School, Slimbridge, to accommodate 200 scholars, for the Education Committee. Mr. R. S. Phillips, surveyor:—

Common brick facing.

Workman & Sons	£2,442	3	11
W. T. Nicholls	2,189	0	0
W. Jones	2,160	0	0
A. S. Cooke	2,117	12	0
A. Estcourt & Son	2,100	0	0
Wall & Hook	2,038	0	0
H. J. Morgan & Sons	1,980	0	0
Byard & Sons	1,984	0	0
J. Gurney	1,987	0	0
Collins & Godfrey	1,970	0	0
Orchard & Peer	1,935	0	0
G. Dimery & Sons	1,960	5	3
S. Bloodworth & Son	1,950	0	0
W. Bowers & Co.	1,944	0	0
N. Baxter & Sons	1,920	0	0

Pressed brick facing.

Workman & Sons	2,462	3	11
W. T. Nicholls	2,000	4	6
W. Jones	2,193	10	0
A. S. Cooke	2,127	12	0

Robinson & Son	11,518	6	1
W. C. Broadhurst	11,423	7	4
D. Mullaney	11,229	0	0

[Rest of Stockport.]

Tir Phil (Wales).—For the erection of twenty or more cottages at Tir Phil, for the Tir Phil Building Club. Mr. P. Vivian Jones, architect and surveyor, Penegod:—

Jewel & Davies, Deri	£3,600	0	0
W. & D. Thomas, Bedwas, Mon.	3,400	0	0
T. Davies, Merthyr	3,370	0	0
Gibbon & Sons, Cardiff	3,196	16	8
Vodden & Lee, Gilfach, Pengam	3,080	0	0
R. Lloyd, Cefn Coed, Merthyr Tydfil	2,900	0	0
Sketchley & Co., Abergavenny	2,797	10	0

* Accepted.

(Continued on page xviii.)

The Lady Chapel in Winchester Cathedral has been adorned with an elaborate oak and mahogany reredos richly painted and gilded. The subject is the Annunciation, and the work was designed by Mr. J. A. Kempe.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

DURING THE WEEK ending July 7th twenty-one failures in the building and timber trades in England and Wales were gazetted.

J. J. GODFREY, builder, Coventry.
FOWLER BROTHERS, decorators and building contractors, Stratford and Goodmayes. Adj. June 26th.

T. ROGERS, plumbers and painters' general merchants, Urmoston and Manchester. R.O. June 28th.

W. N. RICHARDSON, painter, paperhanger and decorator, Leicester. R.O. July 1st. Adj. July 1st.
W. THEOBALDS, architect and surveyor, 29, Bridge Row, E.C., and South Norwood. R.O. June 29th.

J. HARLEY & SON, builders, Smethwick. Adj. June 27th.

W. GUEST, painter and plumber, Dudley. Liabilities £731; deficiency £487.

A. E. VALLINTINE AND J. S. CHANDLER, plumbers and painters, Dover. Liabilities £178; assets £78 12s.

W. J. KENNEY, architect, Birkbeck Bank Chambers, London. Liabilities £283 12s. 2d.; assets £166.

W. C. HODGES, builder, Kempsey. Gross liabilities £215 16s. 11d.; assets £15.

A. E. LONGDEN, building contractor, Eastville, Bristol. Liabilities £751; assets £641.

J. PVEY & SONS, builders and house decorators, Anerley. Liabilities £833; assets £175.

H. CROOKES, builder, Sheffield. Gross liabilities £1,816; £591 expected to rank for dividend; assets £410.

H. GREGORY, builder, Woburn. P.E., Luton C.C., July 27th, at 11.30.

J. HUNT, surveyor, Old Trafford. R.O. June 26th. P.E., Salford C.C., July 24th, at 11.

G. THORNBY, builder and contractor, Ashby-de-la-Zouch. P.E., Burton-on-Trent C.C., July 19th, at 12.

C. BUTLER, builder, Bow and Leigh-on-Sea. R.O. June 27th. P.E., Bankruptcy Court, Aug. 2nd, at 11.

T. J. THOMPSON, painter and decorator, Church Stretton.

W. BOUGHEY, builder, New Brighton. Liabilities £1,693; assets £2,512.

WALLEY & SONS, builders and contractors, Wolstanton (late Stoke-on-Trent). P.E., Town Hall, Hanley, July 26th, at 11.

R. HUNT, builder and contractor, Sheffield. Gross liabilities £18,699; £1,562 expected to rank for dividend; assets £2,688.

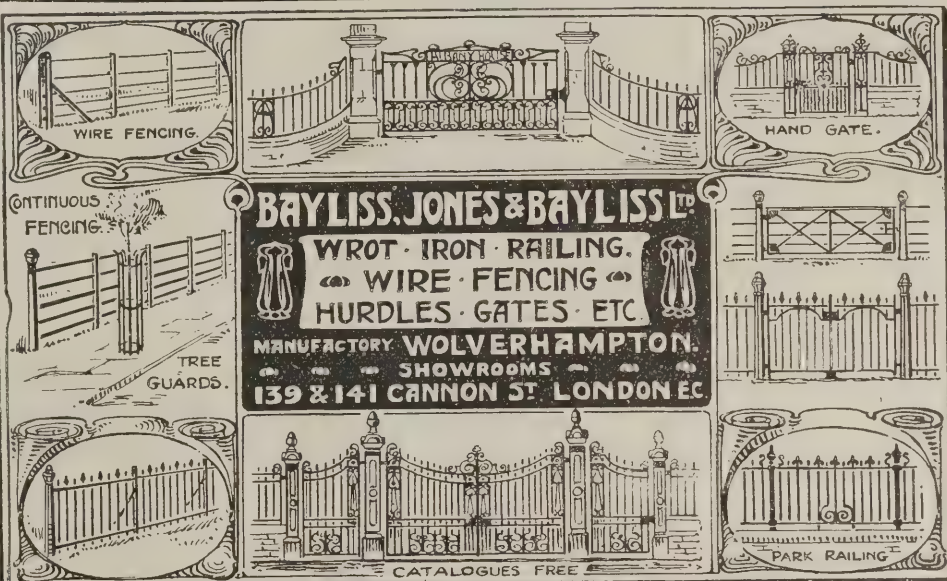

T. EMSDEN, builder, Ipswich. First meeting, O.R.'s, Ipswich, July 14th, at 2. P.E., Shirehall, Ipswich, July 14th, at 10.30.

ARMY CONTRACTS.

SALE OF SURPLUS BOILERS, DISTILLING APPARATUS, DYNAMOS, AND OTHER PLANT AT BERMUDA, BARBADOS, ST. HELENA, AND WOOLWICH.

The Secretary of State for War is prepared to receive Tenders for the purchase of surplus Boilers, Distilling Apparatus, Dynamos, and other plant now lying at Bermuda, Barbados, St. Helena, and Woolwich, most of which is in first-rate condition, some lots being unused.

Forms of Tender, giving full description of the plant, particulars as to condition of the several lots and terms of contract, may be obtained on application to the undermentioned Office.

The Tenders are to be delivered at the War Office, Pall Mall, London, S.W., by TWELVE o'clock noon on 1st September, 1905.

War Office,
Pall Mall, S.W.
3rd June, 1905.

TO BUILDERS AND CONTRACTORS.

TENDERS are invited for the ERECTION of 40 HOUSES near Tyers Arms, Blaina, Mon., for the Blaina Building Club.

Plans and Specifications can be seen at 7, Queen Street, Nantyglo, Mon. Specification can be obtained upon deposit of £1 is., which will be returned on receipt of a bona-fide Tender.

Sealed and endorsed Tenders to be sent to the Chairman of the Committee, THOMAS JONES, Esq., Bronfin House, Blaina, Mon., on or before July 12th, 1905.

The lowest or any Tender not necessarily accepted.

WILLIAM THOMAS,
Architect and Surveyor,
Nantyglo, Mon.

CENTRAL FINSBURY RADICAL CLUB.

326, City Road, E.C.

The Committee of the above club are prepared to receive TENDERS for REPAIRING a Set of STONE STEPS leading to their Lecture Hall.

Specification may be seen by applying between the hours of TWELVE and THREE o'clock.

Tenders, endorsed "Repairs to Steps," must be addressed to the SECRETARY not later than THURSDAY, THREE o'clock, JULY 13th.

C. W. HARDING,
Secretary.

EMPLOYMENT REGISTER.

Too late for Classification.

- 1227.—GENERAL OR WORKING FOREMAN (Carpenter), alterations; sole charge, jobbing, &c.; exp. in all branches.
- 1231.—FOREMAN OF JOINERS; accurate setter out; good refs.
- 1232.—ARCHITECT'S ASSISTANT; contract drawings, details, surveying; mod. s.
- 1233.—ARCHITECT'S ASSISTANT (A.R.I.B.A.); Prov. preferred; extensive experience; design details, and exp. quan. sur.; ex. refs.; mod. s.
- 1235.—PAINTERS' WORKING FOREMAN; good all-round man, exp. of all branches; good references; abstainer.
- 1236.—PAINTER; good all-round hand; town or country; abstainer.
- 1237.—ARCHITECT'S ASSISTANT (32); exp. draughtsman; specifications and quantities; sal. 55s.; country preferred.
- 1238.—ARCHITECT AND SURVEYOR'S ASSISTANT; exp. and capable; quantities, wkg. drawings, steelwork construction, details, surveying and levelling; mod. s.
- 1239.—PLUMBER, young; gas and hot-water, zinc, and electric bells; exp. in latest sanitary improvements.
- 1240.—ARCHITECT AND SURVEYOR'S ASSISTANT, 3½ yrs. varied exp.; wkg. drawings, surveying, levelling, &c.; mod. s.
- 1241.—DRAWINGS, DESIGNS, DETAILS, SPECIFICATIONS, Drain Plans and Quantities prepared. Terms mod.
- 1242.—CLERK OF WORKS OR ASSISTANT. Good draughtsman, setter out. Sanitary engineering. Quantities, practical, trustworthy.

See p. xxii for the Employment Register.

Privileges open to all Regular Readers of the "Builders' Journal."

I.—Free Monthly Advertisements.

1. A Free Advertisement of 12 words in the Wanted or Miscellaneous Advertisement Columns, in one issue of the BUILDERS' JOURNAL during each calendar month will be given to any regular reader.

2. The charge of one penny will be made for each additional word.

3. Advertiser's Name and Address or Box Number must be counted, but will in no case be reckoned as more than five words.

4. All advertisements must be accompanied by the correct remittance, and should a receipt be required a stamped addressed envelope must be enclosed.

5. The Proprietors reserve to themselves the right of refusing any advertisement.

II.—Free Answers to Enquiries.

1. The services of a large staff of experts are at the disposal of all regular readers who require information on architectural, constructional or legal matters.

2. Questions should in all cases be addressed to the Editor, and be written on one side of the paper only.

3. Correspondents are particularly requested to be as brief as possible.

4. The querist's name and address must always be given, not necessarily for publication.

Note.—Owing to the large number of enquiries we receive weekly, we are compelled to restrict the advantages of this department to Regular Readers.

III.—Free Accident Insurance of £500.

1. Every regular reader of the BUILDERS' JOURNAL is entitled to the benefit of this Insurance.

2. A Pamphlet giving full details of this and other Insurance schemes inaugurated by the BUILDERS' JOURNAL for the benefit of its readers, and guaranteed by "The Ocean Accident Corporation, Limited," will be sent on application.

What is a Regular Reader?

We have employed the term "Regular Reader" throughout these announcements as the description "subscriber" is often understood to mean one who subscribes direct to the publishing office.

We mean by a Regular Reader anyone who has placed an order with us or any newsagent or bookstall for the BUILDERS' JOURNAL for one year.

Those readers who order the BUILDERS' JOURNAL through their local newsagent or bookstall should send us the newsagent's receipt. Their names will then be placed on our subscribers' list, and they will be entitled to all the advantages set out above.

5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS.

OFFICE: 6, GREAT NEW STREET, FETTER LANE, E.C.

VILLAGE ARCHITECTURE IN FINISTERE.

(Concluded from p. 20, No. 544.)

PLUGASNOU is a place of some importance, and boasts a mayor and a "percepteur," or rate collector, not to mention a convent and three priests. There is a good-sized square in the middle of the village, on one side of which is the church, standing in a large cemetery and surrounded with stunted beech trees. The church is a strange jumble of work of all dates and styles, an architectural conundrum, which in some respects almost defies solution. Thus the south arcade of the nave has plain square piers and arches, two of which are round and one pointed, and whether this is of eleventh- or of seventeenth-century work it is hard to tell. As, however, the westernmost bay of the arcade is undoubtedly seventeenth century, and as it is of quite different character to the rest, it is at least possible that the plainer parts of the work may be the remains of an early church. According to this theory the original building would seem to have been an aisled Romanesque church with transepts, the large pointed arch of the south arcade having been that of the south transept. The chancel was rebuilt in a very English manner, with octagon piers and chamfered arches, some time about the end of the fourteenth century. This part of the church is carefully built in granite ashlar work, the east window being of six lights with reticulated tracery. Afterwards the north aisle was rebuilt in late Flamboyant style, with an arcade of moulded arches dying into round pillars. The work in this part of

PLUGASNOU
CHURCH.

the church is less excellent than that in the chancel – the walls of rubble instead of ashlar, the buttresses lean and widely spaced, the windows mis-shapen. Evidently the village had grown and the church had to be enlarged as cheaply as possible. At this period circular pillars were built up at the backs of the octagonal ones on the north side of the chancel, as if it had been intended to rebuild the whole church to match the north aisle; but this work, if ever contemplated, was not carried out, and now these pillars run sheer up to the aisle wall-plate without any arches at all. In the seventeenth century another scheme of rebuilding was set in hand, but all that was done was to replace the western bay of the south arcade with clustered pilasters and wooden architraves, to rebuild the south aisle wall, and to build a new steeple and the south porch. These successive alterations have left us a most pictorial church, interesting and delightful as a piece of history, but not a coherent design such as we have in churches like Lanmeur or St. Jean du Doigt. It is long and low, with a big slated roof over nave and south aisle and a separate span of roofing to the north aisle. The one really beautiful piece of detail is the tiny chantry built out from the south aisle of the chancel. This measures only about 12ft. by 7ft. 6ins. inside, but it is wonderfully finished. The south gable has large crockets and a finial as if for a statue, below which is a two-light window set in deep mouldings. Under this window, inside the chapel, is an ogee-canopied tomb with a finial carrying a quaintly treated representation of the Blessed Trinity carved in wood and painted. On the east wall are image brackets above the site of the altar, and carved double cornices in granite carry an elaborate coved roof of the local type with a miniature tie-beam in the centre held in dragons' mouths.

The seventeenth-century work in the tower and nave is very Jacobean looking, carefully

CHAPEL PLUGASNOU CHURCH.

CHAPEL, PLUGASNOU CHURCH.

built but rudely ornamented. As a piece of design, however, the tower and its spire are most effective. They are built entirely in dressed granite, the lower stages having bold massive buttresses and balconies between, which recall the open galleries at St. Jean du Doigt, but are perhaps more effective from their bolder projection and greater variety.

Renaissance steeples are not uncommon in Brittany. There is a well-known example at Roscoff, besides those at Plougasnou and Lanmeur. And should the patriotic British tourist see Plougasnou steeple and think on Bow Church, let him reflect that the humbler of the two fits its surroundings no less than the more ambitious, and that Bow steeple would be no less out of place in a quiet country churchyard than Plougasnou spire in the middle of Cheapside.

The interior is full of romance, from its extraordinary lack of symmetry and order. Each generation has left its mark on the place, and the ghosts of its builders seem to haunt its mysterious recesses. Moreover, the church has an added charm from retaining much of its old furniture. The lower part of the rood screen stands in its place at the entrance of the chancel, which is fitted with simple seventeenth-century stalls and enclosed with wooden parcloles of the same date. There is a big gabled lectern in the quire, and the high altar has an early Renaissance reredos consisting of three delicate open-work turrets in metal with pierced tracery work between them. There is a splendid silver processional crucifix with figures of Our Lady and St. John and little bells hung about the Cross. In the west gallery is a large disused organ. The font is plain and enclosed with a simple balustrade of wood, and, in a forgotten corner of the north aisle, covered with dust and hidden behind a pile of chairs and lumber, is an altogether admirable wooden lectern with a great gabled desk and a support of wooden pillars. An interesting piece of furniture stands against the south-east pier of the nave: it is an altar-like slab of stone with a square sinking in the middle supported on clumsy seventeenth-century balusters. At present it is used as a shelf for candlesticks that are not in use, but it was apparently designed either for a "cresset stone" or else for a kind of credence for offerings.

The churchyard is full of gravestones of a rather singular type. Most of these are plain flat slabs, though a few are slightly raised after the manner of altar-tombs. The slabs are carved almost invariably with a cross between a pair of candlesticks, below which is an inscription in raised letters. Each grave has a receptacle for holy water, either sunk in the slab itself or else in the form of a small stone basin, and these are from time to time replenished from the stoup in the church porch.

PLOUGASNOU CHURCH.

Until a year or two ago Plougasnou churchyard possessed a mortuary-chapel and a tall stone cross with a stone Gothic pulpit at its base. These have been taken down and rebuilt stone for stone in the new cemetery; and in 1896 the "commune" had

Grave Slab
Plougasnou
30.9.96 CAN

an odious project for turning the old churchyard into a public garden and uprooting the old tombstones. The craze of "new lamps for old—new lamps for old" has made itself felt, too, inside the church, where (in 1896) the last of a series of simple old seventeenth-century confessionals was replaced with a modern Gothic affair in varnished chestnut picked out with black lines. The south side of the church has also been recently repointed in staring

white mortar, and all the old furniture of the building has been grained. A few years ago it was painted a cool green in admirable harmony with its surroundings. A wide sandy beach extends along the channel coast from Plougasnou to St. Jean du Doigt, but to the west of Plougasnou the shore is steep and rocky as far as the fishing village of Trégastel, situate on a broad estuary with distant views of the spires of St. Pol de Léon across the water. The rocks at Trégastel are worn into fantastic shapes and enclose a harbour for a small fleet of fishing smacks. The village itself is swamped by an immense hotel, but on the cliffs between Plougasnou and Trégastel stands a little seventeenth-century chapel with its original altar and fittings very much in the condition in which its builders left it. On the Trégastel-Plougasnou road is a stone manor-house with round extinguisher-capped tower, standing in a deep green valley, surrounded with trees and partly overgrown with creepers. This house forms one corner of a quadrangle around which the farm buildings are placed. On the Plougasnou-Morlaix road is a hamlet with a small church adjoining and almost indistinguishable from a group of stone cottages. Church and cottages both appear to date from the seventeenth century. Past occasional wayside crosses and distant village spires, the road takes us back to Morlaix, a town full of architectural and historic interest but at which, as being by virtue of its railway station the gate of the outer world, we may fitly end our glimpse of Finistère village architecture.

In the churches that have been described there is great variety of arrangement and "motif," although their details show a strong family likeness. The larger houses, and even the cottages, are all without exception built of great blocks of granite, and it is only in

SEVENTEENTH-CENTURY CHAPEL NEAR PLOUGASNOU.

CHURCH AND COTTAGES ON PLOUGASNOU-MORLAIX ROAD.

the unimportant details that the earlier work differs from the later. Instances occur of rubble buildings plastered between stone dressings and quoins, but even in these cases the unusual size of the stones used gives the prevailing local flavour to the work. To eyes accustomed to the prettiness of brickwork the use of these ponderous materials gives an air of distinction to the smallest cottages. Several houses in Morlaix near the Carmelite fountain, though of perfectly plain design, are nevertheless quite imposing from the nature and treatment of their materials, but buildings such as these miss alike the cheeriness and comfort of our English brickwork and that indescribable refinement which we find in our domestic work in freestone districts such as Somerset and Northants. All these kinds of buildings, however, are alike in that they reflect their builders' temper, and therefore each is worthy of study in equal degree.

The building materials native to North Brittany are granite and slate. The granite where used as ashlar is usually built with very wide joints, especially in the later work. Rubble walling is generally uncoursed in the district, the stones being often mere boulders untouched with the tool. The slates used north of Morlaix are mostly a small greenish variety of stone slates, but in other parts of Brittany thin purple and blue slates from Angers are the commonest roof-covering. The usual gauge of the slating is about gins., the slates varying from 6ins. to 9ins. in width, but some of the stone slates are occasionally rather larger than this. Generally speaking, the texture and colour of the old

and some of the newer buildings is delightful, and the work of the district gives ample proof, if proof is needed, that good building looks better than mediocre "architecture." The buildings that have been described are not a specially-selected series, and are all situate in a small and not wealthy district. But here, as in many parts of England and the Continent, one may find much that is worthy of study in a small compass, and an atmosphere of old traditions and ways of building which cannot but have a certain

HOUSES IN MORLAIX.

invigorating effect upon work which has to be done under conditions more adverse than those under which were produced the masterpieces of our forefathers. C. A. N.

IN PARLIAMENT.

(By Our Press Gallery Representative.)

Revised Regulations for School Planning.

THE Board of Education has presented to Parliament a set of building regulations relating to the planning and fitting up of new buildings for public elementary schools. One of the first-mentioned principles to be observed is that the rooms must be grouped compactly and conveniently so as to secure proper organization and supervision. It is important to remember that the number of places provided in any room depends not merely on its area but also on the lighting, the shape of the room, and the position of the doors and fireplaces, which should be arranged so as to allow the whole of one side of any room to be left free for the groups of desks. For large departments containing from 350 to 500 places the most suitable plan is that of a central hall, with the classrooms grouped round it. As a rule such a department would require from seven to ten classrooms. Smaller departments may be planned conveniently with the classrooms opening from a corridor; and a similar plan may be adopted even for larger departments. Where the site is sufficiently large, open and fairly level, the most economical plan is that in which all the rooms are on the ground floor, and this arrangement is preferable on educational grounds. It is

desirable that a building for use as a public elementary school should be on not more than two floors.

Where there is a central hall it should have a floor space of not more than 4 sq. ft. for each scholar for whom the school is recognized. About $3\frac{1}{2}$ sq. ft. for each scholar will be sufficient. Where outdoor space is not available, physical training should be given in the central hall or corridor, and this purpose should be taken into consideration at the time when the building is planned.

Since fixed gymnastic apparatus is unsuitable for children under fourteen years of age, a separate gymnasium is not required and cannot be approved.

Corridors.

Large schools not built with a central hall must be provided with a wide corridor giving access to the rooms, and two or three of the rooms ought to be divided from one another by movable partitions.

A corridor should be fully and directly lighted and ventilated and from 8ft. to 12ft. wide.

Where a schoolroom is the principal room in a school which has neither central hall nor corridor it should never be designed for more than 100 children, and a room of even smaller size is desirable.

No schoolroom lighted from one side only can be approved. The gable ends should be fully utilized for windows, and there should be no superfluous windows opposite the teacher.

When a school consists of a single room that room should not contain more than 600 sq. ft. of floor space. Both schoolrooms and classrooms must have independent entrances. A classroom should not be planned to accommodate more than fifty to sixty children, but in special cases somewhat larger rooms may be approved. In the absence of supplementary light the measurement from the window wall in a room 14ft. high should not exceed 24ft. 8ins. A room approximating to a square is most satisfactory.

Infants' Schools.

After directions regarding desks, the Board point out that in the case of a building for older scholars the plans for the schoolroom and classrooms must show an average of not less than 10 sq. ft. of floor-space for each place proposed to be provided. In the case of infants' schools it is suggested that the partitions between them and other school or classrooms should be impervious to sound. The infants' school and playground should always be on the ground floor, and no classroom should accommodate as a rule more than sixty infants. The plans must show, in the case of a building erected wholly for the use of infants, an average of not less than 9 sq. ft. for each place. Provision must also be made for exercise.

A number of detailed directions are given as to rooms for cookery, handicraft, &c. In the case of higher elementary schools the curriculum should be determined before the architect is instructed. It is pointed out, however, that for a school accommodating from 300 to 350 scholars eight to ten classrooms will generally be required, none of which should accommodate more than forty scholars. Numerous directions are given as to the classrooms for different subjects.

A number of important rules follow relating to sites and playgrounds, walls, floors and roofs, entrances, staircases, cloakrooms, lavatories, lighting, ventilation, warming, sanitary arrangements and water-supply. Before recognising newly-erected premises as suitable for a public elementary school, the Board must be satisfied by the submission of plans that the building regulations have been complied with. Directions are also given as to the manner in which plans are to be prepared for submission to the Board.

HOUSES IN MORLAIX.

The rules and regulations cover fourteen pages of foolscap.

Charing Cross Subway.

In the House of Commons last week Sir Walter Plummer asked Lord Balcarras whether his attention had been called to the Bill now before Parliament for constructing among other things a subway commencing on the south side of Charing Cross and terminating near the south-east corner of the base of the Nelson Monument, and whether His Majesty's Office of Works could do anything to prevent this further encroachment upon Trafalgar Square, which had already been disfigured by the subway which was at last approaching completion.

Lord Balcarras said the answer to the first paragraph of the question was in the affirmative. The plans and drawings had all been seen and approved by the First Commissioner, who was satisfied that no disfigurement would be caused. The encroachment referred to was small in comparison with the advantage of the subway to the public.

WORKMEN'S HOUSES AT SHEFFIELD.

THE accompanying illustration shows a portion of a block of twenty houses proposed to be erected by the Sheffield Corporation at High Wincobank, about four miles from the centre of the city. The design was selected in a recent competition limited to Sheffield architects in which Mr. E. M. Gibbs, F.R.I.B.A., was assessor, the object being to provide cottages which would let at 5s. per week clear without being in any way chargeable on the rates. Each house contains on the ground floor a living-room 14ft. by 11ft. 7ins., a scullery 8ft. 6ins. by 8ft., a pantry, coal-place and w.c. A concrete bath is provided in the scullery, between the sink and copper. On the first floor there is a front bedroom large enough for two beds, while at the back are two bedrooms, each large enough for one bed. A wardrobe cupboard is provided on the landing. Each house has a separate front garden and a separate yard. The approach to the yard is by a 5ft. wide back passage parallel to the road, which gives access to a space behind, 60ft. deep, reserved for gardens. Tarred-wood fences will be used to divide the whole of the gardens and yards. The houses will be built of local stock bricks with blue-brick bands, and the roofs slated. Casement windows will be used throughout, and the woodwork will probably be painted white. The estimated cost is £2,520, or £126 per house, the contractor being Mr. W. Malt-house, of Albany Road, and the architect Mr. H. L. Paterson, A.R.I.B.A., of St. James Street, Sheffield.

IRISH ARCHITECTS AND REGISTRATION.

WE notice that in its issue for July 15th the "Irish Builder and Engineer" devotes a leader to the position of the Registration Bill. Referring to the collapse at the recent Institute elections our contemporary says: "What in all probability occurred is that the registration leaders did not organize and discipline their forces to combat reaction, while on the other hand the personal appeal made by the 'old gang' produced an immense impression upon the younger men in London and its vicinity. There are, roughly speaking, about 1,400 members of the Institute resident in England, and of these considerably more than half practice in London and its vicinity; so that London alone has a substantial majority, if we exclude Ireland, Scotland and places abroad. London has never felt the pressure of the unfair competition of ignorant so-called architects, nor indeed do the architects of any great city in the same sense as

men in small country-places. Outside the Institute there is a great body of architects resident all over the provinces, Ireland and Scotland, mostly members of the various local institutes and societies, as well as the considerable membership of the Society of Architects, still practically unanimous in favour of registration.

The last election of Council has given the registration movement a most serious setback, which, nevertheless, cannot permanently affect the issue. . . . Meanwhile a question arises, How does Ireland stand? Ireland is in favour of registration, and we are convinced that a Bill promoted by the Irish Institute would receive the nearly unanimous support of the Irish members, for in no part of the whole empire is legislation more needed. Such a Bill ought to, and would be, received sympathetically by the British architects outside London. . . ."

Law Cases.

Estate Development: An Architect's Claim for Fees.—In the Liverpool County Court last week Mr. William Hesketh, an architect and surveyor, sued Mr. J. H. Taylor, a builder, for £100, the cost of preparing plans for the laying-out of certain land at Tuebrook, including roadmaking, &c., for its ultimate development for sale in building plots. The defendant had paid into court £20 in full satisfaction of the claim and costs. It was contended on behalf of the plaintiff, and evidence was called to prove, that the defendant had consulted him in

reference to the development of an estate which he had purchased adjoining Maiden Lane and Lisburn Lane, in Clubmoor, Liverpool, and the work now claimed for had been done at the request of the defendant between September and December, 1903. So far as the plaintiff had to do with it, the development scheme was stopped by the defendant in a letter in February, 1904, and the plaintiff subsequently learnt that the defendant had disposed of a considerable portion of the land. Defendant's case was that he had never ordered an estate plan, upon which a large portion of the claim was based, nor had it even been supplied to him. For what was known as "the cottage block plan" an ordinary price for a builder would not be more than two or three guineas; while plaintiff had admitted that for the purposes of the estate plan he had never surveyed the land, but had prepared it from the Ordnance Survey plan. Defendant had acquired the land, containing nearly thirty acres, in August, 1903, for £5,500, and having paid a deposit of £300, in May of last year he sold 6½ acres of it to the London and North-Western Railway Co. for £4,036, while he had subsequently disposed of two or three other plots for about £1,400. Thus, having regard to what he had already sold, he said, the remaining twenty acres or thereabouts which he now possessed had practically cost him nothing. Having heard further evidence, his Honour Judge Collier decided that £50 was ample to meet the plaintiff's claim, and he gave judgment for that amount, including the sum paid into court.

ACCEPTED DESIGN FOR WORKMEN'S DWELLINGS TO BE ERECTED BY THE SHEFFIELD CORPORATION AT WINCOBANK. H. L. PATERSON A.R.I.B.A., ARCHITECT.

FIRST FLOOR PLAN

0 5 10 15 20 25 30 FT.

COTTAGES AT PORT SUNLIGHT. T. TALIESIN REES, F.R.I.B.A., ARCHITECT.

These cottages are built of red bricks, with cement to the upper portion finished white, and the roofs tiled. The cost of the three was £800.

THE DECORATION OF WESTMINSTER CATHEDRAL.

WITHIN a short time the marble baldachino, with its eight massive columns, will be erected at Westminster Cathedral. It may be remembered that when the first set of these pillars arrived in England several were found to be broken; hence the delay with the work.

Another important feature to be dealt with almost immediately is the Cardinal Vaughan Chantry Chapel, which is situated near the opening of the Chapel of the Blessed Sacrament. Mgr. Dunn has this work in hand. The Byzantine arches, running the whole length of the chapel, are each to be divided by fine marble columns, the walls and roof will be embellished with marble and mosaics, and there will be a recumbent figure of the late Cardinal.

The Chapel of St. Paul is being collected for, and a fair amount of money has been received, but it is not expected that the work here will be commenced for some time.

In the baptistery the floor will shortly be paved in a very tasteful design in marbles, and similarly the other chapels lacking floor decoration.

The pulpit is to be moved against the great brick pier immediately in front of it, with the object of rendering the preacher more distinct in all parts of the vast building, and the base is to be taken away in front and replaced by short marble columns, which will give the whole a much lighter appearance.

The doors at the entrance should have been in position some time ago, and it will be a relief when they arrive, as the present makeshifts mar the beauty of the building as viewed from outside. They will be erected

as soon as the bronze-work is finished. It is not probable that the mosaic picture of "The Last Supper," which is to be placed over the entrance, will be commenced for many months.

When all the items named above have been completed and a few others have been added it is likely that there will be, for a time at least, a cessation in the work. There appears to be a feeling that although some progress should be made each year with it, the people of the present have built the cathedral, and those of the future should adorn it.

A new Roman Catholic Church has been erected at Normanton at a cost of £5,000. The building is in the Early Decorated Gothic style, and contains a nave 32ft. wide, aisles 6ft. wide, octagonal end, with chancel, side chapels, and vestries behind.

Edinburgh's Parliament Hall.—Much interest is being taken in the proposed restoration of the old Parliament Hall at Edinburgh. Mr. Oldrieve, architect, H.M. Board of Works, is in consultation with Sir James Guthrie, P.R.S.A., as to the tinting of the walls and the rearrangement of the pictures and statues. A new parquetry floor of oak and teak in. thick, set in panels, will be laid. The open oak roof is covered with many coats of varnish, and this is to be cleaned off to expose the old tone of the oak

HOUSE AT PRENTON. T. TALIESIN REES, F.R.I.B.A., ARCHITECT.

The building is of red Ruabon bricks and York stone, the upper portion being in cement-cast and half timbering, with tiled roof. The internal work, doors and fittings, are in white wood, finished with flat white paint, with the exception of the hall and dining-room, which are in English oak.

GROUND-FLOOR PLAN.

OLD LEAD TANK AT RICHMOND, SURREY.

This old lead tank is in the kitchen of the seventeenth-century house occupied by Mr. W. I. Chambers on Richmond Green. The house abounds with good things, noticeably the original carved gun-rack in the kitchen, the carved oak staircase with twisted rails and carved brackets, and a remarkable carved and perforated oak door in the hall. All rooms are panelled, and the bold external main cornice is a marvel of carving and preservation. Some of these old houses around the Green have fine moulded plaster ceilings, and the doorways and projecting hoods, mouldings and carvings provide a rich field of study for the student. By the crests on the tank it is generally supposed that the house was the residence of the Austrian ambassador of that date (1715).

Builders' Notes.

Durban Town Hall Contract.—The contract for the new town hall and public offices for Durban (illustrated in our issue for January 25th last) has been secured by Messrs. Cornelius & Hollis, a local firm. The estimated cost of the building is £237,945.

Property Values are stated to be somewhat on the down-grade in the City of London. A freehold purchased five years ago for nearly £8,000 has had to be sacrificed for a sum slightly in excess of £5,000. Experts are agreed that this is the day of huge blocks, and that the others will go steadily from bad to worse from the point of view of the owners.

The Cheap Cottages Exhibition at Letchworth (Garden City) is to be opened by the Duke of Devonshire at 4 p.m. on Tuesday next, July 25th. Those who wish to avail themselves of the special train leaving King's Cross for Letchworth at 2.25 are requested to inform the secretary (Mr. Wilbraham V. Cooper, 347, Birkbeck Bank Chambers, W.C.) of their intention.

Aspinall's Enamel, Ltd., have just successfully fought an action in Belgium against a firm who were selling goods bearing labels with the words "Email Aspinall," "Peinture Aspinall" and "Vernis Aspinall." The court awarded the English firm substantial damages, and ordered that all goods bearing the words "Aspinall" were to be withdrawn from the market.

Turpentine from Stumps of Pine Trees is being distilled in British Columbia. The lower parts of the trees are so full of the fluid that they are of no use for lumber, and by aid of stagings the upper parts are cut off above the turpentine section. An American company has put down a plant, and from single stumps is distilling as much as 75 gallons of turpentine, all of which is being sold in the Orient. When it is remembered that turpentine retails in Canada at from 90 cents to 1 dollar a gallon, it will be seen that the British Columbia enterprise is a valuable one.

The new patent Gas-Lime and Clinker Brickmaking Process is attracting some attention in Leeds. It is claimed that the bricks can be made at a lower cost and at the same time are of equal, if not of superior, quality to the ordinary building bricks. Messrs. W. Johnson & Sons, of the Castleton Foundry, Armley, have had contracts in hand for machinery for the manufacture of these bricks.

Lead Poisoning : Home Office Report.—A report by Dr. T. M. Legge, Medical Inspector of Factories, states that the existing special rules for processes in the manufacture of paints and colours, which have been in operation since 1892, are in need of revision; in particular it is pointed out that by far the greater number of cases of plumbism arise in occupations in which dust is raised in the mixing and grinding of white lead. This source of danger the existing rules do little to remove or diminish. The chief centres of the

paint and colour industry are East and South London, Liverpool, Glasgow, Hull, Manchester and Birmingham.

Labour in South Africa and Canada.—The Emigrants' Information Office, of 31, Broadway, Westminster, S.W., states that the building trade at Cape Town shows no signs of improvement, and at Port Elizabeth there is a good deal of distress owing to the depression. In Canada there has been good employment for skilled men in the building trade, the following having been especially busy:—Carpenters, bricklayers, masons, painters, paperhangers and stone-cutters, &c.

Competitions.

Rochester Technical Institute.—The assessor in this competition will be Mr. Frank T. Baggallay, F.R.I.B.A.

New City Hall, Perth.—The town council committee have agreed to allow an extension of a month for designs in this competition.

Branch Libraries at Cardiff.—In the announcement of this competition on p. 21 of our issue for last week an error occurs by the wrong insertion of a comma. The successful architects are Messrs. J. Allan Speir & Thomas A. Beavan, not "J. Allen, Speir & Beavan," as stated.

Scale of Charges for Assessing Competitions.—At the recent special meeting of the R.I.B.A. to consider amendments relating to competitions the following clause was adopted: "The usual R.I.B.A. scale of charges for assessing competitions is the sum of thirty guineas, plus one-fifth per cent. upon the estimated cost of the proposed building." Approval was given to the suggestion that assessors in making their awards be instructed to decide strictly according to the conditions of each competition.

TUBE STAIRCASES.

WE illustrate on this page a photograph of a portion of the air shaft of one of the staircases which is being erected for the Underground Electric Railways Co., Ltd. The contractors for this work are the St. Pancras Ironwork Co., of 171, St. Pancras Road, N.W., who have similar work on hand for the thirty or forty stations on the different tubes in London. The view shows the shaft being transported on one of the firm's steam wagons, of which we give detailed particulars on page xiii of our issue for March 8th last.

STAIRCASE AIR SHAFT FOR NEW TUBE RAILWAYS.

SOME PRACTICAL NOTES ON BRICKWORK.

By C. J. Wilson.

IN this article I propose to deal with brickwork in a modern building under the supervision of a clerk of works, himself a bricklayer.

We will assume that the concrete has been put in and levelled to the given height. First comes the setting-out of the building for the brickwork. This is done by squaring in off a given centre line or other point with the aid of a large wooden building square. If, as is often the case, by reason of some obstacle it is impossible to get the line down on the concrete, then it must be reproduced with the aid of a centre bob on to the bottom which has been prepared for the brickwork. Having done this, take distances or centres for the different walls, being very careful to make as many checks as possible.

Having set out the walls correctly, we can proceed with the building of them. Before any bricks are laid a level point should be produced down from the given datum, and a stout peg driven in, from which other levels must be produced to the principal points or corners of the building. Then make a gauge rod with every course carefully marked thereon, with the height of every template, window sill, door sill, stone heads, springing of arch, and height of floor on the particular wall on which work is to be commenced.

Laying.

Now the bricks can be laid. Have the concrete swept and damped, then start at either end of the wall and raise a corner to the height of the damp-course. If the wall is to be 2½-bricks thick, then the first course or footing will be 5-bricks thick. Care should be taken that the bricks are laid to what is now generally termed sectional bond, that is, the cross joint should continue in a straight line to the other side of the wall, thus obviating any straight joints in the centre of the wall. To my mind too much trouble cannot be taken in guarding against neglect of this, for on too many jobs the bond which looks so well on the outside is defective in the centre of the wall, where bats, pieces, compo and sometimes the scrapings of the scaffold are filled in. Another point which should not be overlooked is to see that the bricks are well damped, especially if cement and sand (technically called "compo") are being used; also see that the sand is clean and sharp, i.e., angular, and that the cement has been thoroughly air-slaked, otherwise it will swell slightly and angles will get out of plumb.

Care should be taken to see that the wall is thoroughly flushed up at every course, or, if this method of filling the joints is not approved, take care that the bricklayers put the cross joint through the whole length of the bricks on the outside, and that the middle of the wall is carried up. The compo and water is put in the middle of the wall to the required quantity and mixed to a proper consistency, after which the bricks are "swum" into their position, thus ensuring a joint all round the bricks, as well as a good solid job.

Another matter that requires attention is to see that the offsets on either side of the wall are kept regular, i.e., kept 2½ ins. each course—not 1½ ins. on one side and 3 ins. on the other, as often the case, with the result that there is not an equal distribution of the superincumbent weight over the whole of the footings.

The Damp-course.

Having levelled up to the damp-course, the asphalt is now put on. The work should be dry or the asphalt will not adhere to the brickwork, thus rendering the damp-course inefficient. If slates are to be used care should be taken that they are properly lapped and bedded solid, so as to prevent any breakage when the wall is built upon them.

Having laid the damp-course, proceed to set out the bond for piers and openings. All broken bond should be worked into the centre of the opening, so avoiding broken bond in the piers. Having set out the bond, care should be taken that the perpends are maintained correctly.

Arches.

We now arrive at the springing for the arches, which should be kept in a perfectly horizontal line. The centres are now fixed, and a watchful eye must be kept on the carpenter, or very likely it will be found that he has fixed them above the springing, or a trifle below, or else they are not quite level. If gauged arches are to be put in, great care must be taken in the setting-out, which should be entrusted only to a man who has had some experience of the work. It must be seen that the curve is struck from a proper point, also that all the bricks fit one to the other at extrados, intrados and face. If set in putty see that they are dipped so as to ensure a full joint on the face and soffit, and also a solid joint in the body of the brick, otherwise the weight superimposed on the arch will cause it to crack. The same remarks apply to rough-axed arches, only that it is best to joggle these, thus ensuring a solid body; rough arches, too, should always be joggled, that is, a small piece cut off the frog of the brick to form a channel into which cement-grout can be poured, finding its way all round the brick and ensuring a solid job.

A word as to

Chimney Flues.

See that these are well pargetted and free from all rough surfaces, for the slightest rough place where the smoke can hit will often cause a smoky chimney. Look also to the gatherings and see that they are cut in a proper manner—see there are no cripples. Take care that all the angles of the flues are smoothly rounded. Do not tolerate sharp corners or rough surfaces. After they have been built to the required height have them all very carefully cored with a set of drain rods. Where the chimney-breast passes between the thickness of the various floors it should be rendered on the outside ¾ in. thick with lime and hair mortar.

A few words as to

Glazed Work.

See that all the joints, both bed and cross-joints, are of an even thickness throughout, for nothing looks worse than one thick and two or three tight joints: not only is it a sign of bad workmanship, but where bricks are laid practically dry the arrises will frequently flush.

Finally, keep the whole of the building levelled up all round. Avoid toothings or indents, for they are frequently the cause of rupture—due, it is almost always said, to unequal settlement, but in most cases to the wall not being properly built at the intersection of the toothing or indent; nine times out of ten the joints, both bed and cross-joints, are not filled in solid, and often the proper bond (2½ ins.) is not left. Moreover, by keeping the building level over the whole site unequal settlement is avoided.

Bricks should be well damped, and compo mixed as used; none should be left overnight. Whenever a fresh scaffold is started have the wall well swept and damped before building, and in winter-time keep all walls carefully covered over till ready to work on them again.

Liverpool Dock Offices.—Referring to the article on this building in our issue for July 5th, a correspondent points out that the four corner towers are each 143ft. high, two of them being built in grey granite from ground to first floor. The description given implied that the two latter only were 143ft. high.

CONCRETE FENCE-POSTS.

IN a paper read by Mr. J. A. Mitchell before the Association of Cement-Users at Indianapolis, U.S.A., the following interesting particulars are given of the manufacture of concrete fence-posts. Both the dry and the wet (or slush) mixture may be used, but the former is the better. The proportion of cement to sand may be 1 to 3, 1 to 4 and even 1 to 5. Mr. Mitchell states that he tried 1 of sand to 1 of cement, but the result was an entire failure. It is almost impossible to make a good post without some form of reinforcement; and although wood has been tried, metal has been found to be the only really practicable material to use. Holes should not be put through the posts as a means of fastening the fence to them, as the holes weaken the posts and also take too long to make. Hooks and staples, and eyes made of wire embedded in the posts have been tried; but the best form of fastener is said to be one that fixes the fence and post rigidly together. There are various ways of doing this, depending on circumstances. For constructing the posts wooden moulds, being cheap, light and easily made, are the best. They should be collapsible, so that the post can be removed from them in twenty-four to forty-eight hours after making. These moulds, if cared for, will last several years.

Cost.

Posts made in the manner above described cost about 12 cents (about 6d.) each, the size being that required for ordinary railway fencing. This cost is based on the assumption that cement costs 1.50 dollars (6s. 3d.) per barrel, gravel 40 cents (1s. 8d.) per cub. yd., metal 2½ cents (1½d.) per lb., and labour 1.50 dollars (6s. 3d.) per day. Two men can make 175 to 200 posts per day. It is stated by Mr. Mitchell that these concrete posts will stand freezing without harm, and that hot weather has no injurious effect upon them. Mr. Mitchell says that he has been able, by making the posts tapered, to effect a very considerable saving in the quantity of concrete used, compared with the amount required for parallel posts of the same length and of the same size at the bottom as the parallel posts. Assuming the posts to be 6 ins. square, and allowing an area of iron reinforcement of 1 per cent. of the area of the cross-section of the post, the area of iron required would be 0.36 sq. in. If this reinforcement were arranged in the form of twelve rods, each ⅜ in. in diameter, it would represent closely the required area, and the rods could be placed four along each side at a depth of ¾ in. to 1 in. from the surface of the post.

OUR PLATES.

THE libraries are among the finest buildings of the United States, and the example given in our plate is very typical of the style in which they are built. It will be seen that classic lines are closely followed and that a special effort is made to gain a monumental effect. Sculpture, too, is employed, as over the windows in this library at Pawtucket. The building masses up well, and is refined in feeling, as one would expect from such well-known architects as Messrs. Cram, Goodhue & Ferguson; but the strict following of Greek precedent in the employment of the antefixæ hardly produces a happy skyline for the cornice.

The tennis and racquet club at Boston is a good example of brickwork in America. The treatment was a difficult one, but the architects have been very successful in the arrangement of the unbroken wall-space, relieved by sunk panels in the brickwork and enlivened by the stone string-courses. The windows below the cornice are also a relief.

Correspondence.

A Suggested Improvement to the Marble Arch.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—While thanking you for the kind support given to this movement in your issue for July 5th, I desire to reply to one or two of the objections which you raise. First, you state that the appearance of the Marble Arch, coming through the Park, would not be greatly improved. I am well aware of this fact, but the only hope of my scheme being carried out was to suggest only such alterations as could be made at a nominal expense, and therefore I purposely refrained from attempting to interfere with the valuable property on the other side of Oxford Street. Secondly, you refer to a new processional road from Constitutional Hill and the Mall. I did not suggest this. The road through Hyde Park as already existing was what I referred to; its weakness, however, in present circumstances is that it has no dignified finish. Thirdly, you state, that "the plan for bringing a screen across Park Lane is also open to objection because it would force the main traffic road to be swung round sharply at the Oxford Street end, which is anything but desirable." May I point out, with reference to this remark, that the bulk of the traffic at present using Park Lane has to turn round on its way to and from Edgware Road at right angles at the Oxford Street corner. My plan would obviate this, and would enable the traffic going to Edgware Road to take a much easier turn. Fourthly, you are labouring under a misunderstanding with reference to the suggested Venetian mast lamp-posts. If you will refer to the "bird's-eye view," you will observe that the lamps are placed at the usual height of an electric standard, namely, 25ft.—the upper portion of the lamp-post being, in fact, a Venetian mast for the purpose of flying pendant flags on festive occasions.—Yours truly,

LONDON, W. F. W. SPEIGHT.

[(1) The expense of interfering with the property in Oxford Street was one of the reasons for our suggestion to move the Marble Arch in front of Edgware Road. (2) We used the word "new" to convey that the present road could not be considered a processional one. (3) In Mr. Speight's plan the traffic would be more directly delivered to Great Cumberland Place and Edgware Road, but if he will refer to a recent paper by Mr. John W. Simpson on "The Planning of Cities and Public Spaces" read before the Royal Institute of British Architects, and published in its "Journal," he will see that this gives more points of collision than the present arrangement. Mr. Speight's plan is also not convenient for the very considerable traffic to and from Oxford Street and Park Lane. (4) We raised an objection to the usual height electric street lamps are placed above the ground. We think the proper height should be about that of ordinary gas lamps, so as to afford better lighting, to prevent the dwarfing of surroundings, and to avoid a spidery proportion.—Ed. B.J.]

A Recreation Club for Architectural Students.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—It has often occurred to me that there is a lack of encouragement for recreation among architectural draughtsmen. Through your columns one might get in touch with most of the profession in London, and it might be possible to take soundings as to what the general opinion is as to an architectural club run on economical lines.—Yours truly,

W. GORDON.

91, RINGSTEAD ROAD, CATFORD.

[If we can be of any service to readers in this respect we shall be glad.—Ed. B.J.]

RESTORATIONS AND IMPROVEMENTS AT OXFORD.

IT is customary for the Oxford Architectural and Historical Society to place on record in their annual report any restorations or new building operations of importance that have taken place in the city. This year's report points out that the most striking of these improvements is the completion of the work at St. Michael's Church. The open space on the north side of the tower, obtained by pulling down the houses which formerly were built against it, has been laid out with shrubs, and a wrought-iron railing and gates have been erected to shut off the churchyard from the street, access being thus provided to the north door of the church. The old work has been carefully handled, and the whole constitutes an obvious improvement, which sets off the tower to great advantage.

Various alterations have been made at St. Ebbe's Church. The old upper storey of the tower has been repaired and the tower raised by the addition of another stage. Two windows have been inserted in the west wall of the nave and a western doorway formed underneath them by the opening of an arch formerly walled-up. The greater part of the remains of an old Norman doorway which stood outside the south wall of the church has been used to form this doorway, and a part of the old arch has been set up against the west wall of the church.

Work at the Colleges.

The new buildings at Merton College are rising rapidly, and the college also contemplates a new warden's house on the opposite side of Merton Street.

Magdalen College is building a block of houses in King Street opposite the quadrangle of the New Examination Schools, and the work is well advanced.

At New College the additions and improvements to the warden's house are now completed.

Mention must be made of the completion of the restoration work in the hall of University College. The old plaster ceiling is now a thing of the past. The hammer-beam roof discovered some time ago above it has been almost entirely renovated on the old lines and a new lantern added, in the centre. New oak panelling has been placed around the walls, a large carved oak chimney-piece has been added, and stained-glass inserted in the west and two of the side windows. These alterations, combined with the previous lengthening of the hall, have created a striking interior.

At Exeter College the old oak panelling in the hall, and also the fine oak screen, have been taken down, cleaned and restored to their place with slight alteration, and two new oak mantelpieces have been erected.

The Society's report mentions that the tomb of Thomas Hearne, the antiquary, is to be restored. The old stonework forming the base of the tomb will be re-set and the decayed parts renewed. A new inscription slab will be procured, similar in design to the old one (this latter being too far perished to be used again), and the old inscription cut on it. The old slab will be preserved.

Another Alpine Tunnel.—The French have been considering for a long time how they shall avert the losses with which they are threatened by the Simplon tunnel and its projected feeders. The French Minister of Public Works now proposes to lay a direct line from Lons-le-Launier, tunnelling the Col de la Faucille, and to continue this line under Mont-Blanc to Courmayeur, and thence down the valley to Aosta, whence it is easy to reach Turin, Milan, Piacenza and the overland route to Brindisi and the east. The estimated cost is 115,000,000 francs.

Keystones.

A Public Hall and Library at Hatton has been erected at a cost of £859. Mr. W. Davidson, of Ellon, was the architect.

The Shakespeare Memorial in London is to be an architectural one, including a statue. An open competition for the design is to be held.

Balavil House, Badenoch, Scotland, is being reconstructed under the direction of Messrs. McGibbon & Ross, 65, Frederick Street, Edinburgh.

The restoration of Old Abbey, Coupar Angus, is being carried out. For many years the ruins have lain covered up with earth and stones. Carved stones are now coming into view.

The Chancel and Morning Chapel of St. Peter's, Hornsey, have been completed. The building, which is from designs by the late Mr. James Brooks, cost, with the site and vicarage, £16,000.

Buckingham Parish Church has recently had two buttresses added to the tower. The rebuilding of the west door and the placing of five ornamental stone windows in the tower have also been carried out.

The Church of St. Catherine, Danzig, dating from the thirteenth century and one of the finest specimens of early Gothic in Germany, has been struck by lightning and completely burned down.

The Metropolitan and City Police Orphanage at Strawberry Hill has had a new wing added at a cost of £7,300. It includes a dormitory, dining-hall, gymnasium, band and art rooms, and kitchen, &c.

A Workmen's Club has been erected at Seaton Delaval at a cost of £4,000. The contract was carried out by Mr. N. Ritchie, of Whitley Bay, from the plans of Mr. J. T. Alexander, architect, of North Shields.

Yarrow Old Church is to be restored. It was built about the year 1640. Though the walls are sound the interior will require careful attention. The galleries are to be cleared out and an apse is to be constructed.

A Police-station and Court-house at Thorne has been erected at a cost of £2,000. The plans were prepared by Mr. Vickers Edwards, architect to the Yorkshire County Council, Wakefield, and the contractor was Mr. W. Barton, of Thorne.

Temporary Schools.—The Board of Education has agreed that in districts with a liability to subsidence, where the population depends on a fluctuating industry, and where small schools are desirable owing to a sparse population, buildings may be erected of galvanized iron, lined with boards and with a layer of felt between the outer and inner coverings.

The new Wesleyan Church and Schools at Saltburn have been completed. The buildings, which cost £7,000, are in the late Gothic style, the exterior being of stone from Pateley Bridge. The nave, aisles, chancel and organ-chamber, with pillars and arches, are in Whitby stone, and the roofs are covered with red tiles. Internally the whole of the woodwork is in pitch-pine. The contractors were Messrs. T. Dickinson & Son, of Saltburn and West Hartlepool, while the architects were Messrs. Garside & Pennington, of Castleford and Pontefract.

Lord Rosebery recently opened a loan exhibition of relics and treasures in the town hall, Aylesbury, organized for the purpose of celebrating the jubilee of the Bucks Architectural and Archaeological Society, of which he is president. The exhibits included mementos of well-known Buckinghamshire men and others, typical specimens of Bucks fauna, flora and geology, prehistoric and mediæval antiquities, old

silver and metal work (including church plate), examples of Bucks industries, pictures, and photographs.

Architectural Refinements.—The Edinburgh Town Council have given £10 to the autumn exhibition of the Edinburgh Architectural Association.

The North Bridge, Edinburgh.—At last it has been decided to place statuettes on the pedestals of the North Bridge, Edinburgh, which have remained vacant since the bridge was completed some years ago.

Rumoured Dangerous Condition of the Alhambra.—Reports from Granada speak of a threatened collapse at the Alhambra by reason of the undermining of the hill on which it stands by the rapid waters of the Darro. A proposal is on foot to divert the course of the river.

Vandalism in Greece.—The picturesque walls of Chalkis are being ruthlessly destroyed, and thus one of the most beautiful towns of Greece, and one of the few which has hitherto preserved its romantic mediæval appearance, is being reduced to a dull level of modern "culture."

A Dorsetshire Church.—The chancel and north transept, together with a temporary brick nave, of the new church of St. Osmund at Parkstone have been completed from designs by Mr. G. A. Bligh Livesay, F.R.I.B.A. The building is of terra-cotta, supplied by Messrs. Carter & Co., of Poole.

A Congress on Heating and Ventilation is being held this month at Hamburg. A special issue of the "Gesundheits-Ingenieur" gives a series of articles on certain of the more important branches of the science, among which is a very full account, with numerous illustrations, of the heating, ventilation and hot-water supply of the Grand Hotel at St. Moritz.

Edinburgh Architectural Association.—The annual excursion this year has been made at Dunkeld, where, after visiting the cathedral, the visitors inspected Murthly Castle, an unfinished Jacobean edifice of great size. Stobhall was afterwards visited, Mr. George T. Ewing, architect, acting as leader over this picturesque group of buildings, which consist of castle, chapel, priest's house and dowry house.

A new Chain-testing House at Cradley Heath has been erected by Messrs. Lloyds British Testing Co. at a cost of £20,000. The general block is a huge room 200ft. by 75ft. wide and 25ft. high, containing two machines—a tensile of 100 tons, and an anchor and breaking machine of 150 tons. The whole structure has been built by Messrs. J. & A. Brazier, of Bromsgrove, from Mr. Clarence A. Bloomer's designs.

The new Wards added to Newcastle Workhouse have been completed at a cost of £18,000. The accommodation is for 127 aged and infirm men and 153 aged and infirm women. The building work has been carried out by Mr. Thomas Weatheritt, the heating and engineering by Messrs. Emley & Sons, and the electric lighting by Mr. S. H. Gowdy—all of Newcastle. Messrs. Newcombe & Newcombe, of Newcastle, were the architects.

Alterations to St. Andrew's Halls, Glasgow.—It appears that these halls, the masterpiece of Sellars, are to be reconstructed internally, so as to increase the accommodation, at a cost of about £18,000. The plans have been prepared by, and are to be carried out under the superintendence of, the city engineer. Two large columns which interfered with the view of a few in the back gallery are to be removed, and the span bridged without support. The firm of the architect who designed the building (Messrs. Campbell Douglas & Sellars) have not been consulted in the matter.

The Restoration of Iona Cathedral has now advanced so far as to allow Divine service to be conducted in the choir.

Pontefract Workhouse has been extended at a cost of £15,000. Mr. A. Hartley, of Castleford, was the architect.

Durham Cathedral Organ has been thoroughly re-modelled by Messrs. Harrison & Harrison, organ builders, of Durham.

A Bronze Statue of Lord Tennyson, modelled by the late Mr. G. F. Watts, R.A., has been placed at the north-east corner of the Cathedral Green, Lincoln. The statue, which is 11ft. 8ins. high, stands on a marble pedestal.

Carnegie Library, Wombwell, Barnsley.—The architect of this building is Mr. A. B. Linford, of Wombwell, not Mr. H. L. Paterson, as stated on p. 21 of our issue for last week. Mr. Paterson was the assessor in the competition that was held.

Saltburn-by-the-Sea Wesleyan Church and Schools.—These buildings have just been completed, at a cost of over £7,000, from designs by Messrs. Garside & Pennington, architects, of Pontefract and Castleford. The church is divided into nave, aisles, chancel and organ-chamber, with pillars and arches in Whitby stone. Externally the stone is from Pateley Bridge, with hand-made red tiles on the roof. The contractors for the work were Messrs. T. Dickinson & Son, of Saltburn and West Hartlepool, the electric light having been installed by Messrs. Hind & Son, of Stockton, and the lead lights executed by Messrs. Stephenson, of Lancaster.

The old Gothic Church of Blythburgh, built in 1460, has for years past gradually become more and more dangerous through want of funds to keep the fine painted roof, the porch, &c., in proper repair. An influential committee has now been formed, under the immediate patronage of the Princess Louise, consisting of Sir Ralph Blois, Sir Caspar Purdon Clarke, Sir Ernest Waterloo, R.A., Mr. Seymour Lucas, R.A., Mr. Crofts, R.A., Mr. C. F. Egerton, the Bishop of Norwich, the Archdeacon of Suffolk, and others, and an art exhibition is to be held at Cockfield Hall on August 5th, when it is hoped to raise sufficient funds to preserve the work, for which the sum of £3,000 is needed.

Rebuilding a Goods Station.—The London and North-Western Railway Co. are now rebuilding their Haydon Square goods station, the work being in the hands of Messrs. Kirk & Randall. The basement is intended as a bonded store for wines and spirits. On the ground floor there will be loading decks at which it will be practicable to accommodate ninety lorries or carts, and by means of three lifts wagons may be conveyed from or to the rails on the viaduct level above, each lift to be capable of transferring wagons at the average rate of forty an hour. The rest of the ground floor will be roofed, for loading and unloading under cover. The building will be constructed of concrete. Patent glazing and steel bars encased with lead to prevent rusting will be used for the roofing, and stanchions and girders will be protected by fire-resisting material. The new station is designed to admit of the building above it of a warehouse of four floors with a total area of 18,500 sq. yds.

Dawpool School, Thurstaston, Cheshire, is being erected from designs by Mr. J. Francis Doyle, architect, of Liverpool. Accommodation will be provided for 104 scholars, with schoolmaster's house attached. The walls are faced externally in red bricks, with terra-cotta dressings and red-tiled roof. The whole of the school building has a deep dado of cream-glazed bricks, with plinth and band of light red, thus adding materially to the cleanliness and sanitary condition of the building.

At the Ruins of Linlithgow Palace lavatories are to be erected for the use of visitors.

A new Wesleyan Church at Ford, Devonport, is being built at an estimated cost of £5,600. The architect is Mr. H. J. Snell, of Plymouth, and the contractors are Messrs. A. R. Lethbridge & Son, also of Plymouth; Mr. R. Dark acting as clerk of the works.

Sheffield Society of Architects and Surveyors.—The eighteenth annual report, for 1904-5, gives the present membership as 120, while the accounts show a balance in the bank of £33. The report refers to the resolution of the council on July 15th last that it was desirable for each allied society to be represented every year on the council of the R.I.B.A., and states that in response to the request made for co-operation thirteen societies have expressed concurrence therewith. The matter will be brought before the R.I.B.A. for consideration.

New Sunday Schools, &c., for the Baptist Tabernacle, Southport, are being erected. The main schoolroom is 53ft. by 32ft. In addition there are twelve other classrooms, an infants' classroom 25ft. by 14ft., kitchen, large minister's vestry, lecture-hall 36ft. by 25ft., lavatory accommodation and library. Mr. Francis P. Halsall, A.R.I.B.A., of Southport, is the architect, and Messrs. Duxfield Brothers are the builders. The cost, exclusive of site, will be about £2,500. The elevations are being carried out in pressed bricks and grey terra-cotta from Mr. Jabez Thompson's works at Northwich.

Obituary.

Mr. William Dawson, builder, Macduff, died recently. Amongst the undertakings with which he was connected was the widening of Banff Bridge, about twenty years ago, the erection of the town hall and municipal buildings, and the contract for the Macduff sewage works.

Mr. C. F. Hayward, F.R.I.B.A., F.S.A., of Lingfield, died recently in his seventy-fifth year. He was district surveyor for Bloomsbury, Soho and Covent Garden. Among the buildings in London erected from his designs are Messrs. Lambert & Butler's tobacco factory in Drury Lane and Great Wild Street, and houses in Mayfair.

New Companies.

PROVANHALL BRICK CO., LTD., 95, Bath Street, Glasgow. Capital: £5,000.
GREAT NORTHERN CARTAGE CO., Tottenham Lane, Hornsey, N. Capital: £5,000.

STONE DAM ESTATE CO., LTD., builders, contractors, &c., Halifax, Bradford and Rcthwel. Capital: £1,000.
RAPIDAL PAINT CO., LTD., paint and varnish manufacturers, Wellington Road, East Ham. Capital: £2,000.
PETER FORD & SONS, LTD., manufacturers of plaster of Paris, cement, whitening, &c., Uttoxeter, Fould, Stanton, and Alton, Staffs.
BYWATER & SONS, LTD., builders, decorators, contractors, &c., 10 King Street, Regent Street, W. Capital: £50,000.
CROWN HILL BRICK AND TILE CO., LTD., to take over the business carried on by G. H. Tranfield at Shenley and Stantonbury, Bucks. Capital: £2,000.
GEORGE INGHAM MUIRHEAD CO., LTD., builders, timber merchants, engineers and general smiths, Newport and Madeley, Salop. Capital: £10,000.
DONALD BLACK AND CO., LTD., contractors and builders' merchants, Station Road, New Barnet, N. Capital: £5,000.
WILLIAM SHAW AND SONS, LTD., coal and lime merchants, Longwood and Gledholt and Scarwood-in-Golcar, near Huddersfield. Capital: £10,000.
LIVERPOOL HENNEBQUE FERRO-CONCRETE CONTRACTING CO., LTD., 22A, Slate Insurance Buildings, Street, Liverpool. Capital: £40,000.

THE ARRANGEMENT OF DRAWINGS.

By Alfred T. Best, A.M.I.C.E.

AS a plan may be made or marred by its arrangement, and beginners are often at a loss how to proceed, it is hoped that the following hints may be found useful.

Size of Paper.

Before commencing to plot or design take the over-all dimensions of what is to be drawn, determine a suitable scale, and find the over-all dimensions reduced to that scale. Thus, an estate 300yds. long, if the survey be plotted to a scale of 40ft. to 1in., will measure on the paper 22½ins. A bridge of 100ft. span to ¼in. scale, with approaches, will cover nearly 30ins., and its cross-section, say, 6ins.; total, 36ins. Add from 2ins. to 6ins. or 8ins. for margins, and this will give an approximate idea of the paper required. Take the nearest size in use, say a sheet of Imperial, 31 by 22, or Double Elephant, 40 by 27. Plans of this size should be rolled or stored flat. Smaller plans may be folded, to file with other documents, and for this reason should be made, say, of foolscap size (or quarto or any other standard unit) or multiples of it: thus, 12½ by 8, 16 by 12½, &c. If there are to be several drawings relating to the same work, endeavour to keep them uniform; avoid odd and irregular sizes.

Placing on Paper.

Find the centre of the paper by measurement or diagonals. From this centre mark off to left and right approximately one-half the over-all length. Similarly mark the top and bottom by taking one-half the over-all width or height, but measure from a point rather below the centre so as to leave for the title, &c., more margin above than below. But it generally happens that a drawing comprises several distinct parts, the different views necessary for complete illustration of the object being placed on a single sheet. If these component elements be numerous or complicated, it is a good plan to find their approximate sizes and to cut out of paper a rough outline of each part. Then by a little manipulation these can be disposed to the best advantage and the various drawings placed on the paper accordingly. But as a rule this can be done easily enough by mental calculation, or at most with the aid of a rough dimensioned sketch first jotted down on scrap paper. Unless some preliminary thought be given to these questions the result may be a plan looking ridiculously small and lost in the corner of an acre of blank; or, on the other hand, the plan when half plotted may be found to "walk off" the paper on to the drawing board. This is much more vexatious; therefore err on the side of excess of space; paper is cheap and "time is money." For machine drawings, symmetrical architecture, &c., commence with centre lines.

Projection.

The correct principles of projection are very commonly disregarded, which is much to be regretted, for the result of such neglect is a great loss of clearness. Fig. 1 shows a drawing which is faulty in this respect, as an example of how not to do it. Here the plan and section are placed without any relation to one another, and the section has to be mentally twisted round to bring it into relation with the plan. The plan should be placed under the section or elevation, and should face the same way, so that vertical lines connect point to point. If the plan be drawn first, lines are projected from it to form a basis for the elevation; then from the elevation lines are run horizontally to an end elevation or section. In order to get a rational idea of what is right and why it should be so, if the obvious extra facility in designing and understanding the drawing be not sufficient proof, fold (or imagine) a sheet of paper forming three sides of a box,

inside which stands the article or building to be drawn, or a model of it. Take, for example, as shown by Fig. 2, a very simple object like a common brick (the principles are the same whether applied to a palace or a drain pipe); then vertical lines dropped down to the horizontal plane mark out the plan; horizontal lines carried back to the vertical plane show the front elevation; horizontal lines at right angles to these last, carried along to the other vertical plane,

show the end elevation. Removing the brick or other model, real or imaginary, and "developing" (unfolding) the paper, it appears as in Fig. 3, or, by an alternative development, as in Fig. 4. Or consider the paper to be transparent and folded to lie horizontally over and vertically in front of the object, as in Fig. 5. By vertical and horizontal rays mark out the plan as seen from above, the elevation as seen from in front, &c. The paper unfolded is as Fig. 6.

FIG. 1.—FAULTY ARRANGEMENT. FIGS. 2, 3, AND 4.—VIEWS OF A BRICK, OBTAINED BY PROJECTION. FIGS. 5 AND 6.—ALTERNATIVE METHOD OF PROJECTION. FIGS. 7 AND 8.—SPECIMEN DRAWINGS PROPERLY ARRANGED.

Electrical Notes.

Electro-technical Laboratories.

New electro-technical laboratories at Liverpool University have been built at a cost of £12,000 from designs by Messrs. Willink & Thicknesse, the builders being Messrs. William Thornton & Sons, and the electrical fittings having been supplied by Messrs. John Hunter & Co., all of Liverpool. The basement is occupied by rooms intended for experiments with heavy machinery, and by rooms set apart for electrical measurements of various kinds and for purposes of research. The dynamo-room is 56ft. by 60ft. and is divided into three bays, one intended for testing direct-current machinery and one for work with alternating currents, while the third contains a two-cylinder Westinghouse gas-engine coupled to a dynamo which can be used for lighting the whole block of the new buildings, and also a tramcar body with complete electrical equipment. There are, in addition, dynamos and motors of various types, and several machines lent for experimental work, the owners of which are supplied with the results obtained. Adjacent is a workshop fitted with electrically-driven tools, and a senior students' laboratory 34ft. by 28ft., equipped for alternating-current testing. The laboratories in the front of the basement include one measuring 35ft. by 13ft., fitted with appliances for producing high electrical pressures by which "break-down" tests on insulating materials, such as are used in the manufacture of high-tension cables, may be carried out; another containing apparatus for investigating the magnetic qualities of iron and steel; and a third provided with a photometric bench. Two large rooms, 20ft. by 27ft., are intended for general research; one at present contains a high-frequency

oscillograph, but the other, to be devoted to electro-chemical work, is as yet without equipment. The same lack of equipment is apparent, though in a less degree, in four other rooms, of which one contains accumulators for research work only, another being intended for "life" tests on electric lamps, the third for testing meters, and the fourth to hold standard instruments, which will be regularly compared with the standards at the National Physical Laboratory. On the ground floor are arranged laboratories for less advanced work, together with a professor's room and private research laboratory, while on the first floor there is a lecture-room with seats for 130 students, the table of which can be connected with any machine in the dynamo-room, together with smaller class and demonstration rooms and a reading-room and library.

Electric Power for Scotch Factories.

The Clyde Valley Electrical Power Co. of Glasgow have opened a power station at Yoker, near Glasgow, to supply electrical energy at the lowest rates for manufacturing purposes. The area which it can now deal with covers 750 miles, and contains the chief centres of iron, steel and coal production, and the Clyde shipbuilding yards. The company's plant will be available night and day, and as it can furnish power at a price which would be impossible for any private installation to attain, it will open up great possibilities for trade extension in the Clyde valley, and will, it is hoped, enable the smaller home manufacturers to compete the better with foreign rivals.

A Sample Cabinet.

The Simplex Steel Conduit Co., Ltd., of Westinghouse Building, Norfolk Street, Strand, London, W.C., send us particulars of a novel sample cabinet which they have prepared with the idea of supplying on loan to station engineers, architects, lecturers, &c., a

set of samples of their various conduits and fittings. There are four trays, so that the samples can be classified into main groups, and as each tray is subdivided the groups can be further arranged in sections.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

DURING THE WEEK ending July 14th twenty-two failures in the building and timber trades in England and Wales were gazetted.

S. SMITH, plumber, Mansfield. R.O. July 4th.
R. STEWART, builder, Hatfield Woodhouse. R.O. July 6th.

J. JONES, carpenter, Dowlais. R.O. July 4th. P.E., Merthyr Tydfil Town Hall, July 26th, at 3.

W. N. RICHARDSON, painter, decorator, &c., Leire. P.E., the Castle, Leicester, Aug. 1st, at 10.

W. S. GOODSON, builder and joiner, Eastcote, near Pinner. Adj. July 5th.

F. HODGES, builder, Isleworth and Ealing. R.O. July 7th.

W. J. MORSE, varnish manufacturer, Shoreditch. P.E., London Bankruptcy Court, Aug. 4th, at 12.

A. BRUSH, builder, Woodford Green (late Chigwell). P.E., London Bankruptcy Court, Aug. 9th, at 11.

J. CAMPBELL CREE, builder, late of East Ham. Adj. July 14th.

WITT BROTHERS, builders, Bitterne. R.O. July 8th. First meeting, O.R.'s, Southampton, July 19th, at 3.30. P.E., Southampton C.C., July 26th, at 12.

T. ROGERS, plumbers' and painters' merchants, Urmston and Manchester. First meeting, O.R.'s, Manchester, July 19th, at 3.30. P.E., Manchester C.C., Aug. 21st, at 10.

W. BELCHER, brick merchant, Bayswater Road, London, W. Gross liabilities £57,010; £7,306 unsecured; estimated surplus in assets £918.

W. THEOBALDS, architect and surveyor, 26, Budge Row, E.C. P.E., London Bankruptcy Court, Aug. 8th, at 11.

W. LEE, builder, Ashford (late Kenley). R.O. July 4th. First meeting, 24, Railway Approach, London Bridge, July 21st, at 11.30. P.E., Croydon C.C., Aug. 16th, at 11.

J. THOMSON, builder, Leeds. R.O. July 5th. First meeting, O.R.'s, Leeds, July 19th, at 12. P.E., Leeds C.C., July 31st, at 11.

P. G. WALLER, builders' ironmonger, Pontefract and Purston. R.O. July 6th. First meeting, O.R.'s Wakefield, July 19th, at 11. P.E., Wakefield C.C., Aug. 3rd, at 11.

The Edison & Swan United Electric Light Company, Limited,

36 & 37, QUEEN STREET, CHEAPSIDE, LONDON, E.C.

And at Birmingham, Belfast, Dublin, Cardiff, Dundee, Glasgow, Hull, Leeds, Liverpool, Manchester, Newcastle-on-Tyne, Sydney, N.S.W.

G. 3756.

Yellow Opalescent or Flint with Green Blobs, Satin Finish and finely Etched.

G. 3561.

Yellow Opalescent or Flint with Green Blobs, Satin Finish and finely Etched.

G. 3781.

Yellow and Pink Opalescent or Flint Finish.

G. 3771.

"Ediswan"
Shades for . . .
Electric Light Fittings.

others of more delicate workmanship. This monastery contains a fine bell tower of the Romanesque style and a few portions of Renaissance work. Jumilhac-le-Grand possesses a château with a beautiful chapel. St. Jean de Cole and Bussières-Dadil both contain good churches. At Angoulême the domed cathedral is one of the best examples of French Romanesque work. In the vicinity of Angoulême are the churches of Trois Palis and Bassac, and the magnificent château de la Rochefoucauld. Proceeding from Angoulême in the direction of Bordeaux, the towns of Plassac, Montheiers and Chalais, which possess fine churches, should be visited. At Charmaute is a fine priory and at La Couronne are the ruins of a splendid Gothic abbey. When at Angoulême, if time permits, a trip should be taken to Saintes and Cognac, both of which places are full of splendid examples of architecture of all periods.

H. M.

Board of Education Examination in Architecture.

SIDMOUTH, DEVON.—DOWN SOUTH writes: "Please inform me what the word 'architecture' embodies in the South Kensington examinations, stage III. (Building Construction). In this year's papers the instructions before the questions in the honours paper state: 'No candidate will be credited with a success in this examination who has not obtained a previous success in stage III. or honours of the same subject, and who does not qualify in the Board's examination in architecture.' In previous years the examination in the history of architecture was taken in the honours paper, and the final was an examination in design. Are these two subjects now combined? Can you tell me in what month the final examination is held?"

The syllabus in architecture is published in the Board of Education "Syllabuses and Lists of Apparatus applicable to Schools and Classes other than Elementary," p. 198. The sections are: (1) Influence of materials, &c., study of details; (2) the Greek and Roman Orders; (3) Influence of constructive necessity in developing later styles; (4) characteristics of English architecture; (5) description of buildings; (6) terms in ordinary use. The examination for this is distinct from the examination in building construction. The honours examination in practical designing is still continued, and the notices have already gone out for this year to those candidates who are eligible.

HENRY ADAMS.

The Architectural Societies.

HORLEY.—B. S. writes: "Is there any way of becoming a member of any architectural society without taking the preliminary examinations if the applicant is in a practice

as an architect and therefore has not time to give to them?"

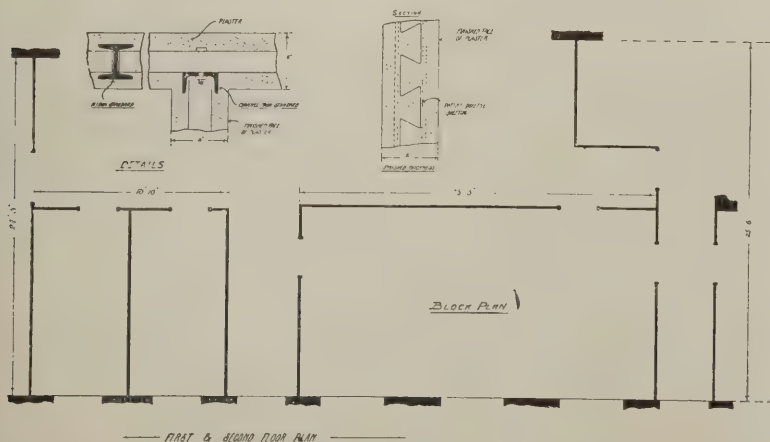

None that give degrees. You can join the Architectural Association without passing an examination.

Buildings to Measure near Barrow and Harrogate.

Referring to the replies as to buildings to measure near Barrow and Harrogate in our issue for last week, Mr. H. E. Illingworth, A.R.I.B.A., of Leeds, writes: "With regard to Barrow, Furness Abbey is certainly worth a visit and careful study, but the red sandstone of which it is built is not very well preserved, and it would not be very easy to get the exact mouldings. Far more suitable for your correspondent is Cartmel Priory (Grange station). (Tickets almost always allow a break of the journey here, as well as Furness Abbey.) It contains all styles from Transitional Norman; the east window (Perpendicular) is one of the finest in England; inside the building are very fine choir stalls well worth measuring, and good subjects in stone, very well preserved, of any period of Gothic. Cheap day tickets to Cark or Grange stations (about the same distance) may be obtained from Barrow. The query with regard to Harrogate is rather misleading. Ilkley contains nothing worth measuring; Bolton Abbey (6 miles) is, however, full of subjects, but very often done by local students, especially portions of the Early English west front. Contrary to your reply, I should advise Harrogate as a centre, visiting Ripon, for the Minster (11 miles), Fountains Abbey—motor bus from Ripon or a pleasant country walk of 2½ miles from Wormald Green station (return rod. from Harrogate), and not on any account missing Markenfield Hall, a slight detour from the last-named route, a moated hall of Edward III. period, and Fountains Hall, close to the abbey, one of the finest things in Yorkshire (Jacobean). York is only 20 miles from Harrogate by coach or direct railway; Masham (fine church) same distance. Small churches within a radius of 4 miles of Harrogate are Knaresbro', Ripley (also castle), Kirkby Overblow, and Goldsborough. These are principally Perpendicular, but are worth a visit."

FIRE-RESISTING PARTITIONS.

THE accompanying illustration shows the fireproof partitions carried out at the "Underground" generating station at Chelsea by the Fireproof Co., Ltd., of Waldo House, York Buildings, Adelphi, W.C. The partitions are finished zinc, thick and are fire-, sound-, damp- and vermin-proof. The construction is clearly shown by the illustration and needs no description.

FIRE-RESISTING PARTITIONS AT THE "UNDERGROUND" GENERATING STATION AT CHELSEA, CONSTRUCTED BY THE FIREPROOF CO. LTD.

Coming Events.

Wednesday, July 19.

NORTH OF ENGLAND INSTITUTE OF MINING AND MECHANICAL ENGINEERS.—Excursion meeting at Darlington to inspect the Barton and Forcett mountain limestone quarries.

INSTITUTE OF SANITARY ENGINEERS.—Examination and Literary Committee at 3.30 p.m. Finance Committee at 5 p.m.

BUILDERS' FOREMEN AND CLERKS OF WORKS' INSTITUTION.—Half-yearly Meeting of Members at 8 p.m.

July 19 to 25.

ROYAL INSTITUTE OF PUBLIC HEALTH.—London Congress, President's inaugural address at His Majesty's Theatre to-day (Wednesday), at 3 p.m.

Saturday, July 22.

NORTHERN ARCHITECTURAL ASSOCIATION.—Annual excursion to Barnard Castle and Raby Castle.

Tuesday, July 25.

JUNIOR INSTITUTION OF ENGINEERS.—Visit to new Vauxhall Bridge works at 6.30 p.m.

Saturday to Monday, July 29-31.

INSTITUTE OF SANITARY ENGINEERS.—Summer Outing, to Southampton.

ARMY CONTRACTS.

SALE OF SURPLUS BOILERS, DISTILLING APPARATUS, DYNAMOS, AND OTHER PLANT AT BERMUDA, BARBADOS, ST. HELENA, AND WOOLWICH.

The Secretary of State for War is prepared to receive Tenders for the purchase of surplus Boilers, Distilling Apparatus, Dynamos, and other plant now lying at Bermuda, Barbados, St. Helena, and Woolwich, most of which is in first-rate condition, some lots being unused.

Forms of Tender, giving full description of the plant, particulars as to condition of the several lots and terms of contract, may be obtained on application to the under-mentioned Office.

The Tenders are to be delivered at the War Office, Pall Mall, London, S.W., by TWELVE o'clock noon on 1st September, 1905.

War Office,
Pall Mall, S.W.
3rd June, 1905.

TO BUILDERS, PAINTERS, etc.

The Guardians of the Poor of St. Marylebone Parish desire to receive TENDERS for PAINTING, CLEANING, and COLOURING WORKS, etc., at their Houseless Poor Wards, 86, East Street, Marylebone Road, W.

Persons desiring to Tender may obtain a specification and form of Tender any day from 19th JULY to 20th JULY (both days inclusive), between the hours of TEN a.m. and FOUR p.m., upon application to the Guardians' Architect, Mr. A. SAXON SNELL, F.R.I.B.A., of 22, Southampton Buildings, Chancery Lane, W.C., and depositing with him a £10 Bank of England note, which will be returned to persons sending bona fide Tenders in the manner and at the time stipulated.

Tenders to be signed, sealed, and endorsed "Tender for Painting, etc., Houseless Poor Wards," and addressed and delivered to me at my Offices, Northumberland Street, Marylebone Road, W., at or before TEN o'clock a.m. on MONDAY, JULY 24th, 1905.

The Guardians do not bind themselves to accept the lowest or any Tender.

By order,
HENRY T. DUDMAN,
Clerk to the Guardians.
Guardians' Offices,
Northumberland Street,
Marylebone Road, W.
12th July, 1905.

CENTRAL LONDON SICK ASYLUM DISTRICT. TO CONTRACTORS FOR GENERAL REPAIRS OF BUILDINGS, &c.

The Managers of the Central London Sick Asylum District hereby invite TENDERS for JOBBING WORK at their asylums in Cleveland Street, W., and Colindale Avenue, Hendon, N.W.

A copy of the form of Contract and Schedule of prices may be obtained at the Office of their Architect, Mr. WILLIAM LOCKWOOD, 3, Great Marlborough Street, Argyl Place, W., on payment of £2 2s., to be returned upon receipt of a bona fide Tender, and the return of all documents issued.

Tenders, addressed to the "Board of Management," will be received at the CLERK'S Office, Cleveland Street Asylum, not later than TEN a.m. on MONDAY, 24th JULY, 1905, and will be opened on the same day at FOUR p.m.

The Board of Management do not pledge themselves to accept the lowest or any Tender then received.

Persons Tendering are not required to attend personally when the Tenders are opened by the Board of Management.

FRED. W. BAILEY,
Clerk to the Board of Management.
Cleveland Street Asylum,
Cleveland Street.
July 12th, 1905.

EMPLOYMENT REGISTER.

Too late for Classification.

1243.—BUILDERS or CLERK of WORKS ASSISTANT (22). Drawing, tracing, quantities, details; 4½ yrs. exp.; certifi. bldg. construction; advanced, 1st. freehand, &c.

1251.—ASSISTANCE rendered in all branches of Architects' work.

1252.—PLUMBER, gas and hot water, or estate work; also painting; abstanter.

1253.—ARCHITECT'S ASSISTANT (23). 9½ yrs. exp. in Midlands; surveys, wkg. drawings, details; mod. s.

See p. xx for the Employment Register.

Privileges open to all Regular Readers of the "Builders' Journal."

I.—Free Monthly Advertisements.

1. A Free Advertisement of 12 words in the Wanted or Miscellaneous Advertisement Columns, in one issue of the BUILDERS' JOURNAL during each calendar month will be given to any regular reader.

2. The charge of one penny will be made for each additional word.

3. Advertiser's Name and Address or Box Number must be counted, but will in no case be reckoned as more than five words.

4. All advertisements must be accompanied by the correct remittance, and should a receipt be required a stamped addressed envelope must be enclosed.

5. The Proprietors reserve to themselves the right of refusing any advertisement.

II.—Free Answers to Enquiries.

1. The services of a large staff of experts are at the disposal of all regular readers who require information on architectural, constructional or legal matters.

2. Questions should in all cases be addressed to the Editor, and be written on one side of the paper only.

3. Correspondents are particularly requested to be as brief as possible.

4. The querist's name and address must always be given, not necessarily for publication.

Note.—Owing to the large number of enquiries we receive weekly, we are compelled to restrict the advantages of this department to Regular Readers.

III.—Free Accident Insurance of £500.

1. Every regular reader of the BUILDERS' JOURNAL is entitled to the benefit of this Insurance.

2. A Pamphlet giving full details of this and other Insurance schemes inaugurated by the BUILDERS' JOURNAL for the benefit of its readers, and guaranteed by "The Ocean Accident Corporation, Limited," will be sent on application.

What is a Regular Reader?

We have employed the term "Regular Reader" throughout these announcements as the description "subscriber" is often understood to mean one who subscribes direct to the publishing office.

We mean by a Regular Reader anyone who has placed an order with us or any newsagent or bookstall for the BUILDERS' JOURNAL for one year.

Those readers who order the BUILDERS' JOURNAL through their local newsagent or bookstall should send us the newsagent's receipt. Their names will then be placed on our subscribers' list, and they will be entitled to all the advantages set out above.

5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS.

OFFICE: 6, GREAT NEW STREET, FETTER LANE, E.C.

THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

July 26, 1905. Vol. 22, No. 546.

6, Great New Street, Fetter Lane, E.C.

Summary.

The Institute Bill for the enrolment of architects has been issued. It is recommended that the Architects' Act of 1906 (as it is called) shall come into force on July 1st, 1907, and that thereafter no one shall be allowed to call himself an architect without having secured the necessary certificate. (Page 54.)

The foundations of Liverpool Cathedral, though commenced in October last year and employing about 180 men, will not be completed till next March. To support the great twin towers, piers each 32ft. square at the base and tapering to 16ft. square at the top, have been built taken down in some instances to a depth of 50ft. The portion of the cathedral now in progress, representing not one-half of the whole structure, is estimated to cost £370,000. (Page 45.)

An excellent book on the planning of flats, by Mr. Sydney Perks, F.R.I.B.A., has just been published. It is very fully illustrated, and gives examples of flats abroad as well as those in this country. (Page 46.)

The National Competition designs are now on exhibition at South Kensington. Among the architectural designs Mr. Robert Atkinson, of Nottingham, secures a silver medal for his design for a lounge and staircase in a large hotel—the same which gained for him the R.I.B.A. Tite prize this year. There is a good show of designs for stained glass, wallpaper and wrought-iron, and the designs for tiles, furniture, wood-carving, &c., are interesting. (Page 48.)

The crowded state of Westminster Abbey, on account of the numerous monuments there, was the subject of debate in the House of Commons last week. Mr. Balfour indicated that it was about time they held their hand against further encroachments. (Page 49.)

A synopsis of the chief recommendations of the Royal Commission on London Traffic is given on page 52.

The Cheap Cottages Exhibition at Letchworth (Garden City) was opened yesterday. A large number of cottages have been erected with the idea of keeping the cost below £150, some of these being by well-known architects, who also submit designs for other cottages. (Page 55.)

The Council of the Cardiff, South Wales and Monmouthshire Society of Architects protests against the hurried way in which the designs for branch libraries at Canton and Cathays have been judged, and asks that the matter be referred back to the assessor, Mr. H. V. Lanchester. (Page 44.)

The pass list for the R.I.B.A. Midsummer examinations is given on page 52.

£5,000 is required for the restoration of Chichester Cathedral. Mr. Somers Clarke is directing the work. The experiments with baryta water on the tower have been very successful. (Page 45.)

The Institute Registration Bill.

ON another page of this issue will be found the text of the Institute Registration Bill, or, as it is called, the Bill for the Statutory Enrolment of Architects. We need hardly say that this will be studied with the greatest interest. There are no startling proposals embodied in it, but a number of points are defined which hitherto have been the subject of much speculation. It will be seen that the Act is proposed to come into force on July 1st, 1907. Provision is made for the inclusion of all *bona-fide* architects of two years' standing and for those persons who have served for ten years as pupil, apprentice or assistant to anyone entitled to be enrolled at the passing of the Act; and there is, too, the wide scope in the clause for including any person who has "such other qualification as may be approved by the Board," which claim is possibly intended to embrace the surveyor or civil engineer who practises as an architect: but of course the difficulties and defects of the first roll have always been recognized, and there is no occasion now to cavil at it. After the Act has become law, however, admission on the roll is to be only of those who have qualified by compulsory examination and by not less than five years' service with "a person enrolled or entitled . . . to be enrolled": though here again maybe the surveyor or civil engineer shows himself behind the mask: as also in the clause governing the charges for professional services, to which there is the special proviso that "nothing herein contained shall prejudice the right of professional members of the Institution of Civil Engineers or Surveyors' Institution to recover charges for work of any kind falling within the duties of their respective callings." We assume the Institute is now committed to the Bill, and in the next session of Parliament its introduction may perhaps be looked for.

Imported Materials.

WITH the exception of timber and ready-made joinery, we are not very much dependent in this country on imported materials for our buildings, though so far as concerns some internal fittings the trade is not free from that distinguishing mark of the foreigner—more so especially of the Teuton—which is so much resented in some other branches of industry. Indeed, the complaint about articles "Made in ——" is so familiar that it is refreshing to find one of our American contemporaries complaining about something of the sort even in that most wonderful Utopia across the sea. The thorn seems to have been that a certain millionaire saw fit to employ some stone from a foreign quarry in the erection of his house, as if there were nothing good enough for him in America,

and this is occasion enough for our contemporary to observe with customary American pride: "This land of our own abounds with materials of every kind for building purposes and can match and even excel every possible sample of stone from any and all of the quarries of Europe, and besides offer a greater profusion of varieties of each kind of stone than can be found in any foreign land. Take the list of American marbles, granites, limestones and sandstones, and they cannot be duplicated in the world, nor either one of them, for quality, for price, nor for the profusion in which they are offered to the selection of the intending purchaser." Selah.

Conditions of Competitions.

THERE has recently been cause to draw attention to the non-compliance with the conditions in certain competitions. It seems scarcely necessary to point out that in order to judge a number of designs submitted in any competition it is imperative that a copy of the conditions for competitors should be available, and it would be very helpful indeed if committees always provided a copy when holding an exhibition of designs. In glancing round such an exhibition there are often many designs which attract the eye and are really very well conceived, but as the test should be for the design most fulfilling the particular conditions set, these designs may be quite inferior to others which have recognized the restrictions or possibilities of the case and have been entirely governed by them. One would expect an assessor to be always aware of this, but from the recent discussion which has taken place it is evident that even assessors are likely to be at fault. In fact, they seem to fall into two classes—the one which is inclined to be impressed more by the artistic quality of the design, and the other by the planning and construction; hence, it has been suggested that a third assessor should always be appointed in competitions of any magnitude so as to bring about a more equitable result, though it might very possibly happen that the third assessor was a man of the same view as one of the others, in which event there would be two opinions, in the scale against one. The fallibility of assessors was instanced at the meeting of the Institute when the matter was under discussion, and the remark of one speaker is especially worth repeating, that three assessors could not be better than the ideal one, the best possible assessor that could be got; but that there were not enough best possible single assessors to go round, and therefore they had better try to get the best possible jury. However this may be, the strict selection of designs in compliance with the conditions set is a very important matter, and too much attention cannot be given to it.

CARDIFF LIBRARIES COMPETITION.

Protest against the Assessor's Award.

THE Council of the Cardiff, South Wales and Monmouthshire Society of Architects protests against the hurried way in which the designs for branch libraries at Canton and Cathays have been judged by the assessor, Mr. H. V. Lanchester. The number of designs submitted was twenty for each library, the first-premiated designs being by Messrs. Speir and Beavan and Mr. E. M. Bruce Vaughan.

Writing to the Library Committee of the Cardiff Corporation, the Council says: "We think that in view of the large amount of time and thought spent on these designs, competitors are entitled to have more time spent in their consideration, and we are convinced that had this been done the result would have been much more satisfactory, especially as a careful view and comparison of the designs exhibited is sufficient to convince any professional architect who is familiar with the requirements and the ordinary rules of library planning that there are designs in the room which are superior to those selected. It is also desired to call attention to clause 13 of the conditions, which states that if any design fails to conform to the conditions it will be excluded from the competition.

Violations of the Conditions.

"The first-premiated design for Canton violates clause 18 and also clause 21 as regards cost, *i.e.*, it is obvious that it cannot be carried out in its present form for the sum allowed. The second-premiated design for Canton violates clause 30, inasmuch as the librarian's room is only about 90ft. super. instead of 150ft. super. The first-premiated design for Cathays violates the intention of the conditions, inasmuch as no use can be made of the staff entrance without exceeding the limits of the site. The second-premiated design for Cathays violates clauses 18 and 21 as regards cost, *i.e.*, it cannot be carried out in its present form for the sum allowed.

"All the premiated designs show disregard of the ordinary rules of library planning, particularly with regard to the distances between the bookcases and tables, and obviously to provide the proper spaces would necessitate an entire rearrangement of the plans.

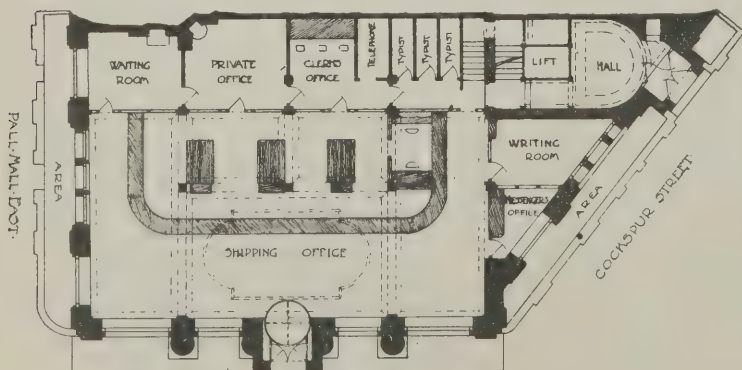

"In two of the premiated designs the ends of the bookstacks abut on the back walls so that circulation around them is impossible, and in addition to this no counter has been shown on the inside of the turnstiles for the staff enclosure, without which it would be impossible to work the library, and there is no room to put such an enclosure without altering the whole of the lending department. Clause 13 of your conditions is very clear, and as all the premiated designs have failed to comply with the conditions we respectfully ask you to refer the matter back to your assessor."

NEW SHIPPING OFFICES.

THE new offices illustrated on this page have recently been completed for the International Navigation Co., Ltd., combining the Red Star, White Star and other lines, the architect being Mr. Henry Tanner, junr., A.R.I.B.A., of London. The building faces down Pall Mall, and has frontages to Cockspur Street and Pall Mall East. It has been erected by the Waring-White Building Co., Ltd., but not on the American method employed by them at the Ritz Hotel, Piccadilly, where the steel framework of the building was built up without the aid of outside scaffolding, and the stone and brickwork attached to it afterwards. There is a considerable amount of steelwork at these shipping offices, but the walls are solid and take the weight.

The stone is best Whitbed, supplied by Messrs. John Pearce & Co., of Portland, and worked by the Bath Stone Firms, Ltd., at their masonry works at Portland. The accommodation is shown by the accompanying plans. The large office on the ground floor is lighted from three sides, and the offices at the back are top-lighted. The woodwork is American walnut, with oxydized steel-bronze fittings and interlocking rubber-tiled floor. A drawing of the building is exhibited at this year's Academy. The architect was influenced in his design by the fact that the site belongs to the Crown, and it is ultimately proposed to treat the whole block as one with the College of Physicians and the Union Club at the east end, which fact accounts for the carrying round of the main cornice at an unusually low level.

GROUND-FLOOR-PLAN.

SECOND-FLOOR-PLAN.

NEW SHIPPING OFFICES, COCKSPUR STREET, LONDON.

HENRY TANNER, JR., A.R.I.B.A., ARCHITECT.

THE ERECTION OF LIVERPOOL CATHEDRAL.

Progress of the Foundations.

IT is just over a year since the foundation-stone of Liverpool Cathedral was laid by His Majesty the King. Since then a great deal has been done towards the erection of this huge building. The work of excavating for the foundations commenced in October last year, but although the contractors, Messrs. Morrison & Sons, of Wavertree, have kept about 180 men regularly employed, the foundations will not be completed until next March; in other words, nearly a year and a half will be occupied in the foundation work of a portion of the cathedral which does not represent one-half of the whole structure. The section which is now being prepared for the superstructure

ones to 35ft., giving a rock average of 43ft. So far as the western tower is concerned, the only pier as yet built to the ground level is the one which bears the stone laid by His Majesty.

The chapter-house and the east portion of the vestries are situated on the cemetery side, and in consequence the excavations have had to be taken to an average depth of 43ft. from the datum or nave floor line. These foundations are about half finished. On the western side rock was struck very close to the surface, with the result that it was only necessary to take the foundations for the Lady chapel to an average depth of 7ft. In order, however, to afford an easy and level approach to the Lady chapel, chapter-house and vestries from St. James's Road, the Mount has been cut away over an area of 200ft. by 150ft. to a depth of

CHICHESTER CATHEDRAL.

Statement by Mr. Somers Clarke.

SPEAKING at the recent meeting of the Chichester Cathedral Repair and Restoration General Committee, held at Brighton, Mr. Somers Clarke said he believed £5,000 would be sufficient to do what was required. But, as everyone was aware, when an ancient building had to be dealt with it was impossible to say what might be revealed. Chichester Cathedral had undergone perhaps more internal volleys than any similar building now remaining in the country, and finally with the terrific crash of the centre tower it was obvious many parts of the building might have been slightly shaken, although there was nothing now to cause apprehension. The experiments with baryta water on the

THE YORK MINSTER DISPUTE: PINNACLES AND REMAINS OF FLYING BUTTRESSES ON SOUTH SIDE OF NAVE.

As reported in our columns, considerable discussion has been going on in reference to the rebuilding of the flying buttresses shown in the above view. There is no doubt that the buttresses did originally exist complete, as no fewer than seven old prints in the Minster library represent them so, but they were suffered to get out of repair and were partially or entirely pulled down at a time when any taste or care for church architecture was at its lowest ebb. The nave is not stone vaulted, but has a timber roof, and on that account objection to the re-erection of flying buttresses has been made: nevertheless it is a fact that the roof is pushing out the clear-story walls, and Mr. Bodley's contention that the addition of the flying buttresses is most desirable seems to us indisputable in view of the actual state of things. Readers will find a number of interesting illustrations of the Minster in an Eighth Occasional Paper recently published by the Dean, to whom we are indebted for the above photograph.

includes the Lady chapel, the chapter-house, the eastern vestries, the choir up to the crossing of the transepts, and the two great twin towers, but the funds for the erection of the latter are not yet available: these towers are to be each 275ft. high: the central tower of York Minster is 200ft. high.

Foundations for the Great Towers.

The foundations of the eastern tower and the Lady chapel are finished, and excavations are proceeding apace in connection with the chapter-house and vestries, and the heating and blowing chambers, which are to come under the western tower. The foundations of these gigantic towers both comprise four piers, each 32ft. square at base and tapering to 16ft. square at the top. It was found necessary to take the two outer piers of the eastern tower on the cemetery side down to a depth of 50ft. and the inner

14ft. About 2,000 tons of earth and yellow sandstone were thus removed.

The portion of the cathedral now in progress is estimated to provide accommodation for 3,500 worshippers, and, exclusive of the cost of the great towers, the expenditure is likely to reach £370,000, towards which amount about £270,000 has been subscribed or promised; leaving £100,000 still to be raised.

Sir William Forwood was able to announce last week that the Lady chapel will probably be completed within the next five years, but from ten to twelve years must elapse ere the remainder is ready for divine service.

The joint architects of the cathedral—which will be the largest in England, and with three exceptions the largest in the world—are Mr. G. Gilbert Scott and Mr. G. F. Bodley, R.A.

campanile had proved very successful indeed and the committee were now going on applying it to the octagon at the top of the tower. Then there were the north-east and the south-east turrets to be built, and other important work was the repair of the roof. As soon as the damp got through the lead roof into the gutters it fell into the pockets of the vaulting, collected in a puddle, and went through, making stains and marks. Therefore as the money was collected it should be set aside in two separate sums, taking, say, two-fifths for the work to the bell tower now in progress and three-fifths for the roof, until there was enough money collected for the roof for doing one whole piece. (At Chichester, besides the restoration of the cathedral tower, the reconstruction of the old Oliver Whitby Bluecoat School and the extension of St. Mary's Hospital are being carried out).

Views and Reviews.

A Standard Book on Flats.

It seems strange that, though so many books have been published on architecture and construction, we are still without treatises in English on several types of buildings which are continually being erected throughout the country and in regard to which there is a great deal to learn from the experience of others; thus there is no book in English on the planning of town halls and municipal buildings; neither is there a good book on libraries, and until recently there was not a comprehensive treatise on schools. The book now before us fills in another deficiency, namely, the planning of all classes of flats and tenements.

By the growth of cities the housing problem has become extremely difficult and complicated, and there are scores of points for the architect to solve in respect to the planning of flats. This book, therefore, by Mr. Sydney Perks, will be heartily welcomed. It is excellently done, well arranged, and illustrated in the best possible manner, the numerous plans being all very clearly drawn and reproduced to a good size, so that it is possible to follow the internal arrangements with the greatest facility. As these plans are the work of so many different architects we are sure a great deal of trouble must have been involved in presenting them in the uniform manner of this book. The lettering is in every case clear, and a scale is given always, this latter being a most important item when it is recollected that the planning of flats involves the provision not only of the most workable arrangement of rooms but also

their placing so as to obtain the utmost space for each. Moreover, the author does not confine himself to flats in England, but very wisely introduces a large number of examples from Paris, Vienna, Madrid, Holland and America. This is especially commendable, as the planning of flats on the Continent, more especially in France, has always been recognized as very skilful, embodying many features of merit.

In the introductory chapter Mr. Perks deals with the historical side of the subject, making special reference to the flats of the seventeenth and eighteenth centuries in Old Edinburgh. In these flats it was, and often still is, customary to find the bed in a large cupboard enclosed by doors, and this bed recess is often adopted in modern French plans. It certainly has the advantage of giving a very neat appearance to the room, but we hardly think that it has any other merits. The author observes that although the buildings of the sixteenth and seventeenth centuries were similar to one another, and no doubt were built on the lines of earlier buildings, when we come to the eighteenth century the plan is entirely different, the w.c. being placed in the centre of the building, without any external ventilation, the reason for this probably being that the old buildings had no drainage, while the new buildings were provided with such, and it was thought that everything being taken away at once by pipes the closet would always be pure and untainted. In the nineteenth century, with the advance of sanitary science, all this of course was abandoned.

A number of examples of old flats in London are given, and then the author proceeds to deal with the numerous details

in the planning of modern examples. We have not the space to go into a tithe of these, and we can only say that they are all dealt with very fully and clearly, points of detail being often illustrated by small parts of plans showing, for example, the best arrangement of the hall, bathroom, kitchen, &c. With regard to this last, attention is drawn to the desirability of placing the kitchen within easy service of the dining-room, but we quite agree that it is a mistake to carry the idea so far as to spoil the remainder of the plan, because, as regards the keeping of things hot, and the smell of cooking, it makes very little difference whether the dishes have to be carried roft. or zoft. The author thinks it better to put the kitchen next the dining-room rather than the drawing-room; and he does not favour a serving hatch as it allows sound from the kitchen to pass easily into the dining-room, which is not at all desirable. Sculleries, he considers, should be abolished, as they are abroad, a sink in the kitchen being all that is required.

The ideal plan for a high-class suite of flats is one that has all the servants' rooms well cut off from the other part of the suite so as to form, in fact, another suite inside the main suite, with an entrance door. Such an arrangement is given in the plan of Alexandra Court, Queen's Gate, on the opposite page. Here, it will be seen, there is a central courtyard in each wing, with two suites on each floor and one suite at the back. This has the least passage room, as the rooms are grouped around the lit. The flats facing the courtyard are preferable to the others, as the servants' bedroom is well away from the kitchen, and the w.c. is placed between them. The plan of Kensington Court Mansions, also taken from this book and given on the opposite page, is only a small portion of a very large block of flats. The servants' quarters are so isolated from the other rooms that they could be let as a separate suite. A servant going to open the entrance door would not pass through the entrance hall. Slops would not be taken through the kitchen, and all sound or smell of cooking is cut off by two doors. The arrangement of the w.c.'s is economical.

In chapter III. Mr. Perks deals with artisans' dwellings, giving particulars of buildings of this class erected in London, Birmingham, Liverpool and other towns. The author then proceeds to give a great number of plans, illustrated with a few elevations and photographs, of modern flats erected in different parts of London, each being accompanied by some critical note. Chapter V. is concerned with practical notes relating to floors, ceilings, partitions, staircases, windows, &c., and then follows a collection of examples from abroad, nearly every one of these plans having had to be re-drawn and the English scale marked. Chapter VII. deals with financial matters relating to the subject, while the concluding chapter (VIII.) gives forms of agreement for the letting of flats.

We can only repeat that the book is in every sense admirable, and all architects who are concerned with the subject should not fail to have this volume on their shelf.

"Residential Flats of all Classes, including Artizans' Dwellings," by Sydney Perks, F.R.I.B.A. London: B. T. Batsford, 94, High Holborn, price 21s. nett.

THE DESIGN OF FLATS: NOS. 18, 19 AND 20, FOLEY STREET LONDON, W.
PROF. BERESFORD PITE. ARCHITECT.

Classes in Engineering and Building Construction at the Goldsmiths' Institute. — Students living in south-east London will be interested to learn that the evening classes previously held in engineering and building subjects at the Goldsmiths' Institute are to be continued during the session 1905-6. This has been made possible by a grant from the London County Council to the University of London for this specific purpose; the work being under the control of a delegacy appointed from both bodies.

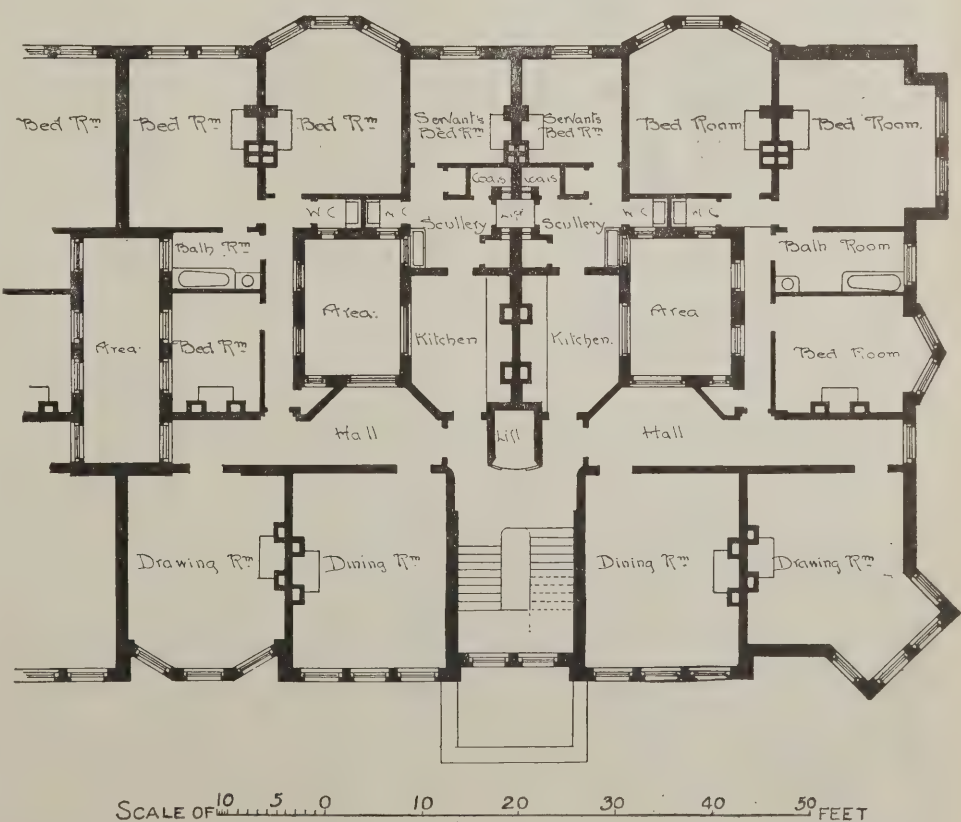

THE PLANNING OF FLATS: ALEXANDRA COURT, QUEEN'S GATE, LONDON. PAUL HOFFMANN, ARCHITECT.

Correspondence.

A Recreation Club for Architectural Students.
To the Editor of THE BUILDERS' JOURNAL.
 SIR,—I am very pleased to see Mr. Gordon's letter. A social club for students has always struck me as being particularly estimable. The Architectural Association does little or nothing to foster the social element among its members, though many students would, I am sure, be only too glad to join such an institution as that suggested. There they could meet others of their craft and find some relaxation from the difficulties and trials of office routine. —Yours truly,
 E. C. MORGAN WILLMOTT.
 KENSINGTON.

Plumbers' Fittings at King's College.
To the Editor of THE BUILDERS' JOURNAL.
 SIR,—Alluding to the reference to a report of the Education Committee of the London County Council on p. 27 of your issue for July 12th, will you allow me space to say that the offer made by the Plumbers' Company was not unconditional, or, as implied, a free gift, but that the workshops, fittings and appliances provided by the Company at King's College at considerable cost should, for the purpose of extended use for the advanced instruction of plumbers, be placed under the charge of a joint committee of representatives of the London County Council and the Plumbers' Company with that object. —Yours truly,
 W. R. E. COLES.
 Clerk, Worshipful Company of Plumbers.
 LONDON.

THE PLANNING OF FLATS: KENSINGTON COURT MANSIONS. PERRY AND REED, ARCHITECTS.

TWO COTTAGES AT LETCHWORTH (GARDEN CITY). ROBERT BENNETT, A.R.I.B.A., AND WILSON BIDWELL, ARCHITECTS.

In the design of these cottages at Letchworth (Garden City), near Hitchin, in Hertfordshire, the great aim has been simplicity, to use local materials in a local manner, and to get some of the very pleasing effects found in the plain rough-cast gables which form the feature of the Hertfordshire cottage. The cottages have a roof of local red hand-made tiles, brought low in front to form a shady sitting-out place, partly screened from sun and wind. The walls are of brickwork, rough-cast and lime-whited, with rough-cast chimney stacks and red pots. The paint is bright green outside and white inside. The plan provides a large living-room, 17ft. 6ins. by 14ft., with open fire recess, cross-lighted by either east or west window, as the case may be. The studies have sunny south bays. On the first floor are four good-sized bedrooms (all with fires), also bathroom and w.c. The cost was £580 per cottage.

NATIONAL COMPETITION DESIGNS.

THE prize designs submitted in the National Competition for 1905 are now on exhibition at the Victoria and Albert Museum, South Kensington. The number of works sent up for examination this year was as follows:—13,674 from 260 schools of art and branch schools; 1,573 from 93 science evening schools and day classes; 1,519 for 168 art evening schools and day classes, and 38 from two technical institutions. Nine gold medals have been awarded, 61 silver medals, 249 bronze medals and 427 book prizes.

Architectural Designs.

In this section Mr. Robert Atkinson, of Nottingham, secures a silver medal for his design for a lounge and staircase in a large hotel—the same which gained for him the R.I.B.A. Tite prize this year. This is quite the best of those exhibited, the only other design of merit being that for a tomb to G. F. Watts, by Mr. Henry Bannister, of Regent Street Polytechnic, to which a silver medal is also awarded. In their report on the architectural designs, the examiners (Mr. John Belcher, A.R.A., Mr. Reginald Blomfield, A.R.A., and Mr. T. G. Jackson, R.A.), observe that the regrettable falling-off in the quality of the work reported on last year is continued. Many of the designs submitted were so entirely lacking in all the essentials of architectural design as to show that the students had received no instruction of any architectural value. Such works, amongst which were some glaringly bad designs for churches, received a condemnatory mark from the examiners, and they should not have been submitted for competition.

Measured Drawings.

Among these there is nothing of particular interest exhibited. Mr. Robert Atkinson gains a silver medal for drawings of the chapter-house doorway of Southwell Cathedral, Mr. James Freeman a bronze medal for drawings of the gateway to St. John's College, Oxford, Mr. W. Dathy Quirke, of the Birkbeck College, a bronze medal for drawings of St. Benet's Church, Paul's Wharf, E.C., and a few other bronze medals for work of no special merit. In connection with the study of modern buildings, the examiners desire to call special attention to their remarks of last year, as to the necessity

of greater care being taken to select only good examples. In spite of the remarks then made, the examiners regret to find instances of wrong selection, and they would impress upon masters the fact that the study of bad modern examples is calculated to do the students nothing but harm. The examiners note the many instances in which students submit a long series of bays and arches of one type. There is no occasion for this prodigality in time and labour, one example of each kind being sufficient for the purposes of study. In some cases architectural sculpture is shown in outline only, which is misleading, and in others a good drawing in pencil is accompanied by a copy in ink. Such work is largely a waste of the students' time.

Designs for Tiles.

The general character of the work, although of very fair average quality, is not equal to that of last year, and the examiners have not found anything of sufficiently high merit to warrant the award of a gold medal; but they again commend the improvement shown in the choice of colour. A silver medal is awarded to Mr. Albert Hackney, of the Burslem School of Art, for a bold and successful design for majolica tiles, in which the colour is well chosen, the surface well covered and the general form graceful in effect; and a bronze medal is awarded to Mr. James Bancroft, of the Macclesfield School of Art, for two ambitious designs for panels, which would have commanded a higher award if the figures had been better drawn. A bronze medal is also awarded to Miss Margaret May, of the Carlisle School of Art, for a skilful design for stencilled wall tiles.

Stained Glass.

There is a good show of work in this class. The examples from the Birmingham School of Art are distinguished by intelligent understanding of the technique of stained glass, and great taste and inventiveness in design. A silver medal has been awarded to Mr. Bertram Lamplugh, of the Birmingham School of Art, for a clever design for a stained-glass window and for a set of exceptionally interesting designs for quarries. The devices in the latter are exceedingly inventive, appropriately executed, and well-adapted for glass. A silver medal has also been awarded to Miss Ethel Rhind, of the Dublin School of Art, for an excellent design for a window, showing a proper use of

shading; and another silver medal to Miss Margaret A. Rope, of the Birmingham School of Art, for an imaginative design well-planned for treatment in glass.

Wallpapers.

In this section there is a notable improvement both in the quantity and the quality of the work, which seems to have attracted students of more ability than has been the case in recent years. Generally speaking, there is a better understanding of the technical requirements of the manufacture of wallpaper, though there are some instances in which the lines of the design run too close together, so much so as to inevitably entail clogging in the actual printing. Other designs are marked by want of taste and bad colouring, while some of a more ambitious type, introducing figures, though not without merit, are unsuccessful as ornamental repeating designs. Friezes are generally inferior to the fillings they accompany, and indeed, as a class, are less successful than the other designs. The examiners are glad to notice an absence of the affectation and eccentricity which have been so much in evidence in recent years, and to observe indications of the decorative appreciation of beautiful natural forms.

Furniture, Woodcarving, Gesso-work, &c.

The average of excellence is on the whole rather higher than last year, though no individual work reaches a sufficiently high level to warrant the award of a gold medal.

Structural Metalwork.

There is a decided advance upon the standard of last year in the legitimate treatment of wrought-iron in those designs which are executed in the material. Some designs show want of appreciation of the capacity and limitations of wrought-iron. A silver medal is awarded to Mr. Albert Halliday, of the Bradford (Technical College) School of Art, for a design for wrought-iron hinges and lock-plate for a church door, showing the form of a cross cleverly suggested by the space between the ends of the hinges. It is unfortunate that the dignity of the whole is injured by the character of the lock-plate, which is not in harmony with the simplicity of the remainder of the design. A bronze medal is awarded to Mr. Alfred B. Jones, of the Birmingham School of Art, for a thoroughly well constructed design for a sign bracket.

Taken as a whole, the exhibition maintains the progressive tendency observed in recent years, and is well worth a visit. It is open till the end of August, from 10 to 10 on Mondays, Tuesdays and Saturdays, and from 10 to 6 on Wednesdays, Thursdays and Fridays; Sundays, 2 to 7.

The Quarrying of Box and Monk's Park Stone.—In the course of a recent visit paid by the Portsmouth Master-Builders' Association to Bath an inspection was made at the famous quarries of the Bath Stone Firms, Ltd., at Box and Monk's Park. On arriving at Box a visit was paid to the underground workings from which the well-known St. Aldhelm Box Ground stone is quarried. The workings run for many miles underground; in fact, it is estimated there are sixty miles of workings throughout the whole of the company's underground stone mines. The visitors were very much struck with the coolness and the purity of the atmosphere. Massive stones—one of 10 tons' weight—were shown, having just been severed from the rock. At the Box workings the visitors were able to walk straight into the side of the hill, but at Monk's Park it was necessary to descend 80ft. or 90ft. under the surface by means of a sloping shaft. The Monk's Park quarry workings are somewhat higher and more capacious than those at Box, and great interest was manifested in the quarrying of the stone.

IN PARLIAMENT.

(By Our Press Gallery Representative.)

IT has been decided by the sub-committee in charge of the arrangements in connection with the memorial to Sir William Harcourt that the statue should be placed in the members' lobby of the House of Commons, and that the execution of the memorial should be entrusted to Mr. W. Story, of Rome.

The propriety of removing the Cornwell monument in Westminster Abbey has been debated in the House of Commons as well as in the House of Lords, and Mr. Balfour generally defends the proposal of the Dean of Westminster to make room for the Salisbury memorial by curtailing the monument to Captain Cornwell. He, however, admits that if it is the general opinion among the public that the proposals are not suitable, he will use his influence to prevent them being carried out.

A new Bill relating to Public Monuments.

Sir Elliott Lees raised the discussion in the Commons by introducing a Bill to prevent the removal of public monuments in cathedrals and churches without Parliamentary sanction; but by the action of the Speaker, who was assured that the Bill would not come into operation till 1907, the debate was adjourned after Mr. Balfour had replied to Sir Elliott on the subject of the Salisbury memorial. The Bill, of course, will not be further heard of this session.

The Crowded Abbey.

In the discussion referred to Mr. Balfour spoke of the crowded state of the north transept of the Abbey, and said that to put the memorial to Lord Salisbury there would render that part impossible from an architectural point of view. He thought they had almost reached the time when a much more drastic Bill than that proposed by his honourable friend was needed, by which it would be laid down that no money voted by the country should go to a full-sized statue or effigy of any statesman, soldier or sailor, however distinguished his services or great his career.

Bridge over the Serpentine.

Lord Balfour, replying to a question by Captain Jessel, who wished an explanation of the delay in repairing the bridge over the Serpentine, stated that it was not advisable to commence the repairs to this bridge during the season owing to the obstruction which would be caused to the traffic. It was intended to commence the work as soon as Parliament rose, and to complete it by some date in October.

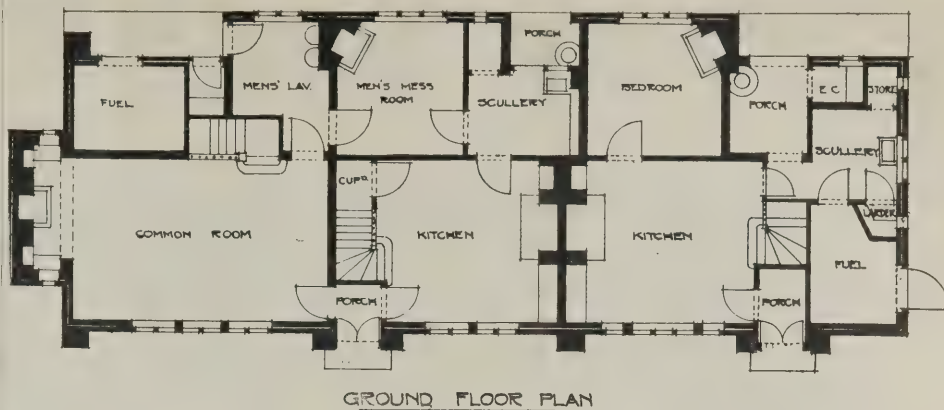

Overtime at Ordinary Wages.

Mr. Sydney Buxton asked the Financial Secretary to the War Office whether Messrs. Playfair were carrying out a building contract in connection with the Woolwich Dockyard, and whether in connection with the contract the men employed were working the hours of men recognized by the Master-Builders' Association and the Amalgamated Society of Carpenters and Joiners, namely, 6.30 a.m. to 5 p.m., or whether they had to begin work at an earlier hour at ordinary rates of wages.

Mr. Bromley Davenport replied: It would appear that the men employed on this contract are working overtime at ordinary rates of wages. Enquiry will be made of the contractors as to the practice.

Messrs. Waygood and the new Sessions House Lifts.

Mr. Keir Hardie asked Lord Balfour whether it had been represented to him that Messrs. Waygood & Co., liftmakers, who were now executing Government contracts at the new Sessions House, Old Bailey, and

the Land Registration Office, was a non-union firm which made it a condition of employment that none of its workers should be members of the Amalgamated Society of Engineers or any other trade union, and that the conditions under which joiners and French polishers worked were in violation of those sanctioned by the trade unions, and what action he intended to take in connection with those representations.

Lord Balfour stated that the First Commissioner of Works was not responsible for the building and equipping of the new Sessions House, Old Bailey: The United French Polishers (London) Society had made a representation to the First Commissioner regarding the non-employment by Messrs. Waygood of union men. The First Commissioner having made careful enquiry was satisfied that Messrs. Waygood did not discriminate in any way as regards the employment of union or non-union workmen as joiners. It appeared that in the polishing shop some men had been required to state whether they were unionists or not, but that had been done without the knowledge of the directors, who had given instructions that it should not occur again under any circumstances. In the execution of any Government work with which they might be entrusted Messrs. Waygood would of course be required to conform to the spirit and

intention of the resolution of the House of Commons of February 17th, 1891.

OUR PLATES.

THE cottages at Abinger, Surrey, are built with hollow walls of stock bricks, lime-whited outside, and the roofs tiled. The external doors and the window frames are of oak, the sashes having iron frames with lead lights. In one end of the building is a common room on the ground floor, and cubicles for the use of unmarried outdoor men-servants on the owner's estate, the centre and other end being built as ordinary cottages for married people. Messrs. W. Dunn & R. Watson were the architects, and Messrs. W. & G. King, of Abinger Hammer, Dorking, were the builders.

The house near Edgerton, Huddersfield, is built of local stone of broken colour, with stone slates on the roof. The site is elevated. The entertaining rooms are panelled with oak. A conservatory of stone has been added on the garden front, filling the angle of the entrance. Mr. Edgar Wood was the architect, and Mr. Mark Brook, of Huddersfield, the builder. All the woodwork was executed by Messrs. Wood & Sons, of Huddersfield, and the casements were supplied by Messrs. George Wragge, Ltd., of Wardry Works, Salford, Manchester.

R.I.B.A. MIDSUMMER EXAMINATIONS.

THE following is the pass list in the Midsummer examinations of the Royal Institute of British Architects:—

Preliminary.

The preliminary examination, qualifying for registration as Probationer R.I.B.A., was held in London and the under-mentioned provincial centres on June 6th and 7th. Of the 245 candidates admitted, fifty-three claims for exemption from sitting for the examination were allowed. The remaining 191 candidates were examined with the following results:—

District.	Number examined.	Passed.	Relegated.
London - - -	78	48	30
Belfast - - -	1	1	-
Birmingham - -	8	5	3
Bristol - - -	15	11	4
Cardiff - - -	7	2	5
Glasgow - - -	6	4	2
Leeds - - -	26	17	9
Manchester - - -	31	14	17
Newcastle - - -	19	15	4
	191	117	74

The passed candidates, with those exempted—numbering altogether 170—are as follows:—

W. N. Adams (Liverpool)
J. A. Allan (Aberdeen)
T. S. Allan (Glasgow)
S. P. Allen (Cheddar)
C. S. Archer (Johnstone, N.B.)
C. D. Arnott (Gorleston-on-Sea)
G. T. Arthur (Bristol)
J. T. O. Aynsley (Sunderland)
D. W. Ayre (Cork)
W. F. E. Badcock (Bishop Auckland)
V. Bain (Sunderland)
W. A. Banks (Stafford)
S. R. Banks-Smith (St. Leonards-on-Sea)
T. H. Barrow (London, S.E.)
W. A. Batty (Wolsingham)
J. K. Beal (Newcastle-on-Tyne)
B. Beetham (Darlington)
W. Bell (Bradford)
T. Bennett (Gravesend)
W. B. Binnie (Airdrie)
A. C. Blackmore (Cottingham)
G. Bramwell (Gargrave-in-Craven)
W. G. Brett (Clevedon)
H. W. Brittan (Croydon)
A. St. H. Brock (North Cheam)
J. Brodie (Edinburgh)
T. H. Broomhall (Haigh, Barnsley)
W. G. Brown (Leighton Buzzard)
A. Bryett (Manchester)
S. H. Burgess (West Hartlepool)
P. Butlin (Rothwell)
W. W. Caithness (Ealing)
H. D. Champion (Balham, S.W.)
H. M. Chippindale (Scholes, Leeds)
C. Christie (Falkirk)
P. Coates (Sheffield)
A. V. Cole (Watford)
D. Colville (Aberdeen)
W. B. Cook (Huddersfield)
G. J. Coombs (Bournemouth)
F. Coyle (Blackhill)
R. Craddock (Wolverhampton)
R. H. Crook (Southport)
J. A. Davidson (Knock, co. Down)
R. H. Dewhurst (Harrogate)
F. A. Doggett (Cambridge)
A. M. Durrant (Hemel Hempstead)
C. D. Eckstein (Wolverhampton)
B. J. Emery (Lowestoft)
H. D. Emms (Southend-on-Sea)
R. W. Featherstone (Canterbury)
W. S. Fisher (Wellingborough)
G. E. Fitzgerald (London, W.C.)
E. G. Fletcher (Ulverston)
N. D. Fourdrinier (Brook Green, W.)
R. W. Furniss (Loughborough)
R. T. Garrow (Aberdeen)
H. V. Godfrey (Shepherd's Bush)

J. H. Gray (London, W.)
W. Green, junr. (Aberdeen)
S. Greig (Clapham Common)
H. C. Gieves, junr. (South Shields)
F. V. Griffin (Ealing)
F. Grissell (Notting Hill Gate, W.)
J. K. Ground (Wandsworth Common, S.W.)
C. O. ap Gruffydd (Wellingborough)
N. W. Hadwen (London, W.)
F. W. Hagell (Whitehall Park, N.)
E. S. Hall (West Dulwich)
H. S. Hall (Nottingham)
C. A. Hallatt (Wath-on-Dearne, Rotherham)
P. K. Hanton (Islington)
W. H. Harrison (Blackburn)
K. W. Hartland (Bristol)
E. H. Hawkins (Southampton)
F. Heath (Warsop, Mansfield)
J. Heelis (Bolton)
F. E. Henson (Wellingborough)
J. R. Hindmarsh (Newcastle-on-Tyne)
J. G. Hinton (Exeter)
C. O. Hooper (Southampton)
T. C. Howitt (Hucknall Torkard)
A. E. Hughes (Newark-on-Trent)
W. H. Jackson (Balham)
R. Jeffrey (Ashford)
R. E. Jew (Reading)
L. P. Johnson (London, S.E.)
W. Kaula (South Hampstead)
H. L. Knapman (London, N.W.)
H. F. Kohler (London)
C. S. Legat (Sunderland)
J. D. Lucas (Woking)
J. C. McAleer (Wokington)
F. W. Marshall (Solihull, Birmingham)
F. N. D. Masters (Doncaster)
F. J. McC. Maxwell (Bedford Park, W.)
R. Mayhead (Reading)
C. Medley (Keighley)
F. E. Mennie (Mile End, E.)
H. Michalowsky (Dalston, N.E.)
W. S. Mills (Leicester)
H. Monk (Durham)
D. H. Morgan (Aberdare)
G. C. Nairne (Inverness)
T. H. Needham (Acton)
H. W. O'Reilly (Cheltenham)
O. L. Owen (Swansea)
W. McP. Page (London, S.W.)
H. C. Perry (Bournemouth)
A. N. Peto (Leeds)
J. C. Pocock (Chiddingfold)
E. J. Polglase (Bristol)
J. Pollard (Hollywood)
F. Powell (Bradford)
H. C. Powell (Buxton)
W. S. Purchon (Tooting Common, S.W.)
R. Pywell (Hanwell, W.)
E. A. R. Rahbula (Clapham, N.E.)

F. Rattenhuber (Shepherd's Bush)
W. D. Rees (Cardiff)
W. C. Rhodes (Chelsea, S.W.)
L. Rigby (Manchester)
R. H. Riley (Lr. Darwen)
R. L. Rollo (Glasgow)
S. W. Ross (London, S.W.)
F. J. St. Aubyn (Battersea)
E. J. Scaife (Bolton)
E. R. D. Selway (Stourbridge)
N. F. Shanks (Manchester)
A. G. Sheath (Eastbourne)
E. P. Shelbourne (Melton Mowbray)
C. A. Smeed (Stratford)
F. W. Smith (Newark-on-Trent)
J. R. B. Smith (Furze-cote, Botley)
L. Smith (Huddersfield)
E. A. Spurling (St. Leonards-on-Sea)
G. Stanley (Trowbridge)
M. J. Stead (Halifax)
C. H. Stock (Carlisle)
E. W. Stubbs (Norwich)
H. C. Talbot (Ilford)
G. C. Thompson (Gateshead)
A. K. Thorn (Wandsworth Common, S.W.)
P. A. Tilden (Northwood)
A. J. E. Toone (C-on-M., Manchester)
H. Trepess (Warwick)
K. W. Turner (Ipswich)
G. A. Vallance (Mansfield)
P. J. N. Vincent (Plymouth)
H. Walker (Hull)
W. D. Walker (Halifax)
H. G. Warren (Exeter)
H. E. Watkinson (Goodmayes)
F. E. Watson (South Ealing, W.)
R. W. Webb (Bristol)
F. P. Webster (Sheffield)
A. B. West (Abingdon)
J. L. West (Abingdon)
C. Whitby (Sandown, I.W.)
N. A. Whitham (Barnsley)
E. S. Wilde (Weston-super-Mare)
W. H. Wilkinson (Halifax)
A. Winch (Roundhay, Leeds)
J. E. Winfield (London, N.W.)
P. M. Wood (Manchester)
B. W. Woodhouse (Carlisle)
G. G. Wormum (Hampstead, N.W.)
L. Worth (Bournemouth)
S. Wright (Macclesfield)
H. Young (Portsmouth).

Intermediate.

The intermediate examination, qualifying for registration as Student R.I.B.A., was held in London and the undermentioned provincial centres on June 6th, 7th, 8th and 9th. One hundred and fifty-seven candidates were examined with the following results:—

District	Number examined.	Passed.	Relegated.
London - - -	93	44	49
Bristol - - -	10	6	4
Glasgow - - -	5	5	0
Leeds - - -	18	13	5
Manchester - - -	24	15	9
Newcastle - - -	7	5	2
	157	88	69

Names in order of merit as placed by the Board of Examiners:—

C. D. Davy (Maidenhead)
W. J. M. Thomasson (Bournemouth)
W. Harvey (London, W.)
A. G. Henderson (Glasgow)
J. M. Jenkinson (Sheffield)
A. Binning (Blackheath, S.E.)
H. Moss (Manchester)
E. Morley (Bradford)
H. Lidbetter (Carlisle)
A. W. Kenyon (Sheffield)
A. G. Bray (Bolton)
S. J. Wearing (Leicester)
A. S. Constable (Stockfield-on-Tyne)
J. W. Corney (Leeds)
F. Woods (Maidenhead)
D. A. Adam (Newcastle-on-Tyne)
F. Donaldson (Bishop Auckland)
N. J. Dawson (Foxhall, Ipswich)
L. W. Edmonds (Balham, S.W.)
F. Meakin (London, E.C.)
W. R. Spurr (Batley)
P. May (Dulwich, S.E.)
R. W. Orme (Oldham)
G. E. Dunnage (Worcester Park)
J. Carey (London, S.W.)
A. H. Brownrigg (East Dulwich Grove, S.E.)
T. H. Hill (Hale)
H. L. Hicks (Newcastle-on-Tyne)
G. B. Wills (London, E.C.)
R. B. Ling (Lavender Hill, S.W.)
A. J. T. Abel (Clapham, S.W.)
A. Rusbridge (Reading)
R. C. Young (Bristol)
W. Pritchard, junr. (Lancaster)
A. P. Hartnell (Bristol)
S. Birkett (Manchester)
C. H. Simpson (London, W.C.)
W. Whitehead (Leeds)
C. R. Corfield (Falmouth)
T. S. Rushworth (Clapham Road, S.W.)
L. S. Nicholls (Birmingham)
J. P. Salvey (Reading)
J. H. Vaughan (Ilford)
H. Healey (Manchester)
C. P. Walgate (Beverley)
C. W. Clark (Plymouth)
W. H. Harral (Leicester)
A. E. L. Bower (Liverpool)
W. R. Webster (Aberdeen)
G. H. Rowledge (Manchester)
J. G. Young (Alloa, N.B.)
F. E. Collington (Nottingham)
H. G. Warlow (Sheffield)
C. B. Maltby (Leicester)
C. L. Reinmann (St. Leonards-on-Sea)
C. L. Wright (West Kensington)
P. Caminsky (Manchester)
G. H. Goldsmith (Manchester)
C. H. White (Bristol)
A. H. Fitzroy (Lincoln)
G. Colles (Cheadle Hulme)
A. N. Cotterell (Bristol)
J. J. Crowe (Bradford)
A. H. Douglas (Maida Vale, W.)
A. Dunn (Gloucester)
W. H. Ellison (North Barnsley)
C. G. Fullford (Salisbury)
C. Groves (Chester-le-Street)
W. Guthrie (Clapham, S.W.)
A. W. Hall (Ealing)
W. F. Helm (Glasgow)
R. C. Hunter (Edinburgh)
M. Idle (Clapham, S.W.)
W. I. Keir (Melksham)
F. G. Leonard (Chatham)
H. Y. Margary (Upper Tooting, S.W.)
E. S. Petch (Scarborough)
H. M. Pett (Brighton)
R. A. H. Phipp (Trowbridge)
C. V. Ponder (Hastings)
C. A. Reed (Clapham Common, S.W.)
W. Rose (Cardiff)
H. R. Sayer (Peckham, S.E.)
J. H. Sayner (Harrogate)
G. S. Twizell (Newcastle-on-Tyne)
H. Unwin (Bolton)
F. J. Watson (Forest Gate)
F. C. Webster (Broughty Ferry)

Final.

The final and special examinations, qualifying for candidature as Associate R.I.B.A., were held in London from June 23rd to 30th. Of the seventy-four candidates examined, twenty-one passed and the remaining fifty-

three were relegated to their studies. The successful candidates are as follows:—

* L. N. Barrett (Harrow)
A. A. Carder (Clapham Common, S.W.)
* O. S. Doll (Lancing)
G. L. Elkington (London, E.C.)
G. F. Ely (Liscard)
C. L. Fleming-Williams (Clapton, N.E.)
J. L. Fouracre (Plymouth)
L. U. Grace (London, W.C.)
W. C. Le Maître (London)
J. H. Markham (West Hampstead, N.W.)
L. T. Moore (Great Yarmouth)
V. Myer (London, W.C.)
J. J. S. Naylor (London, W.)
H. Prince (London, E.C.)
W. D. Quirke (Hove)
* E. Reid (Sunderland)
* Percy Robinson (Leeds)
S. Searle (Harrow)
N. Thomas (London, N.W.)
J. W. Walker (Aberdeen)
W. E. Watson (London, S.W.)

The following table shows the number of failures in the Final examination:—

I. Design - - -	40
II. Mouldings and Ornaments - - -	37
III. Building Materials - - -	19
IV. Principles of Hygiene - - -	16
V. Specifications - - -	22
VI. Construction: Foundations, &c. - -	19
VII. Construction: Iron and Steel, &c. -	27

* The candidates to whose names an asterisk is prefixed entered for the Special Examination, which is for architects in practice not less than twenty-five years of age, and chief assistants over thirty. Such candidates are exempted, by special resolution of the Council, from the Preliminary and Intermediate examinations, and from submitting Testimonies of Study.

TWO GREAT NEW STREETS.

CONSIDERABLE interest has been evinced during the past week by the publication of the first of the eight volumes embodying the report of the Royal Commission on London Traffic. A very large number of recommendations are made by the Commission, but undoubtedly the most important are those relating to the construction of two great new thoroughfares running across the metropolis from east to west and from north to south, and the drafting of a comprehensive building plan for the important streets and main roads leading out of London—a matter to which we have often drawn attention. The two great thoroughfares are suggested to be made 140ft. wide, the one—4½ miles long—connecting the Bayswater Road with Whitechapel, passing through the City near London Wall, and the other—4½ miles long—connecting Holloway with the Elephant and Castle, passing by a new bridge across the Thames near the western boundary of the City. It is proposed that there shall be four lines of tramways on the surface and four lines of railways a few feet below the surface; these latter, constituting shallow tramways, being regarded by the Commission as preferable to tube railways. The east and west thoroughfare is estimated to cost £15,550,000 and the north and south thoroughfare £8,550,000. The Commission recommend that new streets or widened streets should be laid out according to the following standard of width from house to house, depending upon their importance and the degree to which they are likely to attract traffic:—Main roads, 140ft.; first-class arterial streets 100ft.; second-class streets, 80ft.; third-class streets, 60ft.; fourth-class streets, 40ft. or 50ft. A viaduct is suggested to be formed over Ludgate Circus and another across the Strand at the foot of Wellington Street, while a sunken road is proposed under Piccadilly from Berkeley Street to St. James's Street.

Competitions.

Public Elementary School, Leigh, Lancs.—A short time ago the Leigh Corporation invited fourteen architects to send in designs for proposed elementary schools, and on the nomination of the president of the Royal Institute of British Architects, Mr. Mervyn Macartney was appointed assessor. He made his award as follows:—1st, Mr. J. C. Prestwich, of Leigh; 2nd, Mr. Thornley, of Wigan and Darwen; 3rd, Messrs. Potts, Son & Hennings, of Manchester and Bolton. The estimated cost of the schools is £9,000 and the accommodation is for 900 children.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Book on Quantities.

MANCHESTER.—QUANTITIES writes: "Please name a good book on the above. Is the examiner in quantities, City and Guilds of London Institute, the author of a book on the subject? Please give his address."

"Quantities and Quantity Taking," by W. E. Davis, 3s. 6d. post free from these offices. The examiner in quantities at the City and Guilds of London Institute is Mr. F. S. Henniker, who can be addressed at the Institute premises, Exhibition Road, South Kensington. So far as we know he is not the author of any book on quantities.

Contract Signing.

SALTERHEBBLE, HALIFAX.—DOUBTFUL writes: "If a partner, manager or other representative of a firm comes to sign a contract, is it sufficient and binding on his firm if he signs the name of the firm he represents; if not, what additional precaution should be taken?"

The signature of a partner will bind his firm, but not the signature of a manager or other representative unless specially authorized to sign contracts. F. S. I.

Stresses on Roof Truss.

LONDON.—A REGULAR READER writes: "Please give a stress diagram for the truss shown by the accompanying drawing."

The frame diagram (Fig. 1) and stress diagram (Fig. 2) are for vertical loading, with an allowance of 56 lbs. per ft. super. for total load. For a roof of this character it is quite sufficient to consider vertical loading only, but the action of the wind on one side will be found fully discussed and the stresses worked out in the writer's "Wind-pressure on Roofs" (Spon, 6d.) This truss is one that presents some difficulty in the construction of the stress diagram, but by first using the

substituted member *a b* (Fig. 1) points *a* and *b* may be found in the stress diagram, when $4 - a$, $14 - a$, and $a - b$, $5 - b$ fix point 15 by continuation through *a*, and point 17 at *b*. HENRY ADAMS.

Stresses in Roof Truss due to Expanded Metal Ceiling.

H. G. V. O. writes: "I send tracing (re-drawn) showing a roof truss. I desire to know the stress in the various bars due to the weight of an expanded metal ceiling (10 lbs. per ft. super.) fixed to the tee-rod. Please show what are the loads at the joints, and give a lettered stress diagram showing the stress at the bars."

The stresses in the roof truss due to the weight of ceiling at 10 lbs. per sq. ft., principals being placed roft. apart, is shown on this page, together with a stress diagram showing how the stresses were obtained. It will be noticed that the stress in *i-j* is zero. *c* indicates compression and *t* tension. Stresses are given in lbs. These stresses do not include those due to roof load or wind load, nor bending caused by the weight of the ceiling. In dimensioning the members of the truss, stresses due to roof, wind and ceiling loads should be added together, and to this should also be added the stresses caused by bending, which will be found by the formula below. The sum of the stresses should not exceed $7\frac{1}{2}$ tons per sq. in. Fibre stress due to bending is $f = \frac{w \times L}{8 \times s}$, where *w*

is the uniformly distributed load on one member in lbs., *L* = length of member in inches, *s* = section modulus of the cross-section of the member in inches³. S. N.

Course of Art Study.

BRADFORD.—J. D. writes: "Which is the best school of art to which I could send a young lady to continue her studies? She has got as far advanced as the facilities of a small Northern town will carry her, and I should like your advice as to whether London or Paris is best, and the probable expenses which such a course of study would entail."

There are many excellent schools of art in London, such as the Royal Academy School, the Westminster, the Lambeth, the London County Council School of Arts and Crafts, and the Royal College of Art at South Kensington. At these instruction equal to that given in Paris is given, though of course there is an atmosphere around the Ecole des Beaux-Arts which does not exist in London. It is impossible to state the probable cost, as everything depends on the particular school you favour and the length of time to be occupied in studies. You should write to the principals at the schools of arts named above. You will find particulars in "The Year's Art" (3s. 6d.).

Firing of Brick Clay.

FILEY.—R. W. S. writes: "Kindly give some information, or name a book in which I can find it, as to the temperature required to reduce good brick clay and sand to a molten condition, and the density and strength of the compound."

It is impossible to give a precise answer to your question because one clay will melt at 1,800 degs. Fahr., while another will not melt at 2,800 degs. If you wish to have some clay tested as to fusibility we suggest that you send a sample to Professor Arnold, of the Technical College, Sheffield. The fee, we believe, is three guineas.

Covenant in Building Lease.

BIRMINGHAM.—SUBSCRIBER writes: "B and C (separate builders) take adjoining plots of land on lease from A (a freeholder). The lease of each contains a covenant that the lessee shall erect a certain number of houses the prime cost of each of which shall be not less than £300, exclusive of outbuildings. B builds and sells for £310 per house without 'improving' the ground rent, and yet makes a good bargain. The inference is that B has not complied with the above covenant, and the appearance of the houses tends to confirm this. The proof, however, is difficult. C adheres strictly to the letter of his covenant, and now experiences difficulty in selling his houses owing to the competition of B's houses. Has C any right of action against freeholder, or can he force the latter to call for an account from B to prove that the minimum has been expended?"

C has no remedy against B because there is no privity of contract existing between them, and unless A has agreed and covenanted with C that he will not allow any houses of a less value than £300 each to be built on B's plot he is not liable to C for anything that B does. If A has broken any promise in his agreement he is liable to C for damages sustained by C as a natural consequence of such breach. Let C look carefully into his agreement and correspondence to see whether A at any time promised that no houses of less value than £300 should be built on contiguous plots to his. If so, let him enquire again as to the position, stating the facts fully. S. P. J. M.

THE STATUTORY ENROLMENT OF ARCHITECTS.

Draft Bill of the Institute.

THE Registration Committee of the Royal Institute of British Architects has just issued its report and draft Bill for the Statutory Enrolment of Architects, given in full in the Institute "Journal" for July 22nd. This committee, consisting of the council of the Institute and representatives of the allied societies, was appointed in January last year, and a sub-committee in October last. In its report the committee recommends that the Institute examinations should be made compulsory on all intending architects, and the Bill has been drafted (by the solicitors to the Institute, and settled by Mr. Cripps, K.C., and Mr. Clode) with that object in view.

In the matters of architectural training and education it is suggested that the scheme of the Board of Architectural Education might be taken as a guide for any further steps contemplated by the Institute.

The Objects of the Bill

are as follows:—

(a) To enable persons requiring professional aid in the design and construction of buildings to distinguish qualified from unqualified practitioners, and to prevent untrained and incompetent persons, styling themselves architects, from imposing on the community to its material loss, danger and detriment.

(b) To confine the use of the title "architect" to persons enrolled under the provisions of the Bill, and also to provide for the maintenance of a register of all such qualified persons.

(c) To create an Administrative Board of Architects, composed of the council of the Institute, representatives of the societies of architects other than the Institute, and also representatives (not exceeding ten) of universities, institutes and other bodies which the Privy Council may determine to be entitled to representation; such Board to regulate the conduct of examinations, the issue and cancellation of certificates, and the removal or restoration of names from and to the register, and generally to exercise disciplinary power over all architects with the object of promoting their efficiency and usefulness: any rules framed by the Board to be valid only if approved by the Privy Council.

The promoters point out that they do not limit or in any way affect the right of those persons practising as surveyors or as builders from exercising their respective callings in as ample a manner as heretofore, so long as they do not use the title of "architect."

The Bill is divided into twenty-two clauses.

When Enrolment Begins.

Clause 1 sets out that after July 1st, 1907, no person shall describe himself as an architect, whether by advertisement, by description on his place of business, by any document issued by him, or otherwise, unless he is enrolled: and further enacts that anyone describing himself as, or inducing people to believe he is, an architect without being enrolled is liable to a fine not exceeding £20 and to be restrained by injunction or interdict from continuing to use the term "architect." Partnerships societies or other associations of persons carrying on business under a common name, whether corporate or incorporate, are not to be entitled to be enrolled.

Provision for Persons now Qualified.

Clause 2 enacts that any person who within one year from the date of the Act coming into operation claims to be enrolled shall be so enrolled, provided—

(a) He is either a Fellow or an Associate of the Institute, or, being a member of any one of the allied societies, or of the Society of Architects, or of the Ulster Society of Architects, was at the passing of the Act in *bonâ-fide* practice as an architect; or

(b) Has obtained by examination and holds a degree in architecture conferred by any university within the United Kingdom, or has such other qualification as may be approved by the Board; or

(c) Proves to the satisfaction of the Board that at the passing of the Act he had been for at least two years engaged as a principal in the *bonâ-fide* practice of architecture, or

had served for ten years as pupil, apprentice or assistant, or partly as one and partly as the other, to a person or persons who at the passing of the Act is or are entitled to be enrolled.

Qualifying Examination for Enrolment.

Clause 3 enacts that subject to the provisions of clause 2 no person shall be entitled to be enrolled as an architect unless he has served as apprentice or assistant, or partly as one and partly as the other, for not less than five years with a person enrolled or entitled at the passing of the Act to be enrolled, and has passed and produces to the registrar a certificate under the seal of the Board that he has passed such examinations as to his knowledge of architecture and of the practice and duties of an architect as the Board shall from time to time prescribe: provided always that any person who has passed all the examinations required to be passed for membership of the Institute shall, subject to the provisions of the Act, be entitled to enrolment without further examination.

Constitution of Administrative Board.

Clause 4 states that after the passing of the Act, and notwithstanding anything contained in any charter or by-law of the Institute, there shall be added in each year to the council only one person if nominated by the Royal Institute of the Architects of Ireland, one person if nominated by the Architectural Association of London, one person if nominated by the Society of Architects, one person if nominated by the Ulster Society of Architects, the presidents of such of the allied societies as may not for the time being be represented upon the council, and such other persons (not exceeding ten in number) as may be nominated by any such universities, institutes, societies, associations and bodies (other than the Institute and allied societies) as the Privy Council shall from time to time determine to be entitled to representation: any vacancy occurring by resignation or death amongst the persons nominated under the foregoing provisions to be filled up by the body nominating such person, and the original and any subsequent nominees, at the termination of the period for which they have been appointed, to be eligible to be renominated.

Duties of Administrative Board.

Clause 5 states that the council and the persons added thereto under the provisions of clause 4 shall together form the Administrative Board of Architecture; and sets forth their duties and powers, which embrace the course of training, the subjects for examination, the issue of certificates, &c., and the removal from the roll of anyone contravening the provisions of the Act, and also the restoration to the roll of any architect so removed.

The Roll.

Clauses 6, 7, 8 and 9 relate to the keeping, by a registrar, of the roll of architects, which is to be published every year on or before January 31st (in 1907 at as early a date as possible). Clause 10 enacts that the Board may direct the registrar not to enrol any person who is proved to have been convicted of any offence which if committed in England would be a felony or misdemeanour, to have been declared by any court of competent jurisdiction to have committed any fraud, or to have been guilty of disgraceful professional conduct: provided that one month's notice be given to the person charged, so as to give him an opportunity of defending himself.

Removal of Names.

Clause 11 enacts that the registrar shall remove a name from the roll (a) at the request or with the consent of the person whose name is removed, (b) when the enrolled person is dead, or (c) when required so to do by the Board; and shall from time to time insert in the roll any alteration which may come to

his knowledge in the name or address of any person enrolled.

By clause 12 it is enacted that the Board may direct the registrar to remove a name from the roll when it has been incorrectly or fraudulently entered; when the person enrolled shall be convicted of felony, misdemeanour, fraud or disgraceful professional conduct (as in clause 10); or when the person enrolled enters into any other business or occupation not in the opinion of the Board incident to or consistent with that of an architect: provided always that one month's notice is given as in clause 10.

Appeal

from the decision of the Board is provided to be made (clause 13) to the High Court of Justice within three months after the notification of such decision; but no further appeal.

Clause 14 makes provision for the restoration of names removed from the roll, this being at the discretion of the Board, and either with or without the payment of a fee, as the Board shall decide.

The Fees

to be paid are spoken of in clause 15 as "such reasonable fees . . . as the Privy Council may from time to time . . . direct and fix, with a view to meeting the expenses incurred by the Board and the Institute in the administration of this Act." A schedule of fees is appended to the Bill as follows:—

Nature of Fee.	When to be Paid.	To whom to be Paid.
For enrolment of name of architect under provisions of section 2.	On application and before enrolment.	To the registrar of the Institute.
For enrolment of name of any person other than as above.	Ditto.	Ditto.
Annual fee to be paid by every enrolled architect taking out a practising certificate.	On or before November 30th of each year in respect of the year commencing January 1st following.	Ditto.
On entry of any candidate for final qualifying examination.	At time of entering	Ditto.
On entry of any candidate for any examination other than as above.	Ditto.	Ditto.

Clause 16 enacts for what purposes the fees are to be used, these purposes being as stated in clause 15 and "in promoting and facilitating the acquirement of the knowledge of such of the various arts and sciences connected with civil architecture as the Institute may from time to time determine."

A financial statement showing the receipts and expenditure, including liabilities, of the Board and the Institute under this Act is directed to be published as soon as possible after December 31st every year.

Clauses 17 and 18 specify penalties for making, or helping to make, false representation or declaration in obtaining a certificate of enrolment, such action being punishable by imprisonment not exceeding twelve months.

Scale Fees.

Clause 19 sets forth that from the date of the Act coming into operation the charges for professional services to be made by enrolled architects are to be those to be comprised in a schedule to the Act, or such other scale of charges as may be sanctioned by the Privy Council, and no persons other than those enrolled and holding practising certificates are to be entitled to practise as architects or to recover the above or any charges for services rendered in the capacity of architects: "provided that nothing herein contained shall prejudice the right of professional members of the Institution of Civil Engineers or Surveyors' Institution to recover charges for

work of any kind falling within the duties of their respective callings."

Clause 20 states that the Act is not to apply to naval architects; clause 21 defines the terms "council," "Institute," "allied societies," "architect" and "Board"; and the last clause, 22, gives the title of the Act, which may be cited as the Architects' Act, 1906, to come into operation on July 1st, 1907.

THE CHEAP COTTAGES EXHIBITION.

YESTERDAY the Cheap Cottages Exhibition at Letchworth (Garden City) was opened by the Duke of Devonshire. As our readers no doubt are aware, this exhibition is the outcome of a suggestion made by Mr. J. St. Loe Strachey, editor of the "Spectator" and proprietor of the "County Gentleman," who published a series of articles on the subject, and afterwards had the gratifying offer from the First Garden City, Ltd., of a site on which cottages could be built without being subjected to unduly stringent by-laws, and which, moreover, might not have to be pulled down at the close of the exhibition. Great interest has been evinced in the scheme, and to-day there is the collection of cheap houses to be seen on the estate at Letchworth. Next week we hope to give some photographs and plans of the most interesting of these, but meanwhile we may state a few particulars.

The Prizes Offered.

The primary object of the exhibition is to secure the erection of the best £150 cottage, and a first prize of £100 is offered for this exhibit. It was desired that the cottages should be detached and provided with one living-room and scullery, or kitchen-scullery, and three bedrooms (provided with two fire-places) having a cubic space of 2,000ft.—the rooms to be not less than 7ft. 6ins. high.

Other prizes offered are for the best pair of five-roomed cottages (including scullery or kitchen-scullery) erected at a cost not exceeding £300; for the best group of three or four cottages, no one cottage to contain more than six rooms, including scullery, and erected at a cost not exceeding £35 per room; for the best detached cottage or pair of cottages, each containing not more than six rooms, including scullery, and erected also at a cost not exceeding £35 per room: the estimated cost in every case to be exclusive of architect's fee and builder's profit.

Prizes are also offered for the best design and specification for a detached labourer's cottage costing not more than £150; a pair of five-roomed cottages costing not more than £300; a group of three or four cottages, no cottage containing more than six rooms (including scullery), costing not more than £35 per room; and a detached cottage or pair of cottages, each containing not more than six rooms (including scullery) and costing not more than £35 per room.

A prize of £100 (given by an anonymous donor) is also offered for the cheapest cottage in the exhibition, the judges having discretion as to the compatibility of cheapness with soundness of building and suitability for a rural labourer and his family; a prize of £50 (given by the Associated Portland Cement Manufacturers, Ltd.) for the best cottage built of cement-concrete; a prize of £50 for the best wooden cottage; a special prize of £10 (given by Mr. H. G. Elwes, F.R.S.) for the best design and specification of a wooden cottage to be constructed entirely of English timber; and a special prize of £10 (given by the Co-operative Small Holdings Society) for the best model of a small holding.

Prizes are also offered for the best invention or improvement in building materials and fittings calculated to improve, cheapen or facilitate the erection of cottage property.

Among the cottages erected are some by

the following architects:—Geoffrey Lucas, C. M. Crickmer, Henman & Cooper, C. S. Ingham, Percy Houghton, Stanley Barrett & Driver, Lionel F. Crane, H. Cayley, Richard Whitbread, Bennett & Bidwell, Harry Prince, Allen Foxley, Curtis Green, C. G. Agate, W. Moss Settle, Harrison & Hattrell, V. Dunkerley, Baker & May, George E. Clare, W. Taprell Allen, Baillie Scott, John A. Brodie, Hesketh & Stokes, R. Johnston, T. H. James, A. Randall Wells, F. W. Troup, Smith & Brewer, W. Marshall and Miss E. McClellan (for the Society of Artists).

In addition there are cottages by numerous builders and—

J. A. King & Co.	Concrete Machinery Co., Ltd.
British Uralite Co., Ltd.	Wire-weave Roofing Co.
Fireproof Partition and Spandrel Wall Co.	British Metallic Roofing and Constructional Co.
Asbestos Brick & Tile Co., Ltd.	Potter & Co., Ltd.
New Expanded Metal Co., Ltd.	John McManus.
	Cement Products Co.

The judges of the exhibition are Sir Walter Lawrence, Mr. Thackeray Turner, Prof. W. R. Lethaby, Mr. R. Weir Schultz, Miss Octavia Hill, Miss Yorke and Prof. Sims Woodhead (sanitary).

How to get to the Exhibition.

For the convenience of readers who wish to visit the exhibition we may state that the Great Northern Railway Co. issue return tickets at 2s. 6d. third class (including entrance to the exhibition) from King's Cross. Trains leave King's Cross at 9.0, 11.10, 3.10 and 6.18, and trains leave Letchworth at 8.33, 10.19, 2.28, 4.57, 7.0 and 7.31. About fifty-five minutes is occupied by the journey each way.

Keystones.

A new Mortuary at Newport is to be erected opposite the rear of the town hall.

Mr. John W. Simpson, F.R.I.B.A., and Mr. Maxwell Ayrton, A.R.I.B.A., have been appointed architects to the Royal Society of Painters in Water-colour.

Taunton School: London Old Boys' Club.

—An up-river trip has been arranged for Saturday, August 12th, leaving Paddington at 1.50. The price of tickets (inclusive) is 8s. each. Applications must be made on or before July 29th to the secretaries at 28, Princes Avenue, Church End, Finchley, N.

The Usher Hall still under discussion.—The Lord Provost's Committee of the Edinburgh Town Council resolved last Wednesday that a special meeting of the town council should be summoned for September 5th, when the whole question of the Usher Hall would be considered.

Northern Architectural Association.—Mr. Archibald Dunn, J.P., past-president, of Bournemouth, has sent Mr. Arthur Plummer, the hon. secretary of this Association, a cheque for £50 towards the Permanent Premises Fund. The alterations and improvements to the new premises of the Association in Higham Place have been satisfactorily completed.

Sixteen Municipal Cottages built at a cost of less than £150 each have been opened at Southwold. Each house contains three bedrooms, a living-room and kitchen, with garden at the back. They are of red brick, with red tile roofs, and are fitted up with larder, coal store and two cupboards. The contract price for the sixteen houses was £2,395. The rent is to be 4s. weekly.

The new Municipal Buildings at Crewe were opened last week. They occupy a site adjoining the Market Hall in Earle Street. The front is of fine white stone, and over the principal entrance are figures representing the advance of shipping and commerce, mechanics (especially with regard to engine building), and the textile and chemical industries. The approximate cost of the buildings is £20,000. Mr. Henry T. Hare, F.R.I.B.A., was the architect.

Deptford's new Town Hall is of Portland stone throughout, and has a striking façade carrying a frieze depicting a naval battle. Nautical emblems are carved all about the building, which is surmounted by a clock tower. The council-chamber is on the first floor at the front; while at the back and underneath, ranged round a fine pillared hall, are the various offices of the Corporation officials. The architects were Messrs. Lanchester & Rickards.

New District Baths for Bradford.—On Wednesday last two of the series of district baths in course of erection in various parts of Bradford were formerly opened. These serve the township of Bowling and are in Leeds Road and Wakefield Road. Both have been designed by the city architect, Mr. F. E. P. Edwards, A.R.I.B.A. The cost of the Leeds Road baths has been £7,934 (including £1,123 for the site) and the Wakefield Road baths £7,000.

Messrs. J. G. White & Co., Ltd.—An issue of 5,000 six per cent. cumulative preference shares in this well-known firm of tramway and general engineering contractors is being made. Particulars will be found on p. xix of this issue. The company does not manufacture, but purchases its supplies in the open market. It is therefore very lightly capitalized and in the most favourable position for securing certain classes of remunerative contracts. An interesting and promising feature is the equal association of the company with Waring & Gillow, Ltd., in the Waring-White Building Co., Ltd.

A.A. Prizes.—The prizes in the Architectural Association day and evening continuation schools were awarded on Friday afternoon by the president, Mr. E. Guy Dawber, F.R.I.B.A. The following is a list of the prize-winners:—*First Year Awards.* Mr. E. Stanley Hall, book prize for first place in history and construction tests; Mr. V. C. Batalha Reis, A.A. sketch book for first place in freehand drawing tests; Mr. M. S. R. Adams, book prize for best work in studio during whole session; Mr. W. J. Jones, master's prize for essay. *Second Year Awards.* Mr. W. W. Scott-Moncrieff, travelling studentship awarded for studio work during session 1904-5, holiday work during three vacations, and general progress; Mr. F. T. W. Grant, extra studentship awarded for general excellence in studio and holiday work. Design placed first, Mr. F. T. W. Grant, end of session test, special prize offered by Mr. H. P. G. Maule, subject "A Village Hall," award made by Mr. E. Guy Dawber; bracketed second, Mr. A. G. Blackford, Mr. H. I. Merriman, Mr. W. W. Scott-Moncrieff; third, Mr. A. N. Peckham. Mr. H. I. Merriman, prize for studio work and excellence in draughtsmanship. *Evening Continuation School.* Book prize for general work, Mr. Arthur Walford; second place, book prize, Mr. J. K. Ground.

PUBLIC HEALTH CONGRESS.

DURING the past week a congress of the Royal Institute of Public Health has been held in London, at which a number of papers of interest to architects, surveyors and others have been read. So far as architects are concerned, perhaps the most interesting were those on the planning of schools, by Mr. E. R. Robson and Mr. T. J. Bailey (L.C.C.); those on ventilation by Mr. J. H. Blizard and Mr. E. G. Rivers (chief engineer, H.M. Office of Works); and one or two on smoke abatement. We have reports of these papers in hand, but regret that owing to pressure on our space we are obliged to hold them over till next week, when we hope to give also a summary of some other papers read at the Congress.

Complete List of Contracts Open.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
BUILDING:			
July 27	Prestwich—Wall	Guardians	T. Worthington & Son, 66 Brown Street, Prestwich.
" 28	Birmingham—Depôt	Corporation	Harris & Harris, 9 Bennett's Hill, Birmingham.
" 28	Pontypool—Chapel	Urban District Council	D. J. Lougher, Bank Chambers, Pontypool.
" 28	Walsall—School	Education Committee	Bailey & McConall, Bridge Street, Walsall.
" 28	Pontnewynydd, near Pontypool—Villa	Mr. J. Amery	D. J. Lougher, Bank Chambers, Pontypool.
" 28	Normanby—House	Dr. Townsend	R. Lofthouse & Sons, 62 Albert Road, Middlesbrough.
" 29	Lincoln—School	Governors	E. C. Pinks, Parliament Mansions, Victoria Street, S.W.
" 29	Rathfriland—Renovation of Church	Industrial Co-op. Society	D. Murphy, Newry Street, Rathfriland.
" 29	Widnes—Premises	Visiting Committee	Society's Offices, 406 Church Street, Runcorn.
" 29	Cardigan—House, &c.	Guardians	Vale of Teivy Co-operative Society's Stores, Cardigan.
" 29	Newcastle-on-Tyne—Alterations to Kitchens, &c.	Guardians	City Property Surveyor's Department, Town Hall, Newcastle-on-Tyne.
" 29	Stockton-on-Tees—Alterations to Laundry	Guardians	J. Rodham, 16 Finkle Street, Stockton-on-Tees.
" 29	Bradford—Conversion of Hospital Block into Infirmary Block.	Guardians	F. Holland, 11 Parkinson's Chambers, Hustlergate, Bradford.
" 29	Cilgerran, Wales—Repairs at School	Education Committee	J. Williams, Gwynfryn House, Cilgerran.
" 29	Weston-super-Mare—Additions to School	Education Committee	Samson & Cottam, 43 High Street, Bridgwater.
" 29	East Coker—Classroom, &c.	Education Committee	A. J. Pictou, Bruton, Somerset.
" 31	Keighley—Alteration to School	Urban District Council	J. Vickers-Edwards, County Hall, Wakefield.
" 31	Barry—Hospital	Guardians	J. C. Pardoe, 160 Holton Road, Barry.
" 31	Dudley—Conversion of Washhouse into Ward	Education Committee	A. Marshall, King Street, Nottingham.
" 31	Newcastle—School	Guardians	County Surveyor's Office, Moothall, Newcastle.
" 31	Tattingstone, Suffolk—Repairing Exterior of Workhouse	Education Committee	A. J. Haward, Princes Street, Ipswich.
" 31	Silsden, near Keighley—Additions to School	Education Committee	Education Offices, County Hall, Wakefield.
" 31	Stepney, E.—Extension of Library	Council	M. W. Jameson, 15 Great Alie Street, Whitechapel, E.
" 31	Emyvale, Monaghan—Dispensary	Guardians	W. A. Scott, 74 Holly Bank Road, Drumcondra.
Aug. 1	Ballymoney—Technical School	Governors	J. A. Hanna, Ocean Building, Belfast.
" 1	Buckingham—New Royal Latin School	Education Committee	Town Hall, Buckingham.
" 1	Carlisle—School Buildings	Guardians	A. H. Collingwood, 15 Fisher Street, Carlisle.
" 1	Ulverston—Alterations to Hospital	Commissioners	Cottage Hospital, Ulverston.
" 2	Dublin—Residence and Dispensary	Commissioners	J. O'Neill, Clerk's Office, North Brunswick Street, Dublin.
" 2	Paddington, W.—Extension of Laundry, &c.	Commissioners	F. J. Smith, Parliament Mansions, Victoria Street.
" 3	Crieff, N.B.—Post-office	Commissioners	Postmaster, Crieff.
" 4	London, E.—Additions at Shoreditch County Court	Fish Oil & Guano Co.	J. B. Westcott, H.M. Office of Works, Storey's Gate.
" 4	Southwold—Sea Defence Works	Education Committee	E. R. Cooper, Town Clerk, Southwold.
" 4	Bonnybrake, N.B.—Works	Town Council	Carmichael & Sharman, 12 Queen Street, Edinburgh.
" 4	Nantymoel—Alteration to Chapel	Guardians	W. B. Rees, 3 Dumfries Place, Cardiff.
" 5	St. Erme, Cornwall—Piggery, &c.	Education Committee	Farmhouse, Tregasson, St. Erme.
" 5	Sheffield—School	Town Council	Secretary, Education Committee, Education Offices, Sheffield.
" 7	Partick—Fire-brigade Station	Guardians	J. Miller, 15 Blythswood Square, Glasgow.
" 8	Newton Abbot—Nursery	Education Committee	S. Segar, Union Street, Newton Abbot.
" 9	Dungarvan, Ireland—Cells, &c.	Corporation	Office of Public Works, Dublin.
" 12	Wallsall Wood, Staffs—School	Urban District Council	G. Balfour, Director of Education, Stafford.
" 12	Ryde, Isle of Wight—Cottages	Guardians	Borough Engineer, Town Hall, Ryde.
" 15	Hampton, Middlesex—Fire-station, &c.	Urban District Council	S. H. Chambers, Public Offices, Hampton.
" 16	Barnet, Herts—Additions to Workhouse	Guardians	White, Son & Pill, 13 High Street, Barnet.
" 16	Fernhurst, near Haslemere—House	J. Caesar	M. Childs, Bridgeland, Fernhurst.
ENGINEERING:			
July 27	Ladywell, Berwickshire—Pump, &c.	Urban District Council	J. & A. Leslie & Reid, 72A George Street, Edinburgh.
" 28	Portland, Dorset—Tar Washer	Rural District Council	Corbet Woodall & Son, Palace Chambers, Westminster, S.W.
" 28	Chelmsford—Laying Pipes	Corporation	J. Dewhurst, Avenue Chambers, Chelmsford.
" 28	Hull—Supply and Fixing of Constructional Steelwork	Education Committee	City Architect, Town Hall, Hull.
" 29	Lydbrook—Culvert	Corporation	M. H. Medland, 15 Clarence Street, Gloucester.
" 31	Stockport—Waterworks	Great S. & W. Ry. Co., Ltd.	E. Mansergh, 5 Victoria Street, Westminster, S.W.

Trade and Craft.

Stained-Glass, Casements, &c.

We have received from Messrs. Abbott & Co., of St. John's Studio, Lancaster, a well-illustrated catalogue of stained- and leaded-glass windows, memorial brasses, casements and frames, and cast leadwork, &c. As in other branches of design, a great change has been effected in respect to stained-glass windows, and we see a greater appreciation of the purely decorative treatment both in figure and floral subjects. A number of the designs in this catalogue are reproduced in colour and show to good advantage. They are carefully worked out, and the plainer designs especially are very pleasing. Some fine drawings are given of a series of four windows depicting "The Woman of Samaria" erected in a church at Blackburn, and six others out of a series of fifteen erected at a church near Lytham; these latter representing Tyndale, Bunyan, Savonarola, Cromwell, Milton and Barrowe. In the execution of these windows only the finest and richest English Antique glass is used, and this secures the best results in the hands of skilled artists and colourists. Messrs. Abbott say they are always pleased to produce special designs for proposed windows, and where necessary will send a representative to interview intending donors or committees and give advice as to the most suitable subject and colour scheme. As it is of considerable convenience to architects, builders and others to be able to place in the hands of one firm the making of the window frames, casements, &c., as well as the stained or leaded glass with which they are to be filled, Messrs. Abbott have recently added this branch to their business, and a variety of sections for such frames and casements are given in their catalogue. The leadwork executed by them is represented

by a number of rainwater pipe-heads, ears, &c., several of which are of very good design.

The Plenum System.

It is generally admitted that Mr. W. Key was the first in this country to employ the plenum system of ventilation and warming on a commercial scale. More dispute, perhaps, has centred around the problems of ventilation than around any other subject connected with building, but in recent years especially it has become to be recognized that for the ventilation of a building occupied by a large number of persons the plenum system is the only one by which efficiency can be guaranteed. It relies upon mechanical means for its working, and as these mechanical means are under exact control a predetermined result can be obtained. Mr. Key (whose Glasgow address is 109, Hope Street, and London address 11, Queen Victoria Street) sends us a little pamphlet dealing with his system which is of interest to architects and others.

Builders' Notes.

The Dispute at Newcastle between the Master-Builders' Association and the Operative Bricklayers' Society still continues, the masters adhering to their proposals as to wages, apprentices, arbitration, overtime, &c.

Building in the United States continues active all over the country. The average increase over last year, which was itself a great year for building operations, is ranging from 25 to 30 per cent., or in money-figures the increase represents £340,000 to £400,000 per month in twenty-five of the principal cities of the States. The total volume of construction now under progress in the country represents no less a sum than £3,000,000 per month for the present building season.

At Kirton Grammar School, Lincolnshire, new heating apparatus has been supplied and fixed by Messrs. Sheen & Mills, of Bath Street Ironworks, Sheffield.

The Sanitary Inspectors' Association will hold its annual meeting and conference at the Carpenters' Hall, London Wall, E.C., from August 17th to 19th inclusive.

House Building at Blackpool.—In welcoming the members of the National Federation of Building Trades' Employers of Great Britain and Ireland, who held their summer meetings at Blackpool recently, the mayor (Alderman J. Brodie, J.P.) made an interesting statement as to the rapid growth and development of the town during the past ten years. In 1895 there were 531 houses built, in 1896 there were 744, the following year 984, while in 1898 the highest figures were reached—1,066. They seemed to go back a little after that, but still they were progressing. In 1899 there were 483 houses erected, 429 in 1900, 370 in 1901, 383 in 1902, 311 in 1903, and in 1904-5 (to June 30th), 454, making a total of 5,755.

The Cardiff Building Trade Dispute seems likely to be settled. The hitch is over the interpretation of a minute relating to the time of starting work during two weeks of the year, one before and one after Christmas. The masters had stipulated in writing for half an hour for dinner, the intention being that the men should start at 7.30 during the two weeks in question. The men have now submitted their reply, which is to the effect that they consider the offer they accepted was an equitable one and should be observed in honour by the masters, but in the alternative they are ready to take the full dinner hour during this period so as not to increase the aggregate number of hours worked in the week. A joint conference is to be held.

Sale by Tender.

THE DARLEY DALE AND DISTRICT STONE COMPANY, LIMITED.

FOR SALE.—The FREEHOLD WHARF (adjoining Darley Dale Station) with Siding, Saw Mills, Offices, &c. Quarries, Fixed Plant, Loose Plant, Stock in Trade, and Goodwill of the above Company by Private Treaty.

Tenders will be received for the whole of the above in one lot as a going concern or in lots to suit purchasers.

The highest or any Tender not necessarily accepted.

Full particulars with Inventory and Conditions of Sale to be obtained on or before Saturday, August 5th, 1905, of the Liquidator, W. J. BARTON, Incorporated Accountant, Bentinck Buildings, Nottingham.

Contracts Open.

ARMY CONTRACTS.

SALE OF SURPLUS BOILERS, DISTILLING APPARATUS, DYNAMOS, AND OTHER PLANT AT BERMUDA, BARBADOS, ST. HELENA, AND WOOLWICH.

The Secretary of State for War is prepared to receive Tenders for the purchase of surplus Boilers, Distilling Apparatus, Dynamos, and other plant now lying at Bermuda, Barbados, St. Helena, and Woolwich, most of which is in first-rate condition, some lots being unused.

Forms of Tender, giving full description of the plant, particulars as to condition of the several lots and terms of contract, may be obtained on application to the under-mentioned Office.

The Tenders are to be delivered at the War Office, Pall Mall, London, S.W., by TWELVE o'clock noon on 1st September, 1905.

War Office,
Pall Mall, S.W.
3rd June, 1905.

HAMPTON URBAN DISTRICT COUNCIL.

TO BUILDING CONTRACTORS.

The above Council invite TENDERS for the ERECTION of a FIRE STATION and READING ROOM on land situate at Hampton Hill.

The drawings and specification may be seen, and forms of Tender obtained of Mr. SIDNEY H. CHAMBERS, Surveyor to the Council, upon application made, accompanied by a deposit of £2, on or after the 24th instant.

The deposit will be returned after a bonâ fide Tender shall have been received and placed before the Council, and in the case of an accepted Tender after execution of the Contract and bond required, and failing such execution the deposit will be forfeited to the Council.

A clause will be inserted in the Contract providing that the Contractor shall pay to the workmen employed in the execution of the work the wages generally accepted as current for workmen engaged on similar work in the district.

Sealed Tenders, endorsed "Tender for Fire Station and Reading Room," to be delivered to me not later than FOUR p.m. on TUESDAY, the 15th day of AUGUST, 1905.

The Council do not bind themselves to accept the lowest or any Tender.

By Order,
EDGAR COZENS,
Clerk to the Council.
Public Offices,
Hampton, Middlesex,
20th July, 1905.

TO ENGINEERS and Others.

The Metropolitan Asylums Board invite TENDERS for ALTERATIONS to ENGINEERING ARRANGEMENTS, &c., in the LAUNDRY at the South-Eastern Hospital, New Cross, S.E., in accordance with drawings and specification prepared by Mr. W. T. HATCH, M.I.C.E., M.I.M.E., Engineer-in-Chief.

Drawings, specification, conditions of contract, and form of Tender may be inspected at the Office of the BOARD, Embankment, London, E.C., on and after JULY 24th, 1905, and can then be obtained upon payment of a deposit of £2.

The amount of the deposit will be returned only to persons who have sent in bonâ fide Tenders, and returned drawings and specification in accordance with the regulations.

Tenders addressed as noted on the form must be delivered at the Office of the BOARD not later than TEN a.m., on TUESDAY, 5th SEPTEMBER, 1905.

By Order,
T. DUNCOMBE MANN,
Clerk to the Board.
July 19th, 1905.

Privileges open to all Regular Readers of the "Builders' Journal."

I.—Free Monthly Advertisements.

1. A Free Advertisement of 12 words in the Wanted or Miscellaneous Advertisement Columns, in one issue of the BUILDERS' JOURNAL during each calendar month will be given to any regular reader.

2. The charge of one penny will be made for each additional word.

3. Advertiser's Name and Address or Box Number must be counted, but will in no case be reckoned as more than five words.

4. All advertisements must be accompanied by the correct remittance, and should a receipt be required a stamped addressed envelope must be enclosed.

5. The Proprietors reserve to themselves the right of refusing any advertisement.

II.—Free Answers to Enquiries.

1. The services of a large staff of experts are at the disposal of all regular readers who require information on architectural, constructional or legal matters.

2. Questions should in all cases be addressed to the Editor, and be written on one side of the paper only.

3. Correspondents are particularly requested to be as brief as possible.

4. The querist's name and address must always be given, not necessarily for publication.

Note.—Owing to the large number of enquiries we receive weekly, we are compelled to restrict the advantages of this department to Regular Readers.

III.—Free Accident Insurance of £500.

1. Every regular reader of the BUILDERS' JOURNAL is entitled to the benefit of this Insurance.

2. A Pamphlet giving full details of this and other Insurance schemes inaugurated by the BUILDERS' JOURNAL for the benefit of its readers, and guaranteed by "The Ocean Accident Corporation, Limited," will be sent on application.

What is a Regular Reader?

We have employed the term "Regular Reader" throughout these announcements as the description "subscriber" is often understood to mean one who subscribes direct to the publishing office.

We mean by a Regular Reader anyone who has placed an order with us or any newsagent or bookstall for the BUILDERS' JOURNAL for one year.

Those readers who order the BUILDERS' JOURNAL through their local newsagent or bookstall should send us the newsagent's receipt. Their names will then be placed on our subscribers' list, and they will be entitled to all the advantages set out above.

5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS.
OFFICE: 6, GREAT NEW STREET, FETTER LANE, E.C.

RICHLY CARVED DOORS carefully reproduced from old models can be made in any hardwood, possessing all the elegance and richness of figure and colour found in the antique examples.

ARCHITECTS are invited to inspect the specimen doors on exhibition to satisfy themselves as to the construction, quality and artistic merit. Sample doors can be seen at the Company's Showrooms, 53, Berners Street, London, W.

A GUARANTEE. The Gilmour Door Co., Ltd., will give a guarantee with all their doors that they will not warp, twist, split, shrink or crack. They are absolutely reliable.

COST. A well-made Hardwood Door can be obtained at prices varying from 35s. to £10.

CATALOGUE will be sent free on application to Dept. B.,

In various Designs

From 35/- to £10.

All the material used in the Framing of these Doors is put together as shown here.

The Interior "Core" is made in strips of selected pine with the grain reversed, and dried with 200 degrees of heat.

The Exterior Hardwood Facing is welded to the Core by means of immense pressure, making in effect one solid piece.

ROYAL WATERLOO HOSPITAL FOR CHILDREN AND WOMEN.

A SPECIAL appeal is being made for the Royal Waterloo Hospital for Children and Women, in Waterloo Bridge Road, London, S.E., to which we draw the attention of readers. The hospital was founded in 1816, and since then has afforded relief to more than a million poor patients, both children and women. A hospital was erected on the present site in 1823, and was subsequently enlarged; and though no doubt it was originally designed in accordance with the best knowledge then available, it is not surprising that in 1902 the building had become not only out of date from an architectural and sanitary standpoint but also in some respect an actual danger to the patients, by reason of the impossibility of keeping an old building, largely constructed of wood, free from injurious germs. This state of things was brought forcibly to the notice of the Board of Governors by their medical staff, who declared that it was absolutely necessary that immediate steps should be taken to rebuild the hospital. The work of rebuilding was therefore put in hand at once, and the greater portion of the new hospital has now been completed from designs by Messrs. Waring & Nicholson, of 38, Parliament Street, S.W. Messrs. Holliday & Greenwood, Ltd., were the contractors. The building, which is of red brick and terra-cotta, with a corner entrance porch in glazed ware—the gift of Messrs. Doulton & Co., Ltd.—is designed to contain 200 beds when the whole

hospital is finished, with a separate nurse home. The total cost, including furniture and apparatus, will exceed £50,000, and towards this rather more than £20,000 has at present been obtained. The cost of maintenance of the hospital when completed will probably be not less than £12,000 per annum, towards which there is only an assured income of £770 per annum, apart from subscription &c. An appeal therefore is made for funds which should be forwarded to the hon. secretaries of the Special Appeal Committee at 9, Regent Street, W.

New Companies.

WIMBLEDON COLOUR AND VARNISH CO., LTD. Mitcham and Wimbledon. In particular to acquire the recipes for and the right to manufacture and deal in certain substitute for turpentine known as "Turreps." Capital: £3,000.

ARTHUR LLOYD LTD., stone quarrymen and masons, Houghton, Lancs. Capital: £6,000.

PENGELUAN BUILDING CO., LTD., builders, contractors &c., Miskin, Mountain Ash, Glamorganshire. Capital: £5,000.

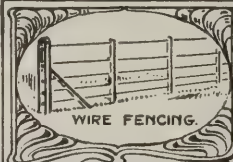

HUGH MCBRIDGE, LTD., plaster merchants, Belfast. Capital: £4,000.

HUDSON BROTHERS, LTD., carpenters, builders' merchants, &c., Llantrisant and Cardiff. Capital: £4,000.

THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

August 2, 1905. Vol. 22, No. 547.

6, Great New Street, Fetter Lane, E.C

Summary.

At the Cheap Cottages Exhibition at Letchworth (Garden City) are to be seen examples of cottages in brick, either left plain, rough-cast or whitewashed, and cottages of wood, concrete slabs, expanded metal, patent fire-resisting slabs and reinforced concrete. A number of representative examples are illustrated in this issue. (Page 58.)

A first premium of £600 and six other premiums of lesser value are to be offered in connection with the competition for the Palace of Peace at the Hague. (Page 66.)

The Royal Engineers' South African Memorial at Chatham, unveiled last week by the King, takes the form of an arch designed by Mr. E. Ingress Bell, F.R.I.B.A. (Page 66.)

Lord Wemyss, writing to the "Times" on the subject of ancient monuments in Westminster Abbey, deprecates the mutilation and removal of historic statues to make room for modern ones. (Page 72.)

The Goodyear Exhibition of Architectural Refinements, which was to have been held at Edinburgh this month, has, owing to the lack of time and the difficulty of getting the exhibits together, been postponed until September 5th. The exhibition will then be held in the National Portrait Gallery, Edinburgh. (Page 66.)

The amount of space per bed in work-houses required by the Local Government Board, irrespective of that occupied by doors and fireplaces, is as follows:—For aged infirm, 5ft. wall space and 50ft super. floor space; for able-bodied inmates, 4ft. and 34ft. respectively. (Page 71.)

In his paper on school planning read before the London congress of the Royal Institute of Public Health Mr. E. R. Robson, F.S.A., cited the new Bluecoat School at Horsham as an example of a poor site, owing to the subsoil, and *vice versa* that of Lancing College. Staircases, he advised, should be in short flights, no flight exceeding twelve steps, and of an easy gradient. The so-called French rule—namely, that twice the rise added to the tread should be equal to 24ins.—was perhaps the best. For artificial lighting he declared emphatically in favour of acetylene gas. (Page 67.)

Allegations of receiving commission from a builder were made at a meeting of the Marylebone Borough Council last week against one of the sanitary inspectors in the employ of the council. The builder alleged he had paid the inspector £240, and although the latter emphatically denied this he has been suspended pending the decision of the Local Government Board. (Page 69.)

The new Royal Naval Hospital at Chatham, begun in 1899, has cost about £400,000. Accommodation is provided for 600 patients. (Page 66.)

In Praise of English Sanitation.

WE frequently hear disparaging remarks, more especially from painters, on the dingy streets and sordid houses of our large towns as compared with foreign cities; but though in this matter we may be deficient as regards outward show it is worth while remembering that we stand pre-eminent in what, after all, is the greater matter, namely, the interior of our buildings. We are first and foremost in sanitation, not only in respect of fittings but also in the greater sense of healthy planning, ventilation and water-supply. For many years past we have made vast strides in these directions, and there is now hardly a small town which has not its public sewers and by-laws that compel the provision of water-closets and prevent contamination of the air by the proximity of ashpits and dampness in subsoil. The efforts of our medical men and sanitary engineers do not, however, receive the appreciation they deserve, though the Royal Institute of Public Health, the Royal Sanitary Institute, and other associations, exist for the promotion of these measures of national safety. Our sanitary engineers and plumbers are continually improving fittings but receive little commendation. English manufacturers of sanitary ware and appliances hold the Continental markets, though they are experiencing a continual increase in competition from foreign firms, whose fittings are intricate but inferior in other respects to our own. Even the United States, with all its boasting, cannot compare for sanitary efficiency with this country, while on the Continent sanitation is practically non-existent. Only the largest towns there are provided with sewers, and these have open untrapped gulleys that smell abominably, while the canals and rivers are nauseating. Most of the houses have the ordinary pan-closets, and many of the hotels—even if the latter do have water-closets with English fittings—have little or no supply of water to flush them. English architects, therefore, if they cannot rival their foreign brethren in grandiloquent exteriors, beat them in giving comfort to the occupants of their buildings by greater consideration for sanitary fittings and healthy planning. The French alone are said to be able to plan monumentally. However that may be, foreign planning is hygienically bad. In this country there has been a continual reduction of the death-rate, and if there is a physical deterioration of the race it is not due to imperfect sanitation, but must be traced to the crowding of

people into towns, where there is an insufficiency of air and chances for exercise, and by reason of the inefficient and insane being allowed to multiply. Our population is no longer chiefly engaged in agriculture, and we should therefore take means to gain the exercise and fresh air that are so necessary for constant good health. But in the matter of sanitary efficiency we need not fear.

The End of Archaeology.

THE time has gone by when architects and others were so unfortunately blinded by the halo of antiquity as to think that everything old was estimable and beautiful, though, of course, there is always with us a remnant of fogs whose delight it is to go into raptures over ancient remains in every nook and cranny of the earth. The fact is, much old work is deadly dull stuff, badly designed and clumsily executed; and a course of study in ecclesiastical buildings of bygone days, however desirable for historical reasons, is boring to anyone in touch with the best work of to-day. We have heard too much of that egregious phrase "the loving hand of the workman." It has led us into all sorts of pitfalls and brought us through that appalling era of "repoussé" when anything in the nature of a smooth surface was to be regarded as the most undesirable of all results: an era of bumps and rough places—all exemplary of "the loving hand of the workman"—and products more suggestive of the Old Stone Men than of people living in our midst. It would be idle to attempt to disparage the delightful examples of design and handicraft which are to be seen in old buildings up and down the country, in comparison with which the bulk of modern work of a similar kind is sadly deficient. What we mean to infer is that archaeology, as it was understood in the last century, is now to all intents and purposes a dead letter among moderns: in proof of which we need only ask how much interest is evinced in lengthy descriptions of some mediocre church dating even from centuries ago? That this is the case we regard as a healthy sign, because the all-absorbing study of the past merely as archaeology kills any hope for fresh work in the present. Therefore we urge—and in our columns we endeavour to promote—the claims of the best work done to-day; the problems of to-day; and the excellent achievements of to-day. An architect is not a scenic but a constructional artist. His material is the present, his heritage the past: and his education the knowledge of the present more than the study of the past.

THE CHEAP COTTAGES EXHIBITION.

LAST week we gave some particulars of the initiation and aim of the Cheap Cottages Exhibition which is now being held at Letchworth (Garden City), in Hertfordshire. We are now able to give a number of specially taken photographs of some of the most interesting cottages, together with plans and particulars. Before proceeding, however, to deal in detail with the cottages, it will be as well to make some comment on the all-important question of cost. The idea of this exhibition is to show what can be done for £150, but we very much question whether many of the cottages have been erected for this sum, despite the naïveté with which this is set down as a fact in the exhibition catalogue; indeed, we feel certain that a great many of them have cost something very much nearer £200 than £150; and in considering this exhibition it is also necessary to remember that when "cost" is spoken of it seems to mean, not only the expenditure minus architect's fees and builder's profit, but also (in the majority of cases) minus the carriage on materials, fencing and the numerous other necessary requirements of a cottage, which, in actual everyday work, have an awkward way of totalling up the cost. Moreover, as the exhibition is specially intended to show the

public what can be done for the money, it is necessary, we think, to point out that these are not what can really be called £150 cottages, because that sum (even assuming it is not exceeded) is nothing but the bare cost of the work. Hence a comparison between the cost of cottages built by landowners on their estates and those now to be seen at Letchworth will be entirely false unless the fact is borne in mind that in the one case everything has been included, while in the other only the actual labour and materials are taken into account.

With that preface and its warning (which we make in no spirit of disparagement of this very useful exhibition, but rather that the actual truth be known) we may proceed to give some particulars of the cottages here illustrated.

Brick Cottages.

It is fitting perhaps to begin with cottages of brick. Of these there is a great number—some of them left plain, others rough-cast and others whitewashed. A very interesting and well-designed example is afforded by the pair of cottages by Mr. Geoffrey Lucas, A.R.I.B.A., illustrated on the opposite page. Each of these has a front room 14ft. 6ins. by 10ft. 6ins. by 7ft. 6ins., with a kitchen or living-room behind 14ft. 6ins. by 10ft. 7½ins. by 7ft. 6ins., fitted with range and bath; also a scullery 6ft. 6ins. by 5ft. 6ins., sink and

copper; coal-hole, larder, &c. On the first floor are three bedrooms 14ft. 6ins. by 8ft. 3ins. by 10ft., 12ft. 9ins. by 7ft. 3ins. by 10ft., 9ft. 9ins. by 7ft. by 10ft. The cost is put at £400, including carriage of materials to site, contingencies, drainage, and other items, which is at the rate of 5½d. per ft. cube. The walls are of 9in. bricks and the roof is tiled. There is a concrete bed under the floors, which are of timber. The instructions were to use white Arlesley bricks and sash windows, both of them difficult things to employ (the sash windows particularly so) in a small building, the height of which had to be kept as low as possible on account of cost, but it will be generally admitted that the architect has been very successful in his result.

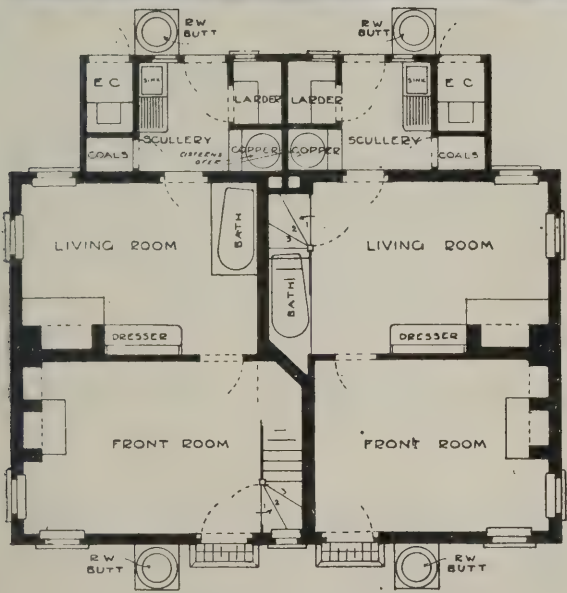

Another very interesting brick cottage is that by Mr. A. H. Clough, of Ringwood, the cost of which is put at £135. It consists of two floors on which are arranged a living-room or kitchen (with range), 13ft. 6ins. by 10ft. 6ins. by 7ft. 6ins.; larder; scullery with fireplace and copper, 9ft. 6ins. by 7ft.; coals, earth-closet; and at the other side of the cottage a parlour, with grate, 13ft. 6ins. by 9ft. by 7ft. 6ins. Above are three bedrooms, 13ft. by 9ft. by 8ft., 10ft. 6ins. by 9ft. by 8ft., and 13ft. by 8ft. 6ins. by 8ft. The walls are 1½ins. hollow, the floors

PAIR OF BRICK COTTAGES BY GEOFFRY LUCAS, A.R.I.B.A.
COST £400.

GROUND FLOOR PLAN

FIRST FLOOR PLAN

boarded, the roof of Bridgewater tiles, and the foundations of concrete.

Of other brick cottages here illustrated we may refer to those by Mr. A. Randall Wells (p. 62) and Mr. M. H. Baillie Scott. Mr. Wells's cottage is a detached cottage, white-washed, the cost of which is estimated at £150, plus the profits and other items deducted in accordance with the conditions. The cottage is on two floors and consists of a living-room 15ft. by 14ft. by 7ft. 6ins.; sitting-room, 14ft. by 10ft. by 7ft. 6ins.; scullery with bath, 14ft. by 7ft. by 7ft. 6ins.; larder and fuel store, each 7ft. by 5ft. by 7ft. 6ins., and two cupboards. Above are three bedrooms, 14ft. by 10ft. by 8ft. 6ins., 15ft. 4ins. by 11ft. 6ins. by 8ft. 6ins., and 14ft. 6ins. by 14ft. by 8ft. 6ins., all with hanging

recesses and fireplaces. The walls are gin. brick. The ground floor, except the parlour, is of red quarries, and the parlour and bedrooms 1in. boards on wooden joists. The roof is of hand-made pantiles and the foundations are of cement-concrete. Comfort, health, tidiness and cheapness are the special advantages claimed for this cottage.

The pair of cottages by Mr. Baillie Scott, of Bedford, is illustrated on p. 61. The cost price is put at £420, or £35 per room. Each cottage contains a kitchen or living-room, 12ft. by 20ft. by 7ft. 6ins.; parlour, 12ft. by 9ft.; scullery, with gas stove, &c., 9ft. by 12ft. by 8ft.; pantry, &c.; bedrooms, 12ft. by 13ft., 11ft. by 7ft. and 12ft. by 9ft.—all 8ft. high. The walls are of gin. brick, rough-cast, with oak half-timber. The

ground floor is paved with red bricks and the upper floors are boarded. The roof is of oak, red tiled, and the foundations are of concrete. The two cottages are so arranged that they can be turned into one.

Concrete Cottages.

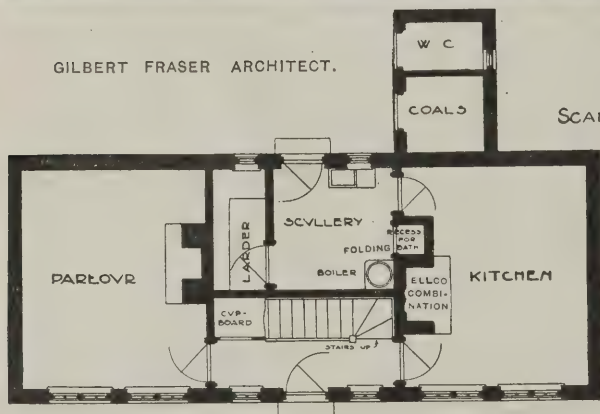

Many cottages in concrete are shown. That illustrated on the next page was designed by Mr. Gilbert Fraser for the Concrete Machinery Co., Ltd., of 18, Water Street, Liverpool. The walls are built with concrete blocks made on the site by means of the company's portable "Pioneer" hand-power machine, having a minimum capacity of 150 blocks (each 32ins. by 9ins. by 10ins.) per day. This cottage has on the ground and first floors the following accommodation:—Parlour, 14ft. 6ins. by 12ft.; kitchen, 14ft.

GILBERT FRASER ARCHITECT.

CONCRETE BLOCK COTTAGE. COST £150.

SCALE OF 10 5 0 10 20 FEET

GROUND FLOOR PLAN

FIRST FLOOR PLAN

6ins. by 12ft.; scullery, 8ft. by 8ft.; larder, 8ft. by 3ft. 6ins.; staircase and entrance hall, 11ft. 6ins. by 6ft.; landing and staircase, 11ft. 6ins. by 6ft.; bedrooms, 14ft. 6ins. by 12ft., 14ft. 6ins. by 12ft., 11ft. 6ins. by 8ft. The floors are of wood on a solid floor, and wood boards on wood joists. The roof is tiled and the foundations are of concrete. The cost is put at £150. It is stated that a cottage like this can be erected in six weeks and that $\frac{1}{8}$ th and $\frac{1}{4}$ th per cent. on the total cost would be saved respectively by erecting two and four at a time.

Messrs. Potter & Co., Ltd., have erected three concrete cottages, with which we shall deal in our concluding article next week. Another interesting cottage (illustrated on p. 64) is that to be built by Mr. John A. Brodie, M.I.C.E., M.I.M.E., city engineer of Liverpool, designed to cost £150, or 3 $\frac{3}{4}$ d. per ft. cube. Concrete slabs made from destructor clinker slightly reinforced with steel are to be used for the walls, the thickness being 6ins. throughout. The floors are to be of concrete with tongued and grooved boarding in the centre; the roof and foundations are

also to be of concrete. The principle adopted for the construction of each room in the building has been that of a dove-tailed box, in which each of the four sides, the floor and the ceiling of the rooms, is made of one concrete slab suitably reinforced with steel and made in a mould. The cottage contains a kitchen 12ft. by 13ft. by 8ft., with range; parlour, 8ft. 6ins. by 13ft. by 8ft., with fireplace; scullery, 7ft. by 8ft. by 8ft., with sink and boiler; larder; w.c.; bedrooms, 12ft. by 13ft. by 8ft., 8ft. 6ins. by 13ft. by 9ft., 7ft. by 11ft. 3ins. by 8ft.; pantry, &c.

Another type of concrete construction is to be seen in the one-floor cottage or bungalow designed by Messrs. Hesketh & Stokes (p. 64), and now being erected by Messrs. Cubitt. The plan is that of a polygonal figure of sixteen sides, this being on the principle that the nearer a building approaches a circle the larger is its contained area. The rooms, it will be seen, are grouped around a central hall of 50ft. super., the kitchen, with range, being 154ft. super., scullery 77ft. super., parlour 115ft. super., two bedrooms 77ft. super. each, and the third

bedroom 115ft. super.: average height of rooms 9ft. 6ins. The walls are formed of 2in. slabs of concrete separated by an air-space, the roof of concrete slabs covered with slates, and the floor and foundations of reinforced concrete not less than 6ins. thick in any part, with wood floors to living-rooms. The divisions between the rooms are formed with 2in. concrete slabs. The chimneys are collected together centrally. The cost of this cottage is put at £200, but it is stated that there would be a saving of 2 $\frac{1}{2}$ per cent. if two were built together and of 5 per cent on four.

"Mack" Slab Cottages.

Messrs. J. A. King & Co., of 181, Queen Victoria Street, E.C., have built a bungalow and a cottage from plans prepared by Mr. V. Dunkerley. We give a plan and elevation of the former on p. 63. This comprises (on the ground floor only) a living-room, with range, 16ft. by 12ft. 6ins. by 9ft.; scullery, with copper and stove, 7ft. 5 $\frac{1}{2}$ ins. by 7ft. by 9ft.; larder, w.c., coals, &c.; three bedrooms, 12ft. by 9ft. 4ins. by 10ft., 11ft. by 9ft. 4ins. by 10ft., and 11ft. by 8ft. by 9ft. The walls

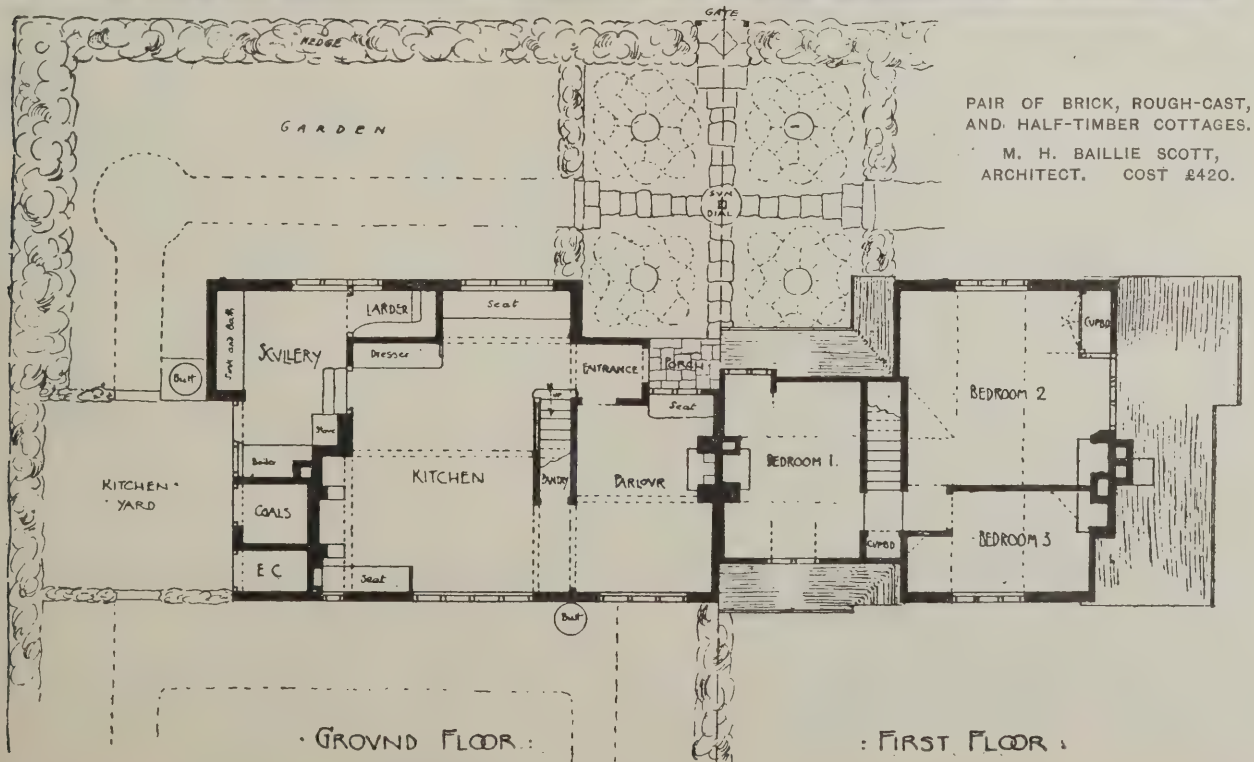

are of "Mack" partition slabs 4ins. thick, the exterior being covered with rough-cast. The floors are wood blocks laid in bitumen on a 6in. bed of Portland-cement concrete. The roof is of timber, covered with machine-made tiles, and the foundations are of concrete. All the rooms lead from a small hall lighted from the roof, the doors of the three bed rooms being so arranged that a curtain can divide these from the rest of the house. The whole of the materials used are "Mack" partition and ceiling slabs, the only brickwork erected being in the construction of the fireplaces. The cost is put at £130, or 3½d. per ft. cube—£118, excluding builder's profit. The cottage erected by this firm is on two floors, and contains a living-room, with range, 15ft. 10ins. by 14ft. 2ins. by 8ft. 9ins.; par-

lour, with register grate, 11ft. 9ins. by 11ft. by 8ft. 9ins.; scullery, with self-setting range, copper, and folding bath having hot and cold water, 11ft. 9ins. by 7ft. 6ins. by 8ft. 9ins.; bedrooms, 13ft. 4ins. by 12ft. 6ins. by 8ft. 6ins., 13ft. 5ins. by 9ft. by 8ft. 6ins., 10ft. 6ins. by 9ft. 7ins. by 8ft. 6ins.; larder, coals, w.c., scullery, dresser, store cupboards, &c With the exception that the hall, scullery and conveniences are laid with red quarries, the walls, roof, floors and foundations are similar to those of the bungalow. The outer walls to the height of the first-floor window-sills are of "Mackolith," this being a composition of Mack slabs faced with tiles to represent brickwork. The tiles are keyed to the slabs in the process of making, and it is impossible to loosen or detach them. The cost is esti-

mated at £150 (£25 per room), or, including builder's profit £165 (£27 10s. per room).

The Uralite Cottage.

Messrs. Wheeler & Son, of Horsham, have designed for the British Uralite Co., Ltd., of 50, Cannon Street, E.C., a cottage which contains (all on the ground floor) a kitchen 16ft. by 11ft. by 8ft. 2ins.; scullery, 8ft. by 8ft. by 7ft. 10ins.; bedrooms, 9ft. 6ins. by 7ft., 12ft. 6ins. by 10ft., and 10ft. by 7ft. 6ins.—all 7ft. 10ins. high; larder, coal-house and w.c. The walls are 4½ins. to underside of floor-boards, and faced with rin. cement rough-cast; 9in. footings. There is a damp-course of double-course slates in cement, 4in. by 4in. angle-posts, and 4in. by 3in. studding covered with Uralite Kent board both sides, painted and sanded externally and whitened inter-

BRICK COTTAGE BY A. RANDALL WELLS (£150) AND TIMBER COTTAGE BY F. W. TROUP (£150).

FIRST FLOOR PLAN

GROUND FLOOR PLAN

PLANS OF COTTAGE BY A. RANDALL WELLS.

nally. Floors, joists, 6ins. by 2ins., 12ins. apart; 4in. by 3in. plates on sleeper walls; 1in. white flooring. The roof is rough-boarded and covered with 12in. by 8in. red Uralite Kent-board tiles. The foundations are of 6in. concrete. The cost is put at £150, or 4d. per ft. cube. The advantages of this cottage are stated as follows:— Cheap; permanent; fire- and vermin-proof; cool in summer, warm in winter; ease and rapidity of erection.

New Expanded Metal Co., Ltd.

This firm has erected one detached and two semi-detached cottages (see p. 64). The dimensions of the single cottage, which consists of ground and upper floors, are as follows:— Living-room, with range or kitchener, 14ft. 6ins. by 9ft. 6ins. by 7ft. 6ins.; parlour, with mantel grate, 11ft. by 10ft. 3ins. by 7ft. 6ins.; scullery in kitchen, with movable copper; bedrooms, 14ft. 6ins. by 9ft. 6ins. by 8ft., 10ft. 3ins. by 8ft. by 8ft., 9ft. 3ins. by 6ft. 6ins. by 8ft.; sheds for coals, wood, &c., pantry and two cupboards. The dimensions of the semi-detached cottages are:— Living-room, 15ft. 6in. by 14ft. by 8ft., with range; scullery, 9ft. by 8ft. by 8ft., with movable copper; pantry and three cupboards, and sheds for coal, &c.; bedrooms, 12ft. by 11ft. 3ins. by 8ft., 12ft. 6ins. by 7ft. 6ins. by

8ft., 9ft. by 6ft. 6ins. by 8ft. The external walls are of timber framing with expanded metal lathing and Portland cement plaster in two skins, giving 4ins. hollow space. The internal walls are of expanded metal lathing and plaster, 2ins. thick. Floors, timber joists and flooring boards, with expanded metal lathing and plaster ceilings. The roofs are of asbestos slate on timber framing, and the foundations of concrete. The cost is put at approximately £150 each cottage, or 5½d. per ft. cube; three could be erected in about six weeks. The special features are the ease with which the materials can be obtained, transported and erected; lightness and durability of the structure; and the even temperature and dryness on account of the hollow external walls.

Wood Cottages.

Some of the cottages are of wood. One by Mr. F. W. Troup, of 14, Gray's Inn Square, W.C., is illustrated above. This has a living-room with range, 16ft. 3ins. by 11ft. 9ins.; scullery with copper, 11ft. by 10ft.; larder, coal-place, &c. and two cupboards, besides a bath which can be shut off the scullery. There is a bedroom on the ground floor 9ft. by 10ft. and two bedrooms above (attics) 12ft. by 11ft. 3ins. and 12ft. by 9ft. The walls are framed of 4in. by 2in. timbers,

UPPER FLOOR

GROUND FLOOR

PLANS OF COTTAGE BY F. W. TROUP.

braced and covered with insulating paper and weather-boarding outside; lathed and plastered inside. The chimneys and foundations up to the floor-level are of brick. The roof is of pantiles and the foundations are of 6in. cement concrete over the whole area, and extending 6ins. beyond the walls all round. The special features claimed for this cottage are the avoidance of patents, and the fact that any repairs would be easy and inexpensive. The cost is put at £150, or 4½d. per ft. cube, and it is stated that the cottage could be duplicated for the same sum plus the profits, &c.

This concludes our description of the cottages illustrated in this issue. Next week we shall give a further series of photographs and plans, together with other descriptive particulars.

A Sanatorium has been opened at Eden Hall, Woodford Green, Essex. The building cost £47,000, and has accommodation for twenty patients.

COTTAGE BY BRITISH URALITE CO., LTD. WHEELER AND SON, ARCHITECTS.
COST £150.

SOUTH ELEVATION

BUNGALOW BY J. A. KING & CO. ("MACK" SLABS, ROUGH-CAST.)
V. DUNKERLEY, ARCHITECT. COST £130.

DOOR HOOD FORMED WITH EXPANDED METAL.

SINGLE COTTAGE AND PAIR OF COTTAGES BY NEW EXPANDED METAL CO., LTD. OLDRID SCOTT & SON ARCHITECTS. COST £150 EACH COTTAGE.

SOUTH ELEVATION

SECTION A-B

FIRST FLOOR PLAN

GROUND FLOOR PLAN

CONCRETE SLAB COTTAGE BY JOHN A. BRODIE, M.I.C.E., M.I.M.E., CITY ENGINEER, LIVERPOOL. COST £150.

REINFORCED CONCRETE COTTAGE BY CUBITT, HESKETH AND STOKES, ARCHITECTS. COST £200.

NEW BATHS AT HULL

THE new baths at Hull illustrated on this page have been built for the northern and north-western portions of the city on a site at the corner of Beverley Road and Epworth Street. The accommodation is as follows:— Men's swimming-bath, 100ft. by 35ft.; depth of water, 3ft. 9ins. to 6ft. Boys' swimming-bath, 60ft. by 40ft.; depth, 2ft. 6ins. to 4ft. Ladies' swimming-bath, 65ft. by 34ft.; depth, 3ft. 3ins. to 5ft. Also forty-eight slipper-baths. The elevation of the building is in red Leicestershire sandstocks with dressings of Ancaster stone. The covering of the cupolas and Mansard roof is of copper. In the large swimming-bath the gallery is of steel and concrete, and is fitted with tip-up seats. A new feature for Hull has been the provision of spray-baths for washing. The slipper-baths are of enamelled porcelain, and are provided with hot and cold showers. The waiting hall for these baths is 38ft. by 17ft., and has a refreshment buffet at one end. The floors throughout the public part of the building, except in the long corridor to the boys' bath, are of marble mosaic. The lower part of the walls where not exposed to rough treatment is tiled and

elsewhere faced with enamelled bricks, the upper part being faced with buff bricks, relieved in places with coloured bricks. The building is lighted throughout by electric light, Nernst lamps being used in the larger rooms. The ventilation of the large swimming-bath is assisted by sun-burners placed under the ventilators (Boyle's). For heating the swimming-baths two methods are available. In beginning to fill the baths hot water is passed in from one or two of the boilers until the water has reached a certain level, when the hot water is cut off and steam turned on from another boiler. This steam passes through an injector, which draws the water from the deep end of the bath and returns it at the shallow end, and after the bath is filled the temperature is maintained and the water kept in circulation by this method. An efficient steam laundry is provided, and the towels, &c., are in a room over the boilers, utilizing heat which would otherwise be wasted. The building and engineering work was designed by the city engineer (Mr. A. E. White, M.I.C.E.), the assistant in charge of the work being Mr. T. Thomas. The contractors for foundations and bath tanks were Messrs.

NEW BATHS AT HULL. A. E. WHITE, M.I.C.E. (CITY ENGINEER), ARCHITECT.

E. Good & Sons, of Hull, and for the superstructure Messrs. Quibel, Son & Greenwood, of Hull. The mosaic paving is by Messrs. Hodkin & Jones, of Sheffield; the tile and faience work by Mr. Alfred Whitehead, of Leeds; hardwood joinery by Messrs. H. Arnold & Son, of Doncaster; and laundry machinery by Messrs. W. Summerscales & Sons, of Keighley. The cost of the buildings and fittings may be taken as £25,000, which is £2,000 below the amount of the estimate, and works out at 7½d. per cub. ft.

Keystones.

The Junior Institution of Engineers.—Mr. Dugald Clerk, M.I.C.E., the well-known gas-engine expert, has been elected president for the ensuing session.

A new Baptist Church at St. Margaret's, Richmond (Surrey), is to be built at a cost of £2,500. Mr. F. J. Brewer is the architect and Messrs. S. N. Soole & Son, of Richmond, are the contractors.

A new Fire-brigade Station at Swansea has been erected on a site between Alexandra Road and High Street at a cost of £8,500. Mr. John Williams was the contractor and Mr. Bell (borough surveyor) the architect.

30,000,000 Bricks.—In defence of the proposal of the Lancashire County Council to erect a new lunatic asylum on clay subsoil, it was stated at a Local Government Board enquiry recently that the clay would be used for making the 30,000,000 bricks required, and thus bring about a saving of £12,500.

St. Martin's Church, Caerphilly.—An extension has been made to this church, providing seating accommodation for 370 persons at a cost of about £3,000: the whole scheme amounts to upwards of £7,000. Messrs. Halliday & Rogers, of Cardiff, are the architects, and Messrs. Blacker Brothers, the builders.

Ancrum Road School, Dundee, is to be enlarged from designs by Mr. J. H. Langlands, architect, at a cost of £8,000. For the first time in Dundee the use of electric light will be adopted in a school. Mr. Langlands is also endeavouring to secure the adoption of a system of local telephones between the classrooms and the headmaster's office.

An old Mahogany Stair Balustrade to be removed from old Dunnikier House, Kirkcaldy, is offered for sale. The balustrade winds around an open well-hole 3ft. in diameter to a height of four storeys. There are in all 110 finely wrought and turned spiral balusters. Mr. D. Forbes Smith, architect, has a very high opinion of this piece of old craftsmanship.

The Royal Engineers' South African Memorial at Chatham, unveiled by His Majesty the King last week, takes the form of an arch and was designed by Mr. E. Ingress Bell, F.R.I.B.A. A principal feature is a series of sculptured panels in high relief (by Mr. W. S. Frith) showing blockhouses, a pontoon bridge, a military balloon and a destroyed railway bridge. Two other panels, representing Paardeburg and Wagon Hill, are required to complete the series. The composite capitals to the columns, the stones of the arch (figures of Victory) and the spandrels containing representations of the medals for the campaign are the work of Messrs. Fagan & Bell; the marble tablets and inscriptions by Messrs. Farmer & Brindley; and the copper lamps on the detached piers by Messrs. Thomas Elsley, Ltd. The general contractors were Messrs. Longley & Co., of Crawley.

The memorial statue to Queen Victoria at Nottingham, by Mr. Albert Toft, was unveiled on Friday last.

An equestrian statue of the late Duke of Cambridge is proposed to be placed on a site opposite the Horse Guards and the new War Office.

The new Parish Council Chambers at Hamilton, which have been designed by Mr. Alexander Cullen, architect, will be built of Earnock stone.

Blackpool's new Sea Defence Works and Marine Promenades, which have occupied nearly three years in construction, at a cost of little short of £450,000, were completed last week.

A Semicircular Seat of Dartmoor Granite has been erected as a memorial near Colyton. It was executed by Messrs. Harry Hems & Sons, of Exeter, from designs by Mr. T. Phillips Figgis, F.R.I.B.A.

Competition for the Palace of Peace.—In the competition to be held for the erection of a Palace of Peace at the Hague a first premium of £600 and six other premiums of lesser value are to be offered. The award will be made by a jury consisting of an Englishman, a German, a Frenchman, a Dutchman, an Austrian and an American.

Laying the Last Brick.—Councillor Craig, architect, of Leith, recently ascended to the top of the chimney of the new electric tram-car depôts at Leith Walk (a height of 208ft.) and laid the last brick. The foundation was laid in soft running sand, and consists of concrete 40ft. in diameter and 12ft. thick, weighing 520 tons. The chimney weighs 1,800 tons.

South African Memorial Buildings, Eton College.—Princess Alexander of Teck laid the foundation-stone of these buildings on Saturday. There will be a school hall 140ft. long, 55ft. wide and 45ft. high, an octagonal library of about 55ft. diameter, and a classical museum. The architects are Mr. L. K. Hall and Mr. Sydney K. Greenslade. The buildings are estimated to cost not less than £40,000.

The Memorial to the late Dr. Temple in Canterbury Cathedral was unveiled by the Archbishop of Canterbury on Saturday. It takes the form of a pedestal upon which rests a kneeling figure, in an architectural setting, the whole monument being surrounded by an oaken canopy. Mr. W. D. Caröe was responsible for the design and Mr. F. W. Pomeroy for the figure, while the setting was executed by Mr. Hitch.

The new Royal Naval Hospital on Chatham Hill was visited by His Majesty the King last week. Accommodation is provided for 600 patients. There are fourteen general wards, each 120ft. by 28ft. and containing 28 beds. Begun in 1899, the hospital has cost about £400,000. The contractors were Messrs. Perry & Co., of Bow. Sir Henry Pilkington, R.E., was the engineer-in-chief and Mr. J. C. T. Murray, F.R.I.B.A., the architect. The work was carried out under the superintendence of Mr. S. P. Brinson, C.E.

The Origin of the Royal Academy.—It is probably a mistake (says Mr. Clouston in the "Burlington Magazine") to suppose that Angelica Kauffman was included as an original member of the Royal Academy through Reynolds's influence; it is, in fact, much more likely that she had a good deal to do with the actual grant of the Charter. Whatever the Academy may or may not have done to justify its existence, nothing can be more certain than that it was founded on pique and came into being through backstairs intrigue. Angelica had Queen Charlotte's ear, and her influence with Royalty could only have been second to that of Sir William Chambers, the Royal drawing-master.

OUR PLATES.

THE new head-office of Parr's Bank in Manchester is situated at the corner of York Street and Spring Gardens. The exterior is built in red Carlisle stone, the design being Classic Renaissance. The whole area is given up to the bank's premises on the ground floor and basement, the three floors above being let as offices. The two large strong-rooms in the basement are most completely armoured with triple-steel on walls, floor and ceiling. On the banking floor great attention has been paid to the decoration. All the walls are lined with marble, as will be seen by the photograph. The saloon roof over the clerks' chamber, which is glazed completely across its whole span, is finished with enriched fibrous plasterwork. All the woodwork is polished mahogany, and the large window frames are of bronze. The fittings are of white metal. On the upper floors a special feature is made of the corridors to the office suites, which are treated with fibrous plaster arched work. The builders were Messrs. Neill & Sons, of Manchester, and the architects Messrs. Charles Heathcote & Sons, of Manchester and London.

THE GOODYEAR EXHIBITION.

OWING to the lack of time and the difficulty in getting the exhibits to this country by a given date, the opening of the Goodyear Exhibition of Architectural Refinements at Edinburgh will not, as previously announced, take place in August, but has been postponed until September 5th. The exhibition will be held in the National Portrait Gallery, Queen Street, Edinburgh, and it is hoped that those who are interested in Mr. W. H. Goodyear's researches, and may wish to be present at the opening, will kindly send in their names to the hon. exhibition secretary, Mr. L. Ingleby Wood, Edinburgh Architectural Association, 117, George Street. A feature of the exhibition will be the very fully illustrated catalogue which has been specially prepared for the occasion by Mr. Goodyear, and which is illustrated by a series of blocks lent by the directors of the Institute of Arts and Sciences, the "Architectural Record" and the "American Journal of Archaeology."

Builders' Notes.

A new Industry at Leeds is being developed by the Northern Asphalt and Roofing Works Co. (Mr. G. H. Plows, general manager). The firm has contracts on hand for the supply of 5,000 sq. yds. of asphalt pavement for the new Princess Parade extension at Bridlington, 5,500 sq. yds. of asphalt roofing for the Bristol Docks Harbour Board, and 1,500 sq. yds. of asphalt pavement for the Selby isolation hospital. The laying of bitumen sheeting at the Ferry Bridge waterworks and the manufacture of bitumite for cable laying for electrical purposes—which is about 33½ per cent. cheaper than the ordinary bitumen shipped from Trinidad—have also been in the hands of the company.

Obituary.

Mr. George Brown, builder and quarry-master of Hamilton, died recently, aged 41.

Mr. Alexander Hendry, of the firm of Messrs. Hendry & Keith, house carpenters and builders, of Aberdeen, died recently, aged 75.

The late Mr. John Nash Peake, brick and tile manufacturer, of the Tunstall and Rosemary Hill Tile Works, left estate of the gross value of £27,438.

SCHOOL PLANNING.

AT the recent London congress of the Royal Institute of Public Health several papers were read on the planning of schools. We give reports herewith.

Mr. Robson's Paper.

A paper on "The Planning of Educational Buildings" by Mr. E. R. Robson, F.S.A., was read by Mr. Philip A. Robson, A.R.I.B.A. The author said that, having travelled much in Europe and America to glean from the best educational buildings; having built hundreds of schools; having been consulting architect to the Government for nearly twenty years; and, in short, having spent the best years of his life in the work, he proposed to touch on such hygienic points as he could establish from his own observation and experience, regarding it as a duty to do this little to advance a subject on which he had ever felt himself to be a pioneer.

As a preliminary he directed attention to the late Sir Douglas Galton's little book on "Healthy Houses," because its simplicity and scientific truth stamped it as one of the most valuable and useful contributions to their main subject.

Sites.

The hygiene of a school really commenced with the site; therefore its surroundings should not provide foul smells or nuisances, should be free from stagnant water or undrained land, should not discharge surface-water on to the site, and should be innocent of any obstruction to sunshine or to the free passage of air all round.

Being large and airy, the site should, by preference, be fairly elevated, sheltered from north-east winds, open to the south and sloping away from the school. The subsoil should never, unless unavoidable, be of clay, but of a dry porous character giving a natural outlet for drainage, and in towns provided with at least one frontage to a wide street commensurate with the area of the site. The best shape was square. The water-supply must be sure. An example of a poor site owing to the subsoil was the new Bluecoat School at Horsham, and, *vice versa*, that of Lancing College might be cited.

The position of the buildings on the site was to be considered together with

Playgrounds.

which should face as nearly south as possible, be thoroughly underdrained with agricultural pipes, levelled, enclosed, and the surface laid with tar pavement or asphalt laid to fall sufficient for the effectual removal of all surface-water. Space should not be lessened nor usefulness impaired by needless buttresses, hiding corners, nor by internal quadrangles which were not open at the corners. For elementary and infant schools without central halls playgrounds were uncovered schoolrooms.

Some years ago, in a lecture at Brighton, the late Dr. Benjamin Richardson had advocated the raising of all houses a few feet above the ground, with a through current of air below, after the manner common in Switzerland. Though this theory created some amusement at the time, it was quite true that low-lying school sites, with the playground at a high level, did require this treatment; if land were costly, the space might be utilized by increasing the height to serve the purpose of a covered playground.

Wherever playsheds were provided, apex or ridge ventilation was necessary. The playground fencing should be unclimbable and all gates lockable. It was well to remember also that where large quantities of material had to be brought to the school buildings a double gate soon paid for itself by saving hand-cartage from the road.

If a water-fountain were placed in the playground it should be arranged with a

keyed waste-tap at the base and a stopcock inside the building to prevent bursts in frosty weather.

Entrances.

The number of entrances would vary according to the size of the school, but however many there were it was desirable to place them so that as little north and east winds as possible rushed into the school buildings. In elementary schools two entrances and staircases would suffice for 250. Above that number more would be necessary. The width of an entrance should never be less than 6ft., but a greater width might be desirable in some cases. The main doors should open outwards, and inner swing-doors were most desirable. Moreover, as much dirt as possible should be kept outside these swing-doors by means of scrapers, iron mats and fibre mats, for obvious hygienic reasons. The flooring of the corridors should be of tiles or granolithic paving.

Cloakrooms and Lavatories.

These seemingly unimportant rooms, if not properly planned, led to endless confusion, and might spread disease to a large extent. Glazed brick was best for the wall surface, and an impervious but dry flooring, such as good granolithic or one of the cork and plaster-of-Paris and cement compositions now on the market. Asphalt should not be used, as the condensation on its surface of the moisture in the air was highly disagreeable and unhealthy. The rails and pegs were best made of iron or steel, and each peg should be numbered. Why the space ordained by the Board of Education per child in secondary schools was now 1ft. and in the elementary schools 6ins. lineal in cloakrooms was difficult to understand: 1ft. per child would give greater aëration to the clothes, but would entail very large cloakrooms, and consequently great expense without an adequate return. All cloakrooms should be near the entrances, and needed to be planned to obviate confusion and to prevent any smell from the clothes entering the school proper. Hanging stands should be wired at the back to prevent clothes back to back from touching each other, and, incidentally, to prevent pilfering.

In boys' and infants' schools 4ft. gangways (4ft. 6ins. centre to centre) sufficed admirably with adequate organization. In girls' schools 5ft. centre to centre should be allowed. In secondary schools a much larger amount was necessary, dependent on their use. If used as changing-rooms, then 18in. lockers and 6ft. gangways were the minimum.

The height of a cloakroom in an elementary school need not exceed 9ft. if the room were thoroughly ventilated and heated. This height would enable mezzanines to be used with economical and practical effect.

Lavatory basins should not be placed in the cloakrooms, but in separate rooms inside the building and as near the cloakrooms as possible. Also the cloakrooms should not be made passages either to the lavatories or to the school, as at Hymers College, Hull.

Staircases.

The staircases should be fire-resisting, in short flights, no flight exceeding twelve steps, and of an easy gradient. The so-called French rule was perhaps the best to ensure a comfortable "going," namely, twice the rise added to the tread should be equal to 24ins. The surface of the tread should not wear badly nor work slippery. Handrails should be provided to both sides on the salt-glazed brickwork. Staircases which would take more than two persons abreast was dangerous, unless a centre handrail were provided, and when this was done another staircase should have been built instead. Emergency staircases in schools were ridiculous. Sufficient permanent staircases were necessities. The position of each staircase varied in each school, and it was

impossible to lay down any final rule on the subject. It was wasteful of the best light to face them south.

Central Halls.

In the best schools of the last few years a central hall was usually to be found; but in some of the newer schools a marching corridor was occasionally substituted, if there were some other rooms which might be thrown together for purposes of assembly.

A central hall should have an area of from 1,200ft. upwards, but too large a one was both extravagant and useless. Classes should not be held in this hall; though under exceptional circumstances, and where the hall had direct light, which could be obtained from the left side of the scholars, one class was admissible, and in secondary schools the hall might be used for art classes.

Classrooms.

All classrooms should be entered from the central hall through glazed doors opening into the classrooms. The amount of space per child to be provided had long been a bone of contention.

The official rules of the Committee of Council of Education originated in the perception that an architect without knowledge of school-working could know nothing of its planning, and in a desire to connect the inspector of elementary schools with their builders. It was then considered a great mark of progress to go beyond the old 6 sq. ft. per child, as held in Berlin, and to lay down a minimum of 8ft. of area for teaching-rooms.

Mr. Robson said it took him some years of struggle to get that 8ft. changed to 10ft. and to see it adopted by the Education Department as to new schools.

Recently a batch of rules as to secondary schools had appeared. These, with varied wording, were borrowed largely from his own rules, and it was necessary to say that he disapproved strongly of the minimum provision of 18ft. per child therein laid down. It was a needless extravagance, justifiable neither on grounds of education nor of health, and when it was stated that the residence of the teacher must be a "gentleman's house," only laughter was possible.

Cubic Space per Child.

From the experience of other countries 14ft. per child was as much as was necessary in either secondary or elementary schools, but the question of a cubic unit was a more far-reaching matter. It was established that, for reasons of health, no scientific reason existed for making classrooms of a greater height than 10ft. In American schools an average of 164 cub. ft. was usual, so that, with 14 sq. ft. per child and a room 12ft. high, the cubic content per child was 168 cub. ft., or 4ft. more than in America.

The numbers to be contained in each classroom might vary from eighteen to thirty-six in secondary schools and from eighteen to fifty in elementary schools; and elasticity of working was attained best by classes of forty and fifty in the latter and eighteen to thirty in the former.

In elementary schools dual desks 3ft. 4ins. long, with 1ft. 4in. gangways, were the most satisfactory when efficiently designed; but a more economical form, both in itself and in planning for it, was a continuous desk containing three separate seats. The objection to this was that the centre child had to disturb, even if slightly, one of the others in order to get out during school-time.

In secondary schools separate seats were necessary 2ft. wide with 18in. gangways.

In every classroom it was best to have a gangway at the back of the room, and, if a single desk were placed next to the side walls, to leave a space of 6ins. between it and the desk.

The Lighting of Classrooms

was the next important matter, after having settled the correct cubic space per child.

The unscientific lighting and the improper shapes of desks used in schools were largely to blame for the increase of weak sight. The following rules would be found satisfactory if taken together:—

1. A room facing south (or thereabouts) should have not less than one-sixth of its floor area as clear window glass, and those facing north (or thereabouts) one-fourth actual glass area, not window space.

2. No room was properly lit without subsidiary light if the distance from the window-wall to the wall opposite was more than 25ft.

3. All light should come to the left side of the scholars.

4. No windows should face the scholars or the teacher except for ventilation, or for subsidiary light behind the scholars in the corner of the wall away from the main light.

5. The rooms should not be less than 10ft. high; 12ft. was ample.

6. The height between the top of the glass and the ceiling should be never more than 2ft., preferably less.

7. The height from the floor to the bottom of the glass, 4ft.

8. The ceiling should be white, the walls very pale green (non-poisonous and washable), the ordinary woodwork white (enamel).

9. Heavy piers should be avoided if possible between the windows; also thick mullions and transoms and very small panes.

Artificial Lighting.

The best form of artificial lighting was by acetylene gas generated by an apparatus in which the calcium carbide dropped into water, and then the gas should pass through a purifier. Having used this form for some years, after considerable experiment and after having used every other kind of illuminant, he had no hesitation in making this statement. Acetylene was no more dangerous than coal-gas. The next best method of lighting was by purified coal-gas and incandescent mantles. The objection to this form was its heat and consequent deterioration of the air. The worst form was electric light, unless the red ray were killed, but it was the most convenient, and if used with common-sense was comparatively inexpensive.

Thermometers.

Whatever methods of heating and ventilation were adopted in a school, it was important that the officers of the school, as well as the caretaker and engineer, be instructed how to use the apparatus intelligently. One of the rules of the Board of Education stated that a thermometer should be in every room (p. 8, rule 32, form 1904). This seemingly unimportant regulation or suggestion was conspicuously disobeyed. The rule should further state that the following registers of the temperature should be made daily:—

1. By the caretaker before lighting the furnaces or fires.

2. By the headmaster at the first moment of assembly in the classroom.

3. By the headmaster at the luncheon interval.

A form supplied for this purpose should soon give valuable results. Every schoolmaster would know if the system adopted were satisfactory or not and also the moment it got out of order.

The Design of Windows.

The greatest factors in ventilation under ordinary circumstances were properly designed windows. In following the rules hereinbefore expressly laid down these further additional hints would be useful:—A sash-window was the best form to use, with a fanlight at the top. This gave ventilation at four points in a height of from 6ft. to 8ft., according to the height of the room. A vertical sill-board was useful to prevent draughts at the bottom; and if the fanlight's fall were glazed, side-pieces or cheeks

were desirable to obviate down-draught. The amount of window-space to be opened must vary in the different rooms, owing to the vacillation of our climate. But each child should receive 2,000 cub. ft. of new air per hour. In addition to this, further inlet ventilation was necessary by means of long Tobin tubes, the air entering at the floor level and discharging into the room up screwed shafts 6ft. long through "shutable" lids. The outlet should be by means of ordinary fireplaces, by separate flues properly proportioned to the size of the room and of the inlets and aided by electric fans, or by ceiling trunks aided in the same way or by a coil of pipes; ventilating radiators were liable to send draughts along the floor, and, moreover, if hot water were used in the radiators there was danger in frosty weather.

PLANNING OF ELEMENTARY SCHOOLS.

Mr. A. A. Kemp, J.P., read a paper on the planning and extension of elementary schools in rural and urban districts. In regard to the site, he said care should be taken that the altitude of the land was well above the storm-level of any stream in the neighbourhood, and, if possible, where a district was not sewered it should be in a position so that an effluent pipe could be carried from any scheme that might be adopted for treating the drainage to an open watercourse.

The best arrangement of the buildings, particularly for infant schools, was to group the classrooms around a central hall, with cloak-rooms on each end with flat roofs; the central hall being lighted above the cloak-room roof with large gable lights. This was much better than a lantern light in the roof, both as regards light and ventilation.

Heating and Ventilation.

This question had been so often discussed that little was left to add. In large schools heating by hot water on the low-pressure system was the best that could be adopted for even temperature, cleanliness and economy. The first cost was not much more than that of ventilating stoves, and the excess was soon saved by the reduction in the expenditure on fuel.

Speaking of ventilation, he said he had found many large schools ventilated by the windows only. This he considered an inefficient system. It caused draughts and was an inducement to the teacher having charge of the classroom to close the window, thus shutting out the supply of fresh air and preventing the exit of the vitiated air. To obviate this difficulty it was the practice in many cases to fix at the bottom of the sash-frames

A Deep Glazed Panel.

giving, when the sash was opened the depth of the panel at the bottom, a space between the meeting rails which acted as an air inlet. This failed to be as effective as it might be, for the air inlet was in this instance about 8ft. from the floor level, and the most suitable air inlets were those which were fixed from 5ft. 6ins. above the floor line and made in the form of a hopper. Vitiated-air plates should be fixed in the ceiling and connected with a tube to some efficient ridge ventilator in the roof. There were many manufacturers of these, so that no difficulty should be experienced in obtaining them.

Another Simple Form of an Extract Ventilator

could be formed by building in glass louvres in each gable; the ceiling plate in this case was covered with a rough interlocking hood, which prevented any chance of down-draught. Many people were in the habit of using a special ventilator, and were of opinion that no other was efficient; but his own view was that a building could be thoroughly ventilated without going in for any costly special appliances.

Construction of Walls.

The code set out by the Board of Education as to the construction of walls provided that they should be solid and not less than 14ins. thick; where hollow walls were used, one portion was to have the full thickness required for solid walls. This he considered wasteful, particularly when the building was only one storey high. In many instances the wall did not exceed 14ft. in height, and would be quite safe if erected with two casings, 9ins. inside and 4½ins. outside, tied together with galvanized iron ties. This particularly referred to buildings in exposed positions, as in every case where 14in. solid walls were used there were portions of the wall which were always damp, thus causing an unhealthy building. The cost of the work would prohibit the walls being built with 14in. inner casing and 4½in. outer casing, as the code set out.

Inside Facing of Walls.

The inside of the walls should be faced dado high with glazed bricks, or some other suitable material which could be easily washed down and kept clean and sanitary. The walls above dado level should be faced with Portland cement faced with Keene's, and afterwards painted with indestructible paint, which likewise could be washed down and kept sanitary. All internal and external angles to walls, floors and ceilings should be formed with hollows and rounds at corners, thus preventing dust accumulating in the interior angles, also giving better facilities for sweeping the dust away from the intersections of floor and walls. Care should be taken that projecting ornamental mouldings, cornices and architraves were not introduced more than necessary in the interior of school buildings, as they only harboured dust and bacteria, which should be avoided as much as possible.

STOVES AND FIREGRATES.

By Henry Adams, M.I.C.E., M.I.M.E., F.S.I., F.R.S.I.

In a paper on smoke abatement which he read before the Congress Prof. Henry Adams, M.I.C.E., M.I.M.E., F.S.I., F.R.S.I., made extended reference to the various types of stoves and firegrates. Speaking first of warm-air stoves, he said

The Galton Stove,

designed in 1859 by Captain Galton, R.E., afterwards Sir Douglas Galton, chairman of the Sanitary Institute before it gained the prefix "Royal," had a cast-iron body and smoke-bend, both fitted with gills, thick fire-clay around the coals and a device for burning the smoke and gases. This required a special air-flue in the chimney-breast, and a special lintel, usually a stone, to the fire-place recess. It was designed for Army barracks on plain lines, and was not good-looking enough for rooms where appearance counted. In barracks one or more outlet flues were built in the ceiling at the end of the room farthest from the fire.

Boyd's Hygiastic Grate.

In this grate, designed by Pritchett, an architect, and brought out about 1871, the body was of three fireclay slabs—one to the back and one to each side—bevelled at the corner joints, and bedded in plaster against a stout sheet-iron case screwed to the cast-iron front frame. The warm-air grating, fitted with a shutter, was at the top of the frame, and the heated air passed to it by an open-ended box that divided it from the smoke, the shutter being the box lid. It was not very easy to fix, iron bars being needed to hold up the bricks, which also rested on the top edges of the body-slabs and butted against the back of the air-box; but the need of a trained man to fix it was its only drawback, for it could not be damaged by

reckless firing, and it gave no taint to the air, as too hot cast-iron did.

Boyd's newer Patent "Fresh-air Ventilating Grate"

stood independently in a fireplace, the whole of its surface being utilized for introducing fresh external air moderately and safely warmed, while at the same time it drew off the vitiated air of the room in proportion to the amount of pure air admitted. The heating surfaces of the sides of the body were trebled by means of gills on them, the back being left smooth to facilitate cleaning the warming chamber. The fuel chamber had thick cast-iron linings for its protection as well as to prevent the air being overheated, and these could be easily renewed without disturbing the grate itself. The bottom grating inclined upwards at the back to economize the fuel, the combustion being under control by a regulating ash-pit. The fresh air was introduced into the warming chamber by means of a conduit from out-of-doors and through openings in the hearth fitted with valves for regulating the supply.

The "Manchester" Grate,

made by Messrs. E. H. Shorland & Brother, was obtainable in two classes: the older one, with air-flues, often of glazed pipe, on each side of the smoke-flue in the chimney-breast, to conduct the heated air from the chamber around the grate body to the gratings, 8ft. to 10ft. above the floor; and the newer one, which discharged the air from the chamber direct into the room through openings in the canopy or front below the mantelpiece. The grate could be fixed by any bricklayer who was a fair workman. The air-passages were smaller and the volume of air delivered was less than those of its rivals, but all the air was thoroughly heated. This grate was made in patterns suitable to any building, and could be relied on to warm and ventilate a room when no old-fashioned extracting cowls and inlet panels were used as well.

Grundy's Patent "Warm-air Ventilating Firegrate"

was semicircular in plan, with gills behind and smoke-nozzle on top, all cast in one piece. It could be used with any design of register stove front. The cold air was admitted from behind the grate at the bottom, and the warm air was conveyed into the room by means of gratings fixed in the chimney-breast.

The "Teale" Grate,

invented about 1880 by Mr. Pridgin Teale, an oculist, was made of thick fireclay slabs, one of which sloped forward over the coals, with thin front bars to hold in the coal and let out the radiance, and a shutter or "economizer" to close up the air and ash-space below the bottom grating. A modernized form was Florence's patent, where a flue passed from the centre of the fire through the fireclay slab and up between the inclined slab and the iron back, a hinged front permitting the use of either the front or the back of the sloping slab for the passage of the products of combustion.

Overheating.

In warming the air of a room care must be taken not to burn it, or, to be more accurate, not to burn the organic particles suspended in the air, which would produce an objectionable odour; and there was another reason against overheating, namely, the air would not contain a fair proportion of moisture compared with its temperature. Where there was a doubt, a sufficient water surface should be exposed connected with the warming apparatus.

Close Fires or Stoves

were used more for churches, public halls, schools and railway waiting-rooms than for private use. They generally stood out from the wall, so that the heat was radiated all round, and the sides had projecting ribs or gills to increase the radiating surface (and

therefore the quantity of heat) and to reduce its intensity. Messrs. Musgrave Brothers, of Belfast, made one of the best patterns; for instance, their No. 3 size, 2ft. 4ins. by 2ft. by 3ft. 3ins. high, would effectually warm a space of 36,000 cub. ft. The Goldsworthy-Gurney stove, somewhat similar but circular, and standing in a pan of water, had been also largely used. Size C, 31ins. diameter, would warm a space of 30,000 cub. ft. When the stove was to be placed in an underground chamber a large furnace was commonly constructed with cast-iron sides and top, having extra large gills, as made by Messrs. Smith & Sons, of Barnard Castle, Durham; or an arrangement of flattened pipes laid backwards and forwards, through the interior of which the furnace gases passed while the fresh air travelled between the various pipes, as made by Mr. John Grundy, of Duncan Terrace, Islington.

Two sets of tests were made by the Coal Smoke Abatement Society upon domestic open firegrates in 1901-1903. In the first the "Florence" grate came out best; and in the second, with another group of grates, the "Tropicana" came out best—that was to say, produced the maximum of heat with the minimum of coal consumption and smoke.

"The Florence" Grate

was made by the London Warming and Ventilating Co., Ltd., and was described as fitted with improved "Jackson" back, Florence's patent automatic shaking fire-bars and combination canopy regulator. Its size was 21ins. by 28ins. The back and sides were of firebrick. It had a fire-chamber of 18ins. and a front of vertical iron bars. In each jamb at the hearth level there was a fresh-air inlet, and there was a heated-air outlet over the centre of the fireplace 6ft. above the floor level. The "Jackson" back and combination canopy regulator consisted of a sliding-door capable of easy manipulation from the front, which in its two positions allowed a careful regulation or adjustment of the two slotted openings—the one at the back of the firegrate and the other at the top. The smoke was drawn through the fire to a point where the heat was practically incandescent, and was consumed to a very appreciable extent. The automatic shaking bars consisted of a number of separate bars, preferably serrated or vandyked on their sides and upper surfaces. These were mounted loosely on a square shaft, so that the bars could rock to a limited extent on the shaft or could be rocked by operating the shaft by a handle. The bars were made abnormally deep in the body to heat the ascending air-currents. As the weight of the coal varied on the different bars, the bars would rock and clear the fire of ashes and dust, so allowing a continuous current of air at a high temperature to pass through the fuel, which caused it to burn brightly even in small quantities.

The "Tropicana" Grate

was owned by Messrs. Chavasse & Kerr, of Birmingham. The backs were of firebrick, usually with a corrugated front, and of vertical construction. The fire rested on a metal bottom, raised above the hearth, so that the heat might not be lost by conducting under the floor, and the ashes could be removed without extinguishing the fire. The bottom was so constructed that by means of a detached shutter the air could be entirely prevented from passing through the fire. To overcome the stagnation which would naturally ensue, a suction draught was introduced into the chimney through narrow passages formed in the brickwork. The air passing up these passages was heated by coming in contact with the firebrick, and was thus rarefied. The motive in this arrangement was to attain a more complete surface combustion, and to reserve and to utilize all the front heat generated in the

fire for radiation, while a small quantity of heat behind, which would otherwise be wasted, sufficed to stimulate a steady and reliable draught from the room through the chimney. A large radiating surface was employed, and canopies were discarded as unnecessary where this system was applied, there being no trouble from smoke. The inventors claimed that canopies were most detrimental to the heating power of any grate, and that the choice in grates where they were necessary was generally between a cold room and a smoky one. The fire in the "Tropicana" grate maintained for many hours a brilliant and glowing heat without perceptibly wasting away.

We had, therefore, said Professor Adams, a choice of good things, and there might be many others equally good which he had not mentioned, so that as far as domestic appliances were concerned we were endeavouring to secure a purer atmosphere.

ILLICIT COMMISSIONS.

Sanitary Inspector Suspended.

At a meeting of the Marylebone Borough Council last week a report was presented by a committee appointed to enquire into alleged irregularities on the part of certain sanitary inspectors in the service of the council. The committee reported that very serious allegations were made by a builder against one of the sanitary inspectors. The builder alleged that the inspector had been in the habit of recommending him to different persons requiring work to be done, and insisting on a commission being paid to him in respect of such orders, which commission was added to the contract price. It was represented that this practice continued from the year 1898 to 1902, when, in consequence of a dispute which the builder had with the inspector about the amount of some commission, the builder did not receive any more recommendations. The builder stated that all these payments were made in cash or notes, and he handed in a statement of eleven jobs, amounting to £906, in respect of which he alleged he paid the sanitary inspector £240. The inspector emphatically denied all these allegations, but admitted the existence of financial transactions between himself and the builder.

A resolution was passed that the sanitary inspector be suspended and the facts be reported to the Local Government Board. Mr. E. White intimated that he intended to send the evidence to the Attorney-General, with request to sanction a prosecution of the builder under the Public Bodies Corrupt Practices Act of 1889.

Law Cases.

Action against Welsh Architects.—At the Chester Assizes recently Mr. Justice Phillimore and a special jury heard an action brought by Mrs. Barnato, widow of the late Mr. Barney Barnato, against Messrs. Chadwick & Booth, architects, of Colwyn Bay. The plaintiff claimed damages from the defendants for alleged negligence in the supervision of the construction of a wall around her property at Colwyn Bay. The defendants counterclaimed 14 guineas fees in connection with the wall and commission on plans of a house, estimated to cost £4,000, prepared for Mrs. Barnato. The jury were two hours considering their verdict. They found that the defendants had been guilty of negligence and that the wall must be pulled down. They awarded the plaintiff £200 damages. On the counterclaim for £300, being 7½ per cent. commission for plans of a house estimated to cost £4,000, they awarded the defendants £80.

out, can he claim in the county court for the remaining £5, or does the fact of A writing on the face of the cheque 'in full settlement' preclude B from recovering the balance?"

If A has written "in full settlement of all claims" on the cheque, and B endorses it, we do not think B can have any further claim, because the endorsement is a tacit acknowledgment of what is stated on the other side of the cheque. We think, however, if B includes in the endorsement that the £17 is only on account, and that £5 is still due, he is in a position to take out a county-court claim for this amount.

Claim for Work Done but Omitted in Quantities.

ALPHA writes: "I am having some difficulty with an architect respecting work that was needed to complete a job as per drawings and specification, and was missed entirely, or understated, by the quantity surveyor. The job was taken at a very close profit. It was only a £3,000 contract, and the quantity surveyor's errors amount to more than £40. The quantity surveyor, although paid by the builder out of the first certificate, was employed either by the owner or by the architect—I have no means of finding out which, though I suspect it was the architect. The quantities are not part of the contract. Now the work is completed, I have sent in my account, but the architect has ignored those items which should have been provided in the quantities bill, but were not. If the architect can find any item in the quantities bill that is overstated I am quite willing for it to be deducted, but my experience teaches me that the errors of quantity surveyors are more often against the builder than otherwise. Am I legally entitled to be paid for the work? As the quantity surveyor is the servant of the owner or of the architect, are these two not responsible for the quantity surveyor's errors, as I am for my servants and employees? The quantity surveyor has been paid some months since, according to the conditions, and apparently I have no hold on him."

Your position in the matter is unfortunate, and we fear you have no redress. The contract being based on the drawings and specification alone, the fact that the quantities are incorrect does not vitiate it. Nor is the quantity surveyor liable. "Notwithstanding that the builder may become, as above explained, liable to the quantity surveyor for his fees and disbursements, the latter is under no liability to him for errors in the bill of quantities made without fraud" (A. Houston, K.C., in "Specification, No. 4"). We should think that the architect, if an honourable man, would endeavour to save a builder from the consequences of error by the quantity surveyor. But in law the latter is either a servant of the architect or of the building owner, unless the architect takes out his own quantities. The onus of seeing that the plans, specifications and quantities all agree is always laid upon the builder. We should advise you to see what you can do to move the architect.

Planning and Fitment of Workhouse.

LONDON.—F. C. writes: "It is proposed to pull down an old building in the centre of an existing part of a workhouse in the country, at present used for various trades by the paupers, and which gives a length of 48ft., and to erect in its place a dormitory or ward on the ground floor for infirm male paupers, 18ft. wide by 12ft. high, and over same on first floor a similar ward, say 10ft. high, for able-bodied paupers. In some cases the infirm would occupy the ward day and night. The wards face east and west. How many beds could be placed in each ward, the same being in two rows opposite each other? What distance should the beds be

placed apart, and what width are the beds? What is the best spacing of windows, and how many, if 3ft. by 8ft. 6ins. each, would be correct, built as for hospitals? Are the two fireplaces better placed one in each angle of either the end walls (north or south) or one at each end in the centre, or one in the angle of the building at either end? An entrance will be arranged for one in each end wall from the existing lobby. There is a staircase at either end of the existing building which would adjoin the proposed new building, constructed of wood, badly arranged, and no conveniences. Would it not be better to remove the two staircases, and give the space as an entrance or lobby, and build out in the rear new stone staircases and conveniences approached from the said lobbies in front and with door from staircases into yard at rear?"

After making allowance for new walls you will obtain a dormitory 45ft. 8ins. long. The following amount of space per bed, irrespective of that occupied by doors and fireplaces, is required by the Local Government Board:—For aged infirm, 5ft. wall space and 50ft. super. floor space; for able-bodied inmates, 4ft. and 34ft. respectively. It will be seen from the sketch plan below that you obtain on the ground floor sixteen beds for the infirm and on the first floor twenty-two beds for the able-bodied. The beds generally used are 2ft. 6ins. by 6ft. long, and they should be arranged to stand in their respective superficial amount of floor space. All dormitories over 30ft. in length require two fireplaces. In this case I suggest they be placed in the angles of the dormitory. The windows should be arranged as shown upon the plan, the sill

being about 3ft. above the floor and the frame extending to within gins. of the ceiling. It is most essential that the existing wood staircases be removed and in place thereof a new stone staircase provided. On one side of the existing lobby an annex may be arranged having lavatory accommodation on the ground floor and a slop sink, w.c. and bath on the first floor.

ALBERT C. FREEMAN.

[A recent book on the subject is Mr. Freeman's "Planning of Poor Law Buildings and Mortuaries" (7s. 6d. post free from these offices).

Building Dictionaries.

SHEFFIELD.—D. H. writes: "Is there a book published giving the technical terms used in building?"

There are several, such as Russell Sturgis's "Dictionary of Architecture and Building" (3 vols., 75s.) and Burns's "Glossary of Technical Terms used in Architecture and the Building Trades" (3s. 6d.). A glossary of building terms will also be found in "Specification, No. 3."

Heat Passing from One Floor to Another.

BIRMINGHAM.—ENQUIRER writes: "Is there any way of keeping the heat from penetrating through a ceiling into my office, as the rooms over have to be heated up to 200 degs. Fahr., and as there is only a 4½ in. cement-concrete floor between, the heat naturally comes through? Is there any plaster that could be used on the ceiling underneath to reduce this temperature, say, to 60 degs. Fahr. in my offices, or could anything be applied on the

floor over; or if the cement-concrete floor were to be taken out entirely, what would be the best floor to put in to prevent the unbearable heat?"

In our opinion the best thing you can do is to erect a false ceiling and pack between with slag-wool. No plaster would be effective.

Buildings to Measure on the Isle of Wight.

B. writes: "What buildings on the Isle of Wight are worth visiting in an architectural way?"

See the reply on p. 39 of our issue for August 19th, 1903.

Architects Abroad and in the Colonies.

LIVERPOOL.—W. H. W. writes: "I am an architect's assistant and have been out of a situation for six months. As there is no appearance of things changing for the better, I should be glad to know if there is any chance of getting a position abroad or in the Colonies."

As a rule, situations abroad or in the Colonies are to be obtained only by direct application on the spot, and we do not think you would be wise to go out on the off-chance. We have replied to similar enquiries before, as you will see by consulting back numbers. We can offer you no other advice than to advertise and to keep in touch with situations offered.

Stone Church: Drawings for the Academy.

SOMERSET.—PEN writes: "(1) Please give a short description of Stone Church, Kent. (2) What are the conditions to be complied with in submitting architectural drawings to the Royal Academy? Must the drawing be of a building, &c., already erected, or would one of a proposed building be accepted?"

(1) An illustrated description of Stone Church will be found in our issue for October 4th, 1899. (2) The drawing may be of a building erected or of one proposed. All drawings must be in gilt frames and have the title and the name and address of the architect on the back and on a label hung over the front. Full particulars can be obtained from the secretary of the Royal Academy at Burlington House, Piccadilly, London, from whom also labels can be obtained after a specified date.

Alleged Damage to a House.

CROYDON.—CONSTANT READER writes: "The owner of the property adjoining mine dug the ground out on top of my footings at the side of my fence, and left the road, which is 9ft. gins. wide, with a fall of gins., so that the water accumulated and ran back into my house at the ground level all along my flank walls. I took proceedings for an injunction—with what result you will see from the newspaper cuttings I send. Can you advise me what to do next?"

You are certainly in an unfortunate position, but in the face of the very clear judgment given I cannot advise any further legal proceedings (unless some fresh circumstances should arise in the future). You would, in my opinion, be only "throwing good money after bad."

F. S. I.

Angle of Slope for Coals.

IPSWICH.—C. C. writes: "What is the sliding angle of coals?"

Coals may be stacked with vertical walls, as in locomotive yards, where suitable lumps are used on the outside and the top layer is painted round with whitewash to show more readily that it has not been tampered with. Ordinary coals, left free, will stand at an average angle of 40 degs. from the horizontal, the exact angle depending upon the variety and size of the coal; in this condition it acts exactly like earth in producing a thrust against any wall or barricade retaining it. For coals to run down a screen to remove

the dust the average angle is 36 degs.; if they are damp they will run sluggishly, and if dry they will run freely. In a similar way an angle of 26 degs., or slope of 6in. in 1ft., is the average for a smooth iron or steel chute and 30 degs. for a wooden chute. Solid coal is estimated to measure about 40 cub. ft. per ton; coal stores are usually reckoned at 45 cub. ft. per ton; while the Navy allowance for bunkers is 48 cub. ft. per ton. By actual testing, a coal bucket of the nominal capacity of 18 cwt., and with an actual capacity of 35 cub. ft., will lift 16 cwt. best house coal, 18 cwt. gas coal and 23 cwt. Welsh steam coal; so that in any design the figures used must depend upon the class of coal to be handled. HENRY ADAMS.

The Martello Towers.

SOUTH WOODFORD.—"Is there a book published giving plans and particulars of the martello towers on the Kentish coast?"

We have made enquiries, but have failed to find any book containing illustrations of these towers.

Buildings to Measure near Whitby.

DARLINGTON.—IONIC writes: "Please give me a list of the chief architectural works of interest suitable to measure in or within a few miles of Whitby."

St. Helen's Abbey at Whitby affords plenty of Early English and Decorated features suitable for measuring: Near the abbey, on the edge of the cliff, is a fine Norman church, while Whitby Hall, a sixteenth-century mansion (restored), stands upon the site of the abbot's residence. At Ugglebarnby there is a church the greater part of which is Norman with later additions. The Norman fortress, Mulgrave Castle, is $3\frac{1}{2}$ miles from Whitby and is well worth a visit. Scalby is easily reached by rail, at which place an Early English church is to be found, and Scarborough, a few miles south of the last-mentioned town, possesses a fine castle and a church dedicated to St. Mary which contains work of a style transitional between Norman and Early English, as well as some pure Early English work. H. Y. M.

Obtaining an Appointment.

MANCHESTER.—SURVEY writes: "Please advise me as to obtaining a public appointment of some description. I am twenty-seven years of age and in an architect and surveyor's office. I have passed in the following subjects:—Carpentry and Joinery (Preliminary and Ordinary), Building Construction (Elementary and Advanced), Builders' Quantities (Ordinary and Honours), Surveying and Levelling, Sanitary Inspectors' Examination of the Royal Sanitary Institute, Institute of Sanitary Engineers' Examination. Is this sufficient to enable me to obtain a public appointment as district surveyor or assistant, or would you advise me to go in for the A.M.I.C.E. or Municipal Engineers, or F.S.I.? Which is best? Do you think with what I have already passed I should stand a good chance of passing? I am not a really good architectural draughtsman, and having little chance of starting on my own account I desire a permanent berth. Kindly say where particulars of examinations can be obtained."

The certificates named are sufficient for many appointments, but the difficulty is to obtain one. Except for the Civil Service appointments, it may be said that local influence is essential, but occasionally a stranger is appointed upon his merits, or rather upon his testimonials, which sometimes "are not what they seem." The best advice that can be given is to keep a vigilant look-out for all vacancies and to try for every suitable one; in the meantime to go on gaining practical experience and pass such examinations as are within the range of previous studies. The Municipal and County Engineers' examination would seem to be

the next one to take up; particulars may be obtained from the secretary, 11, Victoria Street, Westminster, S.W. After that the A.M.I.C.E. examination may be tried, but there is a great gulf between the two examinations that may be too wide to bridge. Particulars of the latter examinations may be obtained from the secretary, Institution of Civil Engineers, 25, Great George Street, Westminster, S.W. HENRY ADAMS.

GREEK RULES OF PROPORTION.

IN constructing their stone edifices the Greeks, who were reasoners and logicians, followed certain rules, and adopted for each edifice a certain fixed proportion. Take as an example the temple of Pæstum. The module is the mean radius of the column. This module measures 3ft. The column is ten times the module, or, say, 30ft. The distance between the axes of the column is five times the module, say 15ft. The total height of the entablature is also 15ft. The width of the abacus is three modules, equal to 9ft. Thus it is seen that all these numbers are multiples of three, which is the module. In this manner the proportions of the different members of an edifice have a constant relation to each other. It goes without saying that the module varies for each edifice; there is no single and absolute rule. For instance, in the Doric order the length of the column varies from ten to twelve modules; in the Ionic order from sixteen to twenty-one. The entablature of the Doric order measures five modules, and that of the Ionic only four.—(Jean Schoepfer, in the "Architectural Record Magazine" of New York.)

NO-BY-LAW COTTAGES.

The Absurdities in Present Regulations.

IN a second article on anti-building by-laws in the "Bournemouth Directory" Mr. R. M. Lucas, F.R.I.B.A., says: "To realize how very much the by-laws have lowered the standard of building one should search for a recently-built cottage of two storeys having walls thicker than the ordinary hollow 11in. Every one that I can think of belongs to the no-by-law period; and so do practically all of those whose beams are oak and whose roofs are close-laid tile. Cottage building has been reduced to the meanest possible. For centuries—in fact ever since building began—it steadily improved in response to the growing knowledge and the common-sense demands of the public, met by the enterprise of the builders. But now, where it is not absolutely at an end, it is only just above a set standard, and that a low one. Enterprise no longer influences the builder. And the reason of this wretched state of things is that by-laws prohibit the exercise of discretion by insisting on the unnecessary as well as on the necessary. Thus it comes about that a builder is in the position of a man who is told that every article of his clothing must cost the same price—if his boots cost £1, his coat must cost £1 and his hat £1. There must be no 3s. boots for hard tramping and no 5s. straw hats for hot sun! So that designer who can often distribute a given amount of brickwork to the advantage of the building's stability by thickening out here and thinning down there, is prevented from making use of its ingenuity, for the by-laws prohibit this by insisting on one least thickness everywhere. Builders are even forced to submit to an absurd interpretation of a by-law that no longer exists, in the case of walls that happen to rise above an adjoining building, such as a lean-to larder. Such walls are actually declared to be external throughout and are required to be built of

extra thickness in consequence in the lower storey, in defiance of the fact that this lower part, being enclosed, might be omitted altogether and the upper part supported by a girder, just as in the case of a bay window. . . . The very latest folly (quite recently evolved and of local growth) is to insist on party-walls being carried right through the cavities of the front and back external walls, apparently in order to make sure of letting in the damp. Prevention of fire is, I believe, the reason alleged—as if the very remote chance of fire spreading horizontally in a cavity-wall could not be dealt with in other ways. . . ."

THE BUILDINGS OF CALCUTTA.

CALCUTTA rather prides itself on being a city of palaces, and the fine mansions along Chowringhi may encourage the illusion. But the capital of India, less fortunate than Bombay, never had a Bartle Frere to embellish it, and too many public edifices of Calcutta are little better than imitations, says the "Standard." Government House is copied from Kedleston Hall, Derbyshire; the High Court was built on the model of the town hall at Ypres; Metcalfe Hall reproduces a portion of the Temple of the Winds at Athens. Nor, perhaps, are the pure Doric of the town hall at Calcutta and the Hindu-Gothic of the cathedral altogether suitable to their surroundings. But the Victoria Memorial Hall, designed by Sir William Emerson, will be the finest modern building in all India; and, in other ways, too, Lord Curzon will leave his mark on Calcutta. The plans for the improvement of Dalhousie Square doubtless owe much to his inspiration. An expert in landscape gardening who was consulted by the Bengal Government was in favour of removing the Dalhousie Institute, which, he thought, "interfered seriously with the artistic readjustment of the gardens," but this recommendation has not been accepted.

MONUMENTS IN JEOPARDY.

LORD WEMYSS, writing to the "Times," points out that Acts have been passed for the protection of ancient monuments, yet, strange to say, our cathedrals are left without legislative protection and are wholly at the mercy of their respective deans. The power of the dean is supreme, checked only by public opinion. Thus a few years ago the Dean of St. Paul's, Dean Gregory, took that building in hand, and Sir W. Richmond, R.A., was employed to cover the roof of the chancel of Sir Christopher Wren's great Renaissance work with Byzantine mosaics, for which the original stonework had in parts to be cut away. The walls also were decorated (!) by black stencilling around the arches. These stencillings, happily, remonstrant public opinion caused to be removed, and the stencilling hand of the Dean was stopped. "And now we have the Dean of Westminster removing and mutilating a monument erected in the Abbey by Parliament in honour of a gallant sailor—Captain Cornewall—who, having in the sea fight before Toulon had both his legs cut off by a chain shot, fought on while life remained to him. There is, unfortunately, no means of stopping the Dean's action save public opinion. His Majesty's Office of Works and Parliament are alike powerless. Now this practical destruction of an ancient monument is said to be caused by the necessity of finding in the Abbey space for a recumbent figure of the late Lord Salisbury. But if ancient historic monuments are thus, when a site is required for a modern statue, to be destroyed or mutilated and removed, where is this vandalism to stop?"

Coming Events.

Wednesday, August 2.

BUILDERS' FOREMEN AND CLERKS OF WORKS' INSTITUTION.—Meeting at 8 p.m.

Saturday, August 5.

NORTH OF ENGLAND INSTITUTE OF MINING AND MECHANICAL ENGINEERS.—Annual General Meeting at Newcastle, at 2 p.m.

A Large Dam across the River Leven, or Rannock Moor, in Argyleshire, is to be built to create a lake 7 miles long at an elevation of over 1,000ft. The works will be carried out for the Loch Leven Water and Electric Power Co. by Sir John Jackson, Ltd., and the expenditure is estimated to be little short of half a million sterling. The power created will be used by the British Aluminium Co., Ltd., for the production of aluminium.

The Extension of Bradford Town Hall is being carried out from plans by Mr. F. E. P. Edwards, the city architect, who has had the advice of Mr. Norman Shaw, R.A. The general plan consists of a hollow block of buildings, enclosed in a large internal area, which is subdivided by a central block containing the council-chamber. The alterations which will subsequently be made to the present building will principally consist of a re-planning of the main entrance hall and internal staircase, which it is proposed to reconstruct 12ft. wide, leading in three flights to the central corridor communicating with the principal room. The contracts already provide for the whole of the work up to the level of the ground floor, and amount to £10,969, but the total cost of the extension is estimated at £70,000.

New Companies.

THOMAS ROPER & SONS, LTD., contractors, builders, &c., Bruce Works, Sheffield. Capital: £11,000.

CHARLES COTON & CO., LTD., builders, decorators, &c., Bexley, Kent. Capital: £3,000.

MAGIC WINDOW BALANCE CO., LTD., window frame and sash manufacturers. Capital: £3,500.

PORT TALBOT BRICK CO., LTD., Port Talbot, Glam. Capital: £10,000.

Advertising Notes.

To succeed a man must make his talents known. Success comes quickly to those who advertise.

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterward, prepaid. Three insertions may be had for the price of two. Advertisements must reach the Office not later than 5 o'clock on Friday.

ARCHITECT and SURVEYOR'S ASSISTANT desires ENGAGEMENT, 3½ years' varied experience, able to prepare working drawings from rough sketches; surveying, levelling, &c.; moderate salary.—X., 48, Thornton Avenue, Chiswick, W. 1240

ARCHITECT and SURVEYOR'S experienced and capable all-round ASSISTANT desires permanency. Thoroughly well versed in quantities, working drawings, construction, steelwork, details, surveying and levelling. Moderate salary.—H., Preston Villa, Markenfield Road, Guildford. 1238

ARCHITECT and SURVEYOR'S ASSISTANT, A.R.S.A.I., desires ENGAGEMENT; 10 years' varied experience. Measuring up, contract drawings, details, specifications, knowledge of quantities, surveying and levelling, superintending works.—Box 1278, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C. 1238

ARCHITECT'S ASSISTANT (24) desires ENGAGEMENT. Good draughtsman. Designs, working drawings, details, perspectives, specifications; nine years' experience.—W. H. L., 83, Elspeth Road, Clapham Common, S.W. 1210

ARCHITECT'S Junior ASSISTANT (22½) desires SITUATION. Excellent draughtsman, well up in construction, working drawings, measuring and plotting, specifications. Could assist with quantities. Six years' experience.—S. W. H., Brookdale, Manor Road, Teddington. 1263

ARCHITECT'S ASSISTANT (32), Experienced Draughtman and Designer, specifications and quantities, 55s. Country preferred.—TRAHO, 186, Worple Road, Wimbledon. 1237

ARCHITECT'S ASSISTANT requires situation; contract drawings half and full size, details, surveying, &c., and general office work. Moderate salary.—Box 1232, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C. 1232

ARCHITECT'S ASSISTANT (23), six years' Midland experience, chiefly domestic; surveys, working drawings, details, &c.; low salary.—Z., "Ingleside," Olton, Birmingham. 1253

ARCHITECT'S ASSISTANT, 21 years' general and public experience; competent quantity surveyor. First-class references. Salary, 3 guineas.—Box 1261, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C. 1261

ARCHITECT'S ASSISTANT (24) disengaged; competent; working drawings, all details, specifications; assist with quantities, land survey, &c.; moderate salary.—Box 1277, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C. 1277

ARCHITECT'S Junior ASSISTANT (20) disengaged September 4th. Five years' experience. London or country. Working drawings, details, good tracer, colourist, &c. General office routine. Salary 25s.—A. G. S., "Kirkdale," Stanmore Road, Leytonstone, Essex. 1279

BUILDER'S, &c. CLERK OF WORKS ASSISTANT (22); drawing, tracing, knowledge quantities and details; 4½ years in architect's office; certificates, building construction, advanced, 1stfr. hand, &c.—H. M. N., Thorncroft, Farnham, Surrey. 1243

BUILDER'S WORKING FOREMAN seeks permanency in private or jobbing firm in London district. Well up in all branches, plans, and details. Trade, bricklayer. Good references. Abstainer. Aged 30.—Wood, 80, Selwyn Avenue, Higham's Park, N.E. 1269

CARPENTER and JOINER with 16 years' experience, wants piecework labour only or as working foreman; good references; distance no object; estimates given.—Apply, D. W., 58, Wellington Street, Gravesend, Kent. 1208

CLERK OF WORKS, good draughtsman, setter-out, sanitary engineering, quantities, seeks position as ASSISTANT; thoroughly practical, trustworthy, and reliable.—D., 9, Lambeth Palace Road, London, S.E. 1242

CRANE or ENGINE DRIVER FITTER, take charge of plant, thoroughly experienced; young man seeks situation.—F. W., 1a, Comboss Road, White Post Lane, Victoria Park. 1276

ELECTRIC LIGHTING, BELLS, TELEPHONES, &c. First class workmanship, moderate charges, estimates free.—G. CORNER, 3, Laurel Grove, Sydenham, S.E. 1224

FOREMAN of JOINERS seeks situation with a firm which turns out first-class work. Accurate setter out. Good references.—Box 1231, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C. 1231

GENERAL FOREMAN, just finished contract, wants RE ENGAGEMENT. Thoroughly competent in all branches. Energetic and reliable. Punctual time-keeper. Excellent London references.—G. T., Netherbrook, Nether Street, Finchley, N.E. 1263

GENERAL or WORKING FOREMAN (Carpenter). Building alterations, or sole charge, good jobbing. Good Manager of men. Practical experience in all branches.—W. A., 88, Siebert Road, Westcombe Park, S.E. 1227

MACHINIST. Competent spindle and all round hand; first-class saw sharpener, cutter maker, &c. Good references.—Box 1260, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C. 1260

MACHINIST (Joiners), spindle, tenon, general joiner, moulding, machines, &c.; all round hand; take charge and set out if required; good references and reliable.—JOINER 65, Fairfield Road, Bow, E. 1265

MACHINIST (24), spindle hand improver; can also work saw bench, band saw, overhead and panel planer; make cutters, sharpen saws.—MACHINIST, 18, Lausanne Road, Peckham, S.E. 1266

PAINTER.—Good all-round hand wants JOB, town or country. Abstainer.—A. R., 43, Bassett Street, Kentish Town, N.W. 1236

PAINTER.—WORKING FOREMAN desires ENGAGEMENT. Good all-round man in all branches of the trade. Refs.; abstainer.—F. R., 43, Bassett Street, Kentish Town, N.W. 1235

PLUMBER, GAS and HOT WATER, seeks Situation; able to take charge of Estate work, can fill up Painting. Abstainer.—A. M., 167, Griffin Road, Plumstead. 1252

PLUMBER (young), gas, hot-water, zinc, electric bells, well up in the latest sanitary improvements, used to speculating work or good shop.—M., 52, Poplar Walk Road, Herne Hill, London. 1239

PLUMBER.—Reliable Man REQUIRES JOB or CONTRACT for Sanitary Work.—W. PHILLIPS, 9, Selwood Street, Rotherhithe, S.E. 1209

QUANTITY SURVEYOR'S ASSISTANT (22). Working up, &c., also neat draughtsman. Moderate salary.—Box 1223, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C. 1223

TO ESTATE and PROPERTY OWNERS. A thorough practical Speculating Builder, who has covered large estates, desires the management of an estate. Superintending and carrying out any class of building, alterations or repairs. Would cover an estate for freeholder with large or small property on arranged terms, undertaking to give all services usually rendered by a builder.—C. F., Springfield Cottage, Horn Lane, Acton, W. 1280

YOUNG ARCHITECT, 7 years' London and provincial experience, and passed part of R.I.B.A. Final, desires further London experience in designing and execution of buildings. Would accept position in good office without salary. 1264

Appointments Vacant.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterward, prepaid. Three insertions may be had for the price of two. Advertisements must reach the Office not later than 5 o'clock on Friday.

BRICKLAYER FOREMAN.—WANTED a thoroughly competent man to take full charge. Apply, with testimonials, and state wages required, J. W. WHITE, Contractor, High Barnes Works, Sunderland. 1240

MANAGER WANTED FOR DECORATOR'S and GENERAL BUILDER'S business (London). Must be of good address and able to take management, including estimating without supervision. Rent, rates, and taxes free. Send full particulars of qualifications, salary expected and references to "MANAGER," c/o Hooper & Batty, 15, Walbrook, E.C. 1240

NORTHERN POLYTECHNIC INSTITUTE, Holloway, London, N. — The Governors of the above Institute invite applications for the following appointment:—CHIEF ASSISTANT in the Building Trades Department, salary £150. Applications to be made on special forms, which must be returned not later than 24th July, to be obtained from W. M. MACBETH, Secretary. 1240

YOUTH WANTED for Architect's London Office.—Address, with full particulars, Box 1226, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C. 1226

Drawings, Tracings &c.

ARCHITECTURAL DRAUGHTSMAN desires to ASSIST during his spare time in the preparation of contract or competition drawings. Ten years' London experience. Moderate charges.—E. C., 100, Archway Road, N. 1205

DESIGNS for SUBURBAN RESIDENCES prepared to suit clients. Plans and Specifications for new work and alterations. Drain Plans at specially low fees.—J. LAWRENCE, jun., M.R.S.I., A.I.S.E., 112, Shirland Road, W. 1205

DRAWINGS from rough sketches, designs, details, specifications, drain plans and quantities prepared. Terms moderate.—J. W., 8, Rylett Crescent, Shepherd's Bush, W. 1241

TO ARCHITECTS.—Assistance given in all work at advertiser's home. First-class Tracings made.—A. MANDER, 16, Lonsdale Square, Barnsbury, N. 1251

Businesses Wanted & For Sale

FOR SALE.—Jobbing Builder's and Decorator's business, paying over £2,000 in wages per annum. Unique position; exceptional opportunity; established 17 years; £2,600. Box 1275, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C. 1275

FOR SALE.—Old Established Builder's and Decorator's Business in the West of England, turnover over £1,800 a year.—Box 1217, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C. 1217

OLD-ESTABLISHED BUILDER and DECORATOR'S BUSINESS for sale in Kensington neighbourhood. Turnover, average for past two years, £2,100. No agents.—Address, A. E. DAVIS, Chartered Accountant, 18, Ironmonger Lane, London, E.C. 1217

Offices & Wanted & To Let

SHARE OF OFFICES.—An Architect with offices adjoining Bedford Row can accommodate another. Terms £18.—Box 1201, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C. 1201

SHARE OF OFFICES.—Provincial Architect will share his City offices with Quantity Surveyor or another Architect.—Box 1225, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C. 1225

Partnerships.

YOUNG ARCHITECT, 10 years' London and provincial experience, of artistic and practical ability, desires ENGAGEMENT with Architect with a view to purchasing Junior Partnership. Highest references from some of the most influential members of the profession. Speciality: Domestic work.—Apply, Box 1262, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C. 1262

Miscellaneous.

AGENCY WANTED FOR HIGH-CLASS GOODS for Sanitary Work or Machinery of every description. A large connection with Councils Engineers, Contractors, &c. Good Central London Showroom can be had. Terms liberal.—Apply Box 1222, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C. 1222

MARBLE AND GRANITE WORK. Speciality, Shopfittings, Steps, and Monuments.—KELLY & Co., Masons, Mill Hill, N.W., also Kilburn N.W., and Harpenden, &c. Telephone, 1159 Hampstead. 1240

SAWN OAK PARK PALING, 6 inches wide, 4s. 100 ft. run.—MAY and BUTCHER, Timber Merchants, Heybridge, Maldon, Essex. 1240

TO BUILDERS and HOUSEBREAKERS. Wanted, old Lead Roofings, Gutters, Pippings, &c. Contracts entered into for regular deliveries.—Send particulars and prices to J. A. FULLILOVE, Market Harborough. 1240

TO BUILDERS.—Builders will be Financed on Estate, Kingston-on-Thames District; must have good references and capital for starting.—Apply Box 1220, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C. 1220

TO SANITARY ENGINEERS and OTHERS. Seven or eight up-to-date Sanitary and Domestic Patents by a specialist for Sale.—Apply Box 1221, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C. 1221

MONTHLY

FIRE SUPPLEMENT

TO THE

BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

Edwin O. Sachs, F.R.S.Ed., Architect,
Consulting Editor.

Number 10.
August, 1905.

COMPARATIVE COMBUSTIBILITY OF TIMBERS.

By G. R. CHERRY, Sydney, N.S.W.

IN these latter days, when in every quarter of the world are eager scientific workers ever on the outlook for an unoccupied field in which to pursue their researches, it can only be by rare good fortune that a humble outsider should stumble by a happy chance upon a territory hitherto unexplored. It would seem, however, that this is actually what has happened with regard to the singularly important matter which forms the subject of my present article.

The nearest approach to anything of the kind that I have been able to discover were the interesting experiments conducted in 1902 by Prof. Ira H. Woolson, of Columbia University, New York, and Prof. Charles L. Norton, of the Massachusetts Institute of Technology, in testing the fire-resisting qualities of so-called "fireproof" wood, and which are recorded in "Insurance Engineering" of that year. I am indebted to Professor Woolson for his idea of recording the duration of the flame and glow after the conclusion of the test.

By availing ourselves of the published works of the various scientific men who have devoted themselves to the study of our Australian timbers we are able to acquire very much valuable information regarding them. To the student desirous of ascertaining the economic value of this great national asset—the enormous importance whereof will possibly not be realized by us until too late—those works which would be of the greatest use are "Australian Timbers," by Prof. W. H. Warren, of the Sydney University, and "Research on the Eucalypts," by Messrs. R. T. Baker and H. G. Smith, of the Technological Museum, Sydney. The former work deals with the subject from the viewpoint of the engineer, and gives the transverse, tensile, bearing and compressive resistances of all the most valuable timbers; whilst the latter is the result of the collaboration of a botanist and a chemist, and gives the exact chemical constituents of the various trees based on a scientifically accurate determination of each variety dealt with.

It would be a quite unwarranted presumption for me to range myself by the side of these distinguished men, but I confess to cherishing the hope that my work may—*ingo intervallo*—be regarded in some measure as a continuation of theirs, as being another contribution to our store of knowledge concerning the specific value of our native timbers.

It is sometimes interesting to trace the genesis and growth of an idea. Some five years ago Mr. Charles Hedley told me that the wood of the *Syncarpia laurifolia*, or

turpentine tree, was distasteful to the "termite," or "white ant." As I had been just looking at the fibrous mass which represented a portion, one of the massive ironbark girders, taken from the building of the Australian Museum after having been operated upon by the aforesaid termite, this seemed to me to be a very important fact. I already knew that this timber was difficult to burn, and that in salt water, used as piles, it resisted the attack of the ship-worm. I accordingly thought that there must be some very vital reason for the preference shown by local builders for ironbark, and concluded that it must be some defect in the direction of its strength. On looking the matter up in Professor Warren's "Australian Timbers" I found that, compared with the very best ironbark (*Eucalyptus crebra*), the difference was only one of degree, the figures given for turpentine wood being very good indeed.

I then thought I should like to ascertain the relative inflammability of ironbark and turpentine wood, and in order to do this I had to design the machine which is here illustrated. Having gone thus far, I concluded that it would be just as well to extend the comparison so as to include the principal Australian timbers and also as many as I could get of the commercial timbers from other countries available here. I should not have been able to do this had I not been so fortunate as to enlist the enthusiastic co-operation of Mr. R. T. Baker, the Curator of the Technological Museum, who met my appeal for assistance in the spirit of the true scientist. He at once offered to help me to the fullest extent of his power, and he has furnished me with specimens of nearly all the timbers dealt with in my paper—each of these specimens being exactly the same size, and planed up so beautifully that I felt loth to burn it, and that each was furnished with its true scientific and local name. The value of his collaboration was enormous.

The Testing Machine.

The testing machine, or "xylopyre" (*xylon*, wood, and *pyrōo*, to test by fire) consists of four steel rods 15 ins. long, rising from each corner of a steel base 6 ins. square. These rods converge together at the top, where they embrace the upper end of a brass tube 6 ins. long, the lower end of the said tube being braced to the rods. At a distance of 5½ ins. from the base the rods are connected by a platform made of stout wire, and upon this platform, which is 4 ins. across, rests the little log of wood (6 ins. by ½ in. by ½ in.) which is to be tested. Across the centre of this log is placed the chisel-shaped end of a steel spindle, which travels vertically in the brass-guiding tube, the top of the spindle being weighted. A spiral brass spring is fixed to the top of the machine so as to relieve it from the jar of the weighted spindle when the test is completed. A gas-burner is so

arranged that a "rat tail" flame 1½ ins. long impinges on the lower surface of the wood. This is so regulated that the conditions of test shall be identical in every case. The weighted spindle weighs 448.84 grammes (15.71 ozs. avoirdupois). The test begins when the log is placed in position over the gas jet, and ends when the spindle falls. The time is taken by a stop-watch measuring fifths of seconds. I submitted the machine to Professor Warren before doing any work with it, and he honoured it with his approval and considered that it should do what I required of it. It has done its work in a manner that reflects credit upon its maker, Mr. Robert Boxall.

Explanation of Tabulated List.

The timbers are arranged in the order of their fire resistance. The number in the first column is that of the specimen. Then follow the scientific and local names of the timbers, the column headed "Test" giving the time in minutes and seconds of the endurance; that headed "Flame" giving the time during which the flame (if any) endured after the conclusion of the test; and that headed "Glow" showing the duration of the glow (if any) after the flame had expired. The weight of each test log is given in grammes and ounces avoirdupois so as to facilitate reference by users of the metric or British systems.

Test Logs.

The test logs measure 6 ins. long by ½ in. square (15.24 centimetres long by 12.70 millimetres square). It will therefore take ninety-six of these little logs to make a plank 1 ft. square by 1 in. thick; twelve of these planks taken together equal a cubic foot. If, therefore, we take the weight shown in the table for a test log in ounces avoirdupois, multiply this by 96, and divide the result by 16, we should get the weight in lbs. of a square foot of the timber 1 in. thick, and by multiplying this again by 12 we get the weight in lbs. of a cubic foot.

A cursory glance at the tabulated list will show that the great majority of our native timbers offer a better resistance to fire than the foreign timbers tested. The very low comparative resistance offered by Rangoon teak and English oak is rather instructive. From amongst our native timbers, however, there are two that stand head and shoulders above the rest. They are *Eucalyptus Fletcheri* and *Syncarpia laurifolia*, and I shall chiefly confine my remarks to these.

Eucalyptus Fletcheri (R. T. Baker), "Lignum Vitæ" or "Box." (Test 19 min. 17 sec.). This is a medium-sized tree. The timber is pale-coloured, but brown towards the centre, and is very hard, tough and durable. No practical use can apparently be made of this timber, and it is now comparatively rare, or, at least, its geographical distribution is not well known. So far as is at present known, its natural habitat is

restricted to the watershed of the Nepean river, and owing to its good qualities it has been extensively cut by timber-getters; so that, with the exception of some few specimens which still remain at Thirlmere, it is almost extinct. It is to be hoped that Germany has already supplied herself with some of the seed, so that in time to come, when the value of this timber is appreciated by us, we may be able to secure an occasional shipment from the other side of the world. It is almost too much to expect that our local authorities will take any steps towards perpetuating this species before it is too late. In the meantime, however, we can only record the fact of the remarkable fire-resisting properties possessed by this timber, and regret that our builders are at present unable to avail themselves of it.

Syncarpia laurifolia (Tenore), "Turpentine Tree." (Test 12 min. 58 sec.) From 120ft. to 180ft. is not an unusual height for this tree, and it often measures 20ft. to 30ft. in circumference, with great length of bole. It grows throughout the coast districts of New South Wales, extending into Queensland on the north, its southern limit being the head of Cockwhy Creek, between Ulladulla and Bateman's Bay. It is common in the following countries of New South Wales, viz., Camden, Cook, Cumberland, Dudley, Raleigh, Durham, Fitzroy, Gloucester, Hunter, Macquarie, Northumberland, Rous, St. Vincent and Westmoreland, and covers an area totalling 540,337 acres.

Mr. J. H. Maiden, Government botanist, and Mr. J. V. de Cocque, timber expert, Public Works Department, in a report made by them in 1895 give the following characteristics of the timber: "Turpentine is, for a hardwood, soft when green but hard when dry. It is of a sandy or gritty nature, rapidly dulling the saws, hence sawmillers do not like it. It splits and shrinks badly in sawn sizes free from bark, unless some attention is given to seasoning it. It is very durable when placed in the ground, and a great recommendation for many purposes is the difficulty of burning it."

Mr. Maiden, in the "Agricultural Gazette," 1894, says: "In a certain suburb some carters did a roaring trade in 'ironbark' firewood, at a rate very much below that ruling for ironbark. When the wood began to be used complaints were very general, for it would burn with difficulty. I found that the wood was turpentine and that the enterprising carters had been clearing a turpentine paddock about two miles away." He also says, in "Forest Flora of New South Wales": "It is not easy to burn except with a good draught. In such situations as pillars, girders, &c., in buildings it usually only chars, and is in consequence easily extinguished." He relates an instance of a case where in a large fire in Sydney the girders and joists, which were of turpentine, were put to a very severe test without giving way, and thus saved the building from being gutted. He also states that the timber is very resistant to white ant.

Mr. de Cocque, in "Journal of Royal Society," 1894, says: "I have yet to see any hardwood these pests (white ants) will pass by if pushed for sustenance, except perhaps true turpentine. This timber, which grows in abundance between Gosford and Teralba, bears a splendid record for durability, and does not warp or twist like that from northern rivers."

To architects I would particularly recommend this timber, especially from the district mentioned above. It should never be used in sawn sizes unless cut from fully-grown trees. It is easily worked, but is extremely short in grain; consequently it will not bear much breaking strain, but in all other parts of a building I can speak of it in terms of praise. A feature of turpentine is that white ants rarely ever touch it, green or dry. Another strong recommendation is that it will not burn; it chars, but will not ignite.

If you put a turpentine log on a fire the chances are that it will go out.

Mr. Augustus Ruddet, in "Agricultural Gazette," 1896, says: "The timber of this tree is fairly lasting, but is apt to rend and warp a good deal in sawn stuff in the seasoning, but this, so I am informed, is entirely obviated by a few weeks' soakage in water, and I have seen it after this treatment free from cracks."

It is interesting to note that this tree is very nearly related to the New Zealand "Rata," which has in common with the turpentine, the valuable properties of durability and resistance to teredo. Unlike the turpentine, however, the rata makes excellent firewood, although difficult to split. Turpentine wood is usually dull red in colour, but varies from that to brown or purple brown, and has a good grain.

For purposes of comparison I have extracted the following figures from Professor Warren's "Australian Timbers," being the

LABORATORY TESTING EQUIPMENT USED FOR INVESTIGATING THE RELATIVE COMBUSTIBILITY OF WOOD.

average results given by the best seasoned specimens:—

	Iron- bark.	Turpen- tine.
Transverse strength:		
Modulus of rupture in lbs. per sq. in. - - -	20,452	16,591
Compressive strength:		
Breaking load in lbs. per sq. in.—		
12ins. by 3ins. by 3ins. (4 to 1) - - -	12,307	9,885
24ins. by 3ins. by 3ins. (8 to 1) - - -	11,048	9,139
48ins. by 3ins. by 3ins. (16 to 1) - - -	10,666	8,595
72ins. by 3ins. by 3ins. (24 to 1) - - -	8,538	5,580
Tensile strength:		
Breaking load in lbs. per sq. in. - - -	21,845	19,003
Shearing strength:		
Breaking load in lbs. per sq. in. - - -	2,160	1,775

According to Professor Warren, "the transverse strength of ironbark timber is half that of good cast-iron, the tensile strength half that of good wrought-iron, and for strength, elasticity and durability combined it is unrivalled." Ironbark, however, is very

much appreciated by white ant, and in point of resistance to fire the better known ironbarks (such as *E. paniculata* and *E. crebra*) rank below many others of our native timbers, although in this respect when compared with European, American or New Zealand timbers they are greatly superior. The best ironbark is yearly becoming more difficult to obtain owing to the great demand for it.

In the timber of the *Syncarpia laurifolia* we have one that is specially non-combustible; it is distasteful to white ant, and in point of strength gives results not badly behind those recorded for ironbark. It is, moreover, obtainable in any size and at a cheap rate, and the supply will take many years to exhaust. All of these factors are of importance in assessing the value of a timber as regards its use in building construction, and when we find all these factors in combination some very potent reason indeed must be brought forward to explain how it comes about that we scarcely ever hear of turpentine being used otherwise than as piles for wharf building.

Architects and builders will probably say that it does not season well; but inasmuch as it has been shown that it can be seasoned in such a manner that the result is a beautiful rich-coloured timber, free from shakes and flaws, the fact that it is not properly dealt with seems to point rather to lack of care or knowledge on the part of the timber merchant, and should not be laid to the debit of the timber itself. It may be also alleged that when built into a structure whilst green it is given to warping. But this is a trouble that is common to a greater or less extent with all our valuable hardwoods, and the remedy seems to be for architects to specify that none but properly seasoned timber shall be employed. These, however, are technical matters which can be much better handled by the professional architect and builder. I have now made out my case for the turpentine, and will let the matter go to judgment.

I am very glad to have at last dealt with this matter, which has often occupied my thoughts during the past five years and has filled up all my spare time during two months. To the scientific man, properly equipped both mentally and physically, knowing exactly how the research should be conducted, and provided with an up-to-date laboratory in which to work, these results may appear rather meagre. I have, however, done the best I could with crude and unscientific appliances to ensure correct results, and perhaps some of our American or British "fellow-labourers in the vineyard" may take up the idea and with the aid of their splendidly-equipped laboratories carry it to a correct and scientific conclusion. I have not by any means exhausted the field. My specimens comprise most of the Australian commercial timbers, but only a very few from other countries, and in each of those countries a similar research into the relative combustibility of the local timbers would be of great value to the local underwriter.

In order to facilitate such research I have fully described the machine and method of testing which I have adopted, so that the conditions may be reproduced without much difficulty. Specimens should be taken from the best part of the timber, and not from those portions which are rejected commercially, such as sap or heart-wood, as the case may be. The timber must also be perfectly seasoned. In order to obtain a standard of comparison I would suggest that in the event of an American taking up the idea, he should procure a number of test logs (6ins. by 3ins.) of Californian redwood, for instance, and keep on burning them until he gets the same result as myself. He could then feel pretty certain that his machine was properly adjusted. An Englishman could in the same way make use of oak, teak or Baltic red deal for this purpose.

AUTOMATIC SPRINKLERS.

THE introduction of automatic sprinklers is gradually becoming so common that the time has really arrived when architects and engineers should accord some attention not only to the question of introducing sprinklers generally, but investigating the character of the sprinklers used.

At the moment they are guided entirely by the reports of the Fire Offices Committee, who either pass the sprinkler as efficient for insurance purposes, or not, without giving the whys and wherefores or any particulars regarding the character of the tests they undertake.

Some time back we published a report of an automatic sprinkler in respect to which a test was undertaken by the British Fire Prevention Committee, and their methods of testing such appliances was thus explained.

We find, however, that the American practice of investigating automatic sprinklers is far more elaborate, and, having regard to this, we think it should be of common interest to architects engaged in the erection of business premises to have some information regarding American practice, and for this purpose we are presenting herewith a specimen specification of what is required in the way of tests by the insurance corporations of the United States:—

I. HYDROSTATIC PRESSURE.

(a) LEAKAGE.—One hundred (100) sprinklers are connected one at a time in a pendant position to a hand-wheel hydrostatic pressure ram equipped with a spring gauge reading from 0 to 2,400 lb. per sq. in., and water is brought in contact with their seats.

Readings of leaking points are taken and the average computed. The highest, lowest and number leaking below 300 lbs. are noted. Second readings are taken at intervals varying from 30 to 300 days, the average again computed, and the highest, lowest and number leaking below 300 lbs. again noted.

(b) N.B.—Spring gauges. The gauge used in the foregoing tests and all spring gauges used in the following tests and as parts of all apparatus are calibrated after each experiment, a Crosby gravity-operated gauge tester being used for the purpose. All readings given are corrected readings.

(c) STEADY PRESSURE.—The sprinklers are connected to a heavy L-shaped cylinder, the upper end of which is used as an expansion air chamber. A constant hydrostatic pressure of 300 lbs. per sq. in. is maintained on these sprinklers for a period of 3,700 hours and notation made of any leakage under these conditions.

(d) WATER HAMMER.—The sprinklers

ONE OF THE STONE STAIRCASES THAT COLLAPSED.

13. HOT FLUID.

(a) FUSING POINT IN WATER. — Standard-degree sprinklers are immersed in 1 gallon of water held in a granite-ware vessel, and the temperature of the water is gradually raised to 100 degs. Fahr. (+ 38 degs. C.). Above this point the temperature is raised at a rate not exceeding 2 degs. Fahr. (1.1 degs. C.) per minute, the water being stirred to ensure uniformity. Temperatures are measured by 600-deg. Weiskopf thermometers, the bulbs of which are adjusted on a level with the soldered links of all the sprinklers. The thermometers, the gas flame used for heat and all of the apparatus are protected from draughts of air. Readings are taken of the temperatures recorded by the thermometers when the sprinklers open, and their actions in opening are noted.

(b) PLUNGE IN WATER. — Standard-degree sprinklers are allowed to stand for at least one hour in an enclosure having a constant temperature of 60 degs. Fahr. They are then quickly removed and immersed one at a time in a pendant position in a water bath having a constant temperature of 170 degs. Fahr. (+ 77 degs. C.). Readings are taken of the time elapsing before operation, and their action in opening is noted.

(c) FUSING POINT IN OIL. — High-degree sprinklers are immersed in 1 gallon of melted leaf lard held in a granite-ware vessel, and the temperature of the oil is gradually raised to 150 degs. Fahr. (+ 66 degs. C.). Above this point the temperature is raised at a rate not exceeding 2 degs. Fahr. per minute, the oil being stirred frequently to ensure uniformity.

Temperatures are read from 600-deg. Weiskopf thermometers whose bulbs are adjusted on a level with the soldered links of all the sprinklers. The thermometers, the gas flame used for heat and all of the apparatus are protected from draughts of air. Readings are taken of the temperatures recorded by the thermometers when the sprinklers open, and their actions in opening are noted.

4. RECORD OF DISTRIBUTION.

5. DESIGN AND CONSTRUCTION.

- (a) Effects of blows.
- (b) Effects of excessive tension or compression.
- (c) Uniformity of parts and workmanship.

6. MISCELLANEOUS.

7. RECORD IN SERVICE.

Notations are made of—

- (a) Number of sprinklers in actual service at date of test.
- (b) Greatest length of time any individual risk has been equipped.
- (c) Field record.

8. SUMMARY.

THE FIRE AT THE "COMEDIE FRANCAISE," PARIS.

IT is generally exceedingly difficult to obtain useful particulars of any theatre-fire, and frequently months or even years elapse until it is possible to present anything like a plain unvarnished picture of a fire of this kind. There is the sentimental aspect, generally due to the loss of life; there is the official aspect, generally due to a desire on the part of the public officials to make capital out of the fire for furthering future legis-

lative schemes; there is the managerial aspect, due to a desire to show the excellent condition of the theatre at the time of the outbreak. In fact, no fire is surrounded by so much mystery as a theatre-fire.

To-day, some years after the fire, we can, however, safely present a translation of the actual occurrences at the Theatre Francaise fire, which at the time created such a sensation, acrimonious discussion and mud-throwing in Paris. Fortunately the fire was midday, when the public were not in the building, and there was only one fatality. There was thus nothing very frightful about this fire. It was, as a matter of fact, a very commonplace one. But, for all that, it demonstrated some forcible lessons.

We illustrate the particulars with some excellent photographs, of the fire in actual operation and of the ruins of the auditorium. We also publish a plan and smaller view. We trust that particulars and illustrations together may prove instructive.

The Fire.

(Translated from the French.)

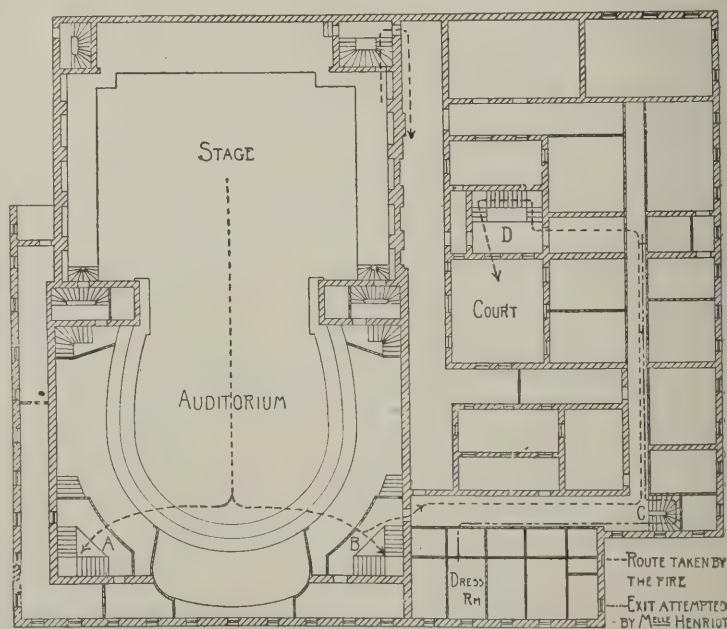

The exact hour at which the Comedie Francaise fire broke out is not known, nor has its cause ever been ascertained. Both commencement and cause thus curiously remain a mystery. Telephone and "fire-calls" messages both from the theatre and adjoining property were received by the fire brigade in rapid succession and resulted in the firemen attending in great force.

In the interior almost every hydrant was brought into immediate operation. Externally however it was difficult to get to work owing to the height of the building, and it was probably the delay in getting to work on the roof that caused popular opinion to decry a supposed lack of water. Owing to the danger of the spread of the flames to adjoining property

(the Cour des Comptes et le Conseil d'Etat) six additional heavy steam fire-engines were brought to the scene of the fire solely for the protection of adjacent risks.

The fire rapidly spread to the scenery store, the stage and the auditorium, the flames getting through wherever they had a chance to. From there the fire worked its way through the upper floor to the stone staircases (A and B), and these stairs were not long in giving way. At the third and fourth storeys on staircase "B" there were unfortunately means of communication by iron doors to the dressing-room wing, and these doors were open. These opened on the passage leading directly on to the dressing-rooms. The flames passing through these doorways,

feet

PLAN OF THE THEATRE AT THE TIME OF THE FIRE.

THE FIRE AT THE THEATRE FRANCAISE PARIS. (Showing the actual fire in progress).

entirely destroyed the passages, *i.e.*, to a distance of 40 m. (about 130ft.). Thus the whole of the side of the theatre towards the Place du Theatre Français was damaged, as well as the part facing the Rue Saint Honoré. These iron doors were doubtless always kept open, as they are the means of communication to the Rue Richelieu (including all the offices of the theatre) and that part of the theatre opening on the Rue Saint Honoré. The fire also spread to the third floor and the wardrobe room by an iron door which had been wedged open, and this store was considerably damaged. Dressing-room No. 42 (belonging to Mlle. Henriot) was situated on the fourth floor in that part of the theatre facing the Rue Richelieu and in close proximity to staircase "B." The unfortunate artist was unable to avail herself of this staircase because the current of smoke and flame was apparently against her. She descended one floor and reached a dressing-

room on the third floor, intending to gain staircase "D," but was overcome here at a point indicated by a cross on the plan. If this artist had descended to the second floor by staircase "C" she could have saved herself, as the second floor had not been touched. She might also have been saved if she had remained in her dressing-room and shut the door, as she could have been rescued from her window.

The Lessons.

Among the lessons of this fire to which those in authority called attention at the time were the following points:—(1) The advisability of always keeping the iron doors closed. (2) The poor resistance offered by the stone staircases—all four fell in. (3) The resistance of good plasterwork on metal lathing. (4) That the great force of men working from hydrants which were brought to bear on the stage enabled the fire on that part of the house to be extinguished almost

immediately; much of the ironwork was left intact. (5) That the principal emergency exits from the auditorium remained in perfect condition.

It should be mentioned here that the Theatre de la Comedie Française was equipped at the time with all the necessary means of escape enforced by the regulations, namely, also with two fire-alarm call-points communicating with the Jean Jacques Rousseau station, a "fireproof" curtain, and a ventilation opening over the stage. The facilities for calling the brigade brought it on the spot in great strength in a remarkably short time, so that the call facilities may be said to have saved the theatre. The curtain did not come into operation, and the photograph on this page shows it still in position over the proscenium opening. Owing to the immediate strength of the fire brigade the fire was mastered in a comparatively short time. Only the stage and auditorium were gutted.

VIEW OF AUDITORIUM AND STAGE DIRECTLY AFTER THE FIRE. (THE FIRE-RESISTING CURTAIN CAN BE SEEN UNUSED.)

UNIVERSAL STANDARDS OF FIRE RESISTANCE.

QUESTIONS are frequently addressed to us as to the exact standards of fire resistance as universally adopted after the great Fire Prevention Congress of 1903, and questions are also frequently asked as to how they were arrived at. We are thus presenting in this article a copy of the actual resolutions of the Congress of 1903, with the standards of fire resistance in respect to floors, partitions and doors. We are also giving, as far as we are able and on the best authority, particulars as to how the standards were arrived at.

The Term "Fireproof."

The Executive of the British Fire Prevention Committee having as far back as 1901 given their careful consideration to the common misuse of the term "fireproof," now indiscriminately and often unsuitably applied to many building materials and systems of building construction in use in Great Britain, came to the conclusion that the avoidance of this term in general business, technical and legislative vocabulary was essential.

The Term "Fire-resisting."

The Executive considered the term "fire-resisting" more applicable for general use, and that it more correctly describes the varying qualities of different materials and systems of construction intended to resist the effect of fire for shorter or longer periods, at high or low temperatures, as the case may be, and they advocated the general adoption of this term in place of "fireproof."

Degrees of "Fire-resistance."

Further, the Executive, fully realizing the great variations in the fire-resisting qualities of materials and systems of construction, considered that the public, the professions concerned, and likewise the authorities controlling building operations, should clearly discriminate between the amount of protection obtainable or, in fact, requisite for different classes of property. For instance, the city warehouse filled with highly inflammable goods of great weight requires very different protection from the tenement house of the suburbs.

"Temporary," "Partial" and "Full" Protection.

The Executive were thus desirous of discriminating between fire-resisting materials and systems of construction affording temporary protection, partial protection and full protection against fire, and proposed to classify all building materials and systems of construction under these three headings. The exact and definite limit of these three classes was based in the first instance on the experience obtained from numerous investigations and tests, combined with the experience obtained from actual fires, and after due consideration of the limitations of building practice and the question of cost. The matter was discussed with the leading foreign authorities with the view of arriving at data acceptable in all countries.

Time Limits.

The Executive's minimum requirements of fire-resistance for building materials or systems of construction were put forward in the form of standard tables for (1) fire-resisting floors and ceilings, (2) fire-resisting partitions, (3) fire-resisting doors; but they could be more popularly summarized as follows by saying—

(a) That temporary protection implies resistance against fire for at least three-quarters of an hour to, say, one hour, according to circumstances.

(b) That partial protection implies resistance against a fierce fire for at least one hour and a half to two hours, according to circumstances.

(c) That full protection implies resistance against a fierce fire for at least two hours and a half to four hours, according to circumstances.

The actual minimum temperatures, thickness, questions of load, and the application of water can be appreciated from the tables by all technically interested, but for the popular discrimination the time standard alone will probably suffice.

The Standards.

The standards as proposed by the British Fire Prevention Committee, and adopted as universal standards at the International Congress, have in fact and practice become the universal standards in this country, on the Continent and in the United States, so that the same standardization may now be said to be common to all countries. In several instances the primary points of the classification have been adopted in legislation or local regulations, and as time goes on this legislative adoption is likely to become general.

The Universal Standards of Fire Resistance, as adopted by the International Fire-Prevention Congress, London, 1903.

The following were the Congress resolutions referring to the subject:—

Re the term "Fireproof."—The Congress

having given their consideration to the constant misuse of the term "fireproof," and its indiscriminate and unsuitable application to many building materials and systems in use, have come to the conclusion that the avoidance of this term in the general business and technical vocabulary is essential.

Re the term "Fire-resisting."—The Congress considers the term "fire-resisting" more applicable for general use, and that it more correctly describes the varying qualities of the different materials and systems of construction intended to resist the effect of fire for shorter or longer periods, at high or low temperatures, as the case may be; and it advocates the general adoption of this term in the place of the term "fireproof."

Re Standards of Fire Resistance.—The Congress confirms the British Fire Prevention Committee's proposed standards of fire-resistance, and hereby resolves that the universal standards of fire resistance shall in future be:—(1) Temporary protection; (2) Partial protection; (3) Full protection; in accordance with the Committee's schedule.

Standard Table for Fire-resisting Floors and Ceilings.

	Class B	240 mins.	1800° F. (982.2° C.)	Optional	25 sq. ft. (2.322 sq. m.)	5 mins.

A BREMEN SUB-FIRE-STATION.

THE new sub-station of the Bremen Fire Brigade is above the average for fire-stations of this description, and we accordingly present some illustrations by the courtesy of the chief officer, Herr Dittman. It will be observed that the sub-station is planned on an open site, and that the engine-house is so arranged as to have the stables at the back, whilst the whole of the officers' and men's rooms are in a wing. The architectural treatment of the building is also above the average for fire-stations, and accords with the local ideas.

FIRE TESTS.

Tests with Various Concrete Aggregates.

AN important series of official fire tests with concrete aggregates is to be undertaken by the British Fire Prevention Committee in co-operation with the Associated Portland Cement Manufacturers, Ltd.

At a period when practically the whole of the technical world is discussing problems relating to concrete and ferro-concrete it is of absolute importance that the true facts as to the fire-resistance of the various aggregates of concrete should be definitely and independently ascertained irrespective of any system for its application as ferro-concrete or otherwise. It is common knowledge among those interested in the subject of fire-resistance that the value of concrete varies materially according to its aggregate in actual fire. The professional man generally and the public still speak of concrete irrespective of the actual aggregate, not even discriminating between clinker concrete and ballast concrete, although the difference between these two aggregates is enormous.

The tests, we understand, will be with the following aggregates of concrete, namely:— (1) Blast furnace slag, (2) broken bricks, (3) broken granite, (4) burnt ballast, (5) coke breeze, (6) furnace clinker and (7) Thames ballast. After these seven tests have been undertaken it is not improbable that further tests will also be undertaken.

Tests with Armoured Concrete.

We understand that among the tests with proprietary systems to be undertaken during the early autumn will be a test with an armoured concrete floor by Messrs. Coignet, of Paris. This will be the first armoured concrete floor under investigation in this country, and having in mind the extraordinary manner in which the question of protecting the metal rods in armoured concrete is generally overlooked by the majority of firms associated with armoured-concrete work, it will be a matter of considerable interest to see the results of the test mentioned.

Fire Tests in August.

During the early part of August the Committee propose testing in rotation the following proprietary systems of construction, namely, an armoured porous terra-cotta floor of roft, span constructed by Messrs. Faber, of Berlin; a roller shutter on the Kinnear system (U.S.A.), erected by Messrs. Arthur L. Gibson & Co., of London; and a zin. terra-cotta partition by the National Fireproofing Co., of U.S.A. There will also be an experimental test by the Committee with a heavy concrete floor supported by broad flange girders, provided by Messrs. H. J. Skelton & Co., of London. It is anticipated that the whole of these tests will be undertaken on one day.

The Testing Station Sub-Committee.

The following are the names of additional members of the testing arrangements sub-committee of the British Fire Prevention Committee:—Lieut.-Colonel Winn, R.E., Mr. A. T. Walmisley, M.I.C.E., Mr. Oswald C. Wylson, F.R.I.B.A., and Mr. Frank Macey, architect.

GROUND-FLOOR PLAN.

A NEW SUB-STATION OF THE BREMEN FIRE BRIGADE.

THE NATIONAL FIRE PROTECTION OF THE UNITED STATES.

THE National Fire Protection Association of the United States held their annual meeting at New York at the end of May, and the proceedings have now been issued. They comprise an octavo volume of over 300 pages.

The Society is primarily the outcome of a wish on the part of the insurance experts to reduce the fire risk in the United States rather than the outcome of a wish on the part of public authorities and professional men to encourage fire prevention, and thus the American membership primarily comprises insurance men. The American Institution of Architects, the American Society of Mechanical Engineers, and the International Association of Fire Engineers, are however officially associated with this organization. Mr. Hexamer of Philadelphia, who visited London in 1903, is the president, and Mr. Merrill, of the Chicago Fire Underwriters Laboratories, is the secretary.

A large number of important questions were discussed by the association at their meeting, such as matters dealing with automatic sprinklers; the protection of tramway car-sheds; the use of cement in building construction; the standards of fire protection in

factories; the use of electrical rotary and steam fire-pumps; the standard thread for fire hose couplings; theatre construction and equipment, and protective coverings for window and door openings.

In most cases the work had been prepared prior to the meeting by sub-committees. The sub-committees brought forward reports for consideration and discussion, and most of these reports had been printed in proof prior to the meeting.

The Berlin Police Prefect has been studying the police and general administrative arrangements of London, including questions relating to fire-prevention, the Building Act and theatre-safety. He visited the London Fire Brigade and the London Salvage Corps. He also inspected a number of theatres under the guidance of the chairman of the British Fire Prevention Committee. He accorded particular attention to the Apollo Theatre, where he was met by Mr. Lewen Sharpe, the architect of the theatre, who is at present also chairman of the fire brigades committee of the London County Council. He also examined the question of flame-proof scenery as demonstrated at the Alhambra Theatre by Mr. Alfred Moul.

THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

August 9, 1905. Vol. 22, No. 548.

6, Great New Street, Fetter Lane, E.C.

Summary.

Mr. E. G. Rivers, M.I.C.E., draws attention to the desirability of the heating engineer being associated with the architect of a new building at the very earliest stage, *i.e.*, when the sketch plans are being prepared. Ventilating and heating arrangements are too often viewed in the same light as the furniture and fittings of a building—in many cases no provisions being made by the architect beyond the inevitable boiler-house and "Tobin tubes" in the larger rooms. Mr. Rivers inclines to the opinion that a computation based upon the 30ft. or minimum scale of air per person per minute is sufficient if the air is of good quality. (Page 80.)

The breaking weight of a timber beam may be found by the equation $BW = \frac{b \times d^2 \times c}{L}$, where BW = central breaking weight in lbs. by experiment, L = length or span in feet, b = breadth of beam in inches and d = depth of beam in inches. (Page 81.)

We think that, however successful the Cheap Cottages Exhibition may be from the promoters' point of view, or in the way of an advertisement for competitors, it must be written down a failure in so far as concerns the solution of the problem of housing the agricultural labourer. (Page 74.)

Heat and the holiday season combined to rob the London timber trade of all animation during July, and nothing beyond hand-to-mouth business can now be expected until the concluding quarter of the year. (Page 85.)

The competition for a new town hall, municipal offices, &c., at Dartmouth is unsatisfactory because there is no assurance that an assessor will be appointed, and the council reserve the right to make plans embodying ideas that may be contained in either or all of the premiated designs. (Page 84.)

The rebuilding of St. Mark's Campanile, Venice, has now reached ground level, and the engineers hope to get several metres up during the autumn. Nearly all the pieces of the Loggetta have been found and can be put together. (Page 84.)

The L.C.C. Bill for the construction of tramways over Blackfriars and Waterloo Bridges and along the Embankment will be reintroduced in the next session of Parliament. (Page 84.)

Drawings prepared in the Architectural Association day school may be submitted in lieu of testimonies of study for the R.I.B.A. intermediate examination, and it is now proposed that students who have completed the four years' course shall be exempted from this examination. (Page 84.)

Week-end Cottages.

IN view of the continual expansion of cities and the increasing desire (of all those who are able) to get away from them after business hours, it seems likely that in the future a very great number of people will make the twofold arrangement of living in town during the working days of the week and spending their week-ends in cottages well outside the city. This, of course, is no new thing, as for long past the practice has been followed by many, but there is no doubt that the tendency of living outside the towns in which people are compelled to work is becoming very much more general, not only by reason of the fact that the air in towns is less beneficial than that outside, but also on account of the time which is wasted in going to and fro. In London especially this is the case, because a very great deal of time is lost in getting in and out of the city—this occupying in the majority of cases quite an hour each way—and as very often the suburban villa has neither the advantages of the house in the country nor of the house centrally situated in the town, we think it probable that a greater number of people will choose to live near their work for the most part of the week and then to go quite away for the week-end. In the event of such a development, the building of moderately cheap cottages would become a very prominent and important matter, and it is in that connection that the present exhibition at Letchworth is suggestive. In the future there is likely to be a newer problem—the housing, not only of the artisans, but of the middle "working" classes.

Foundations.

The majority of foundations with which an architect has to deal are of a simple kind, but now and again he is concerned with work of a difficult nature, and the question then arises as to whether this is not an engineer's province, in which case the architect may not be entitled to commission upon the work. There may be tidal difficulties to be overcome, pumping operations, coffer-dam construction, piling, &c., and it may be desirable to appoint an engineer specially qualified for the work. Of course foundations of this kind entail much expense, and an architect naturally does not wish to lose commission on the outlay. If the work has to be protected against tidal water by sheet piling, coffer-dams or cribs, the question is somewhat simpler, as it becomes nearer the engineer's province; but in other cases, such

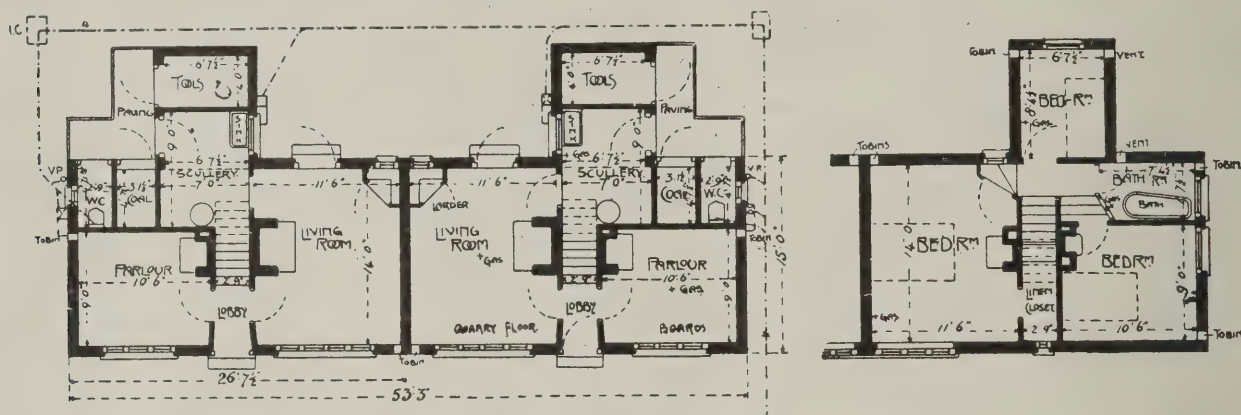

as quicksand or soft semi-liquid soils, requiring the use of pumps, pile-driving and grillages, although an architect is not so qualified as an engineer for the work it is not so far removed from his duties, and often is mixed up with problems of base-ments, which are a distinct part of the work of architectural design. In cases of this kind, where an architect must exercise a general control of the foundations, it seems only right that he should be entitled to claim the commission.

Everyday Practice.

Success in most occupations largely depends on efficient organization, a due relation of one part of the work to the other parts, so that there may be no friction or overlapping. A good deal of the professional architect's work is lacking in this quality. His earlier years are taken up with profitless studies of no practical value to him. His book and class studies bear very indirectly on the practical work he is called upon to undertake; he spends much of his time in drawing and sketching, which are of doubtful value to him and have little relation to the practice of his vocation. But it does not end here. When he begins to practise he finds the same want of relation, the same obstacles to his action in the requirements of clients, local authorities and builders. A great deal of his energy and ability is wasted on preliminary duties of not a very remunerative kind; he has to prepare plans and designs to suit various tastes before one is selected. The architect has the wrong client, or the client the wrong architect, for his particular wants. They do not suit each other. The fact is, as it often happens, the architect does not know his client well enough to design a house for him. Indeed, his position is often very dubious. Among ignorant persons there is a belief that architects are useless—that a builder is enough of an architect for all practical purposes. There was a case heard not very long ago in which an architect was cross-examined by counsel in this way:—"You are a builder, I believe?" "No, an architect." "Builder or architect, architect or builder, it is much the same thing, isn't it?" "No, not at all." "What is the difference?" The architect explained what the difference was, and counsel added: "Oh, very well. That will do. And now, after your very ingenious distinction without a difference, who was the architect of the Tower of Babel?" The architect smiled. "There was not one," he answered, "hence the confusion."

PAIR OF BRICK COTTAGES BY BOURNVILLE VILLAGE TRUST (COST £388) AND COTTAGE BY FIREPROOF PARTITION AND SPANDREL WALL CO. (BRICK-ON-EDGE, ROUGH-CAST, REINFORCED WITH IRONWORK: COST £256).

GROUND- AND FIRST-FLOOR PLANS OF COTTAGES BY BOURNVILLE VILLAGE TRUST.

THE CHEAP COTTAGES EXHIBITION.

(Concluded from last week.)

IN this issue we give the remainder of our photographs, elevations and plans of representative cottages at the Cheap Cottages Exhibition now being held at Letchworth (Garden City). These cottages being of so many different materials, we have not attempted in this article to deal with them under inclusive headings, as in the article in our issue for last week, but have described each separately, adding to the end of the article our opinion on the merits and deficiencies of the exhibition in general.

Brick-on-edge and Iron Reinforcement.

The Fireproof Partition and Spandrel Wall Co., of 92, Tooley Street, S.E., have erected two cottages, one a bungalow, with all the rooms on the ground floor, costing £156 (4½d. per ft. cube), including drainage, &c., and the other a two-floor cottage costing £256 (5½d. per ft. cube), inclusive of drainage and fencing. The latter is illustrated on this page. The parlour (with grate and two cupboards) on the ground floor is 14ft. by 14ft.; kitchen (with range, cupboard and larder), 13ft. by 8ft. 6ins.; scullery (fitted with copper and bath), 8ft. by 6ft.; w.c.; and three bedrooms on the floor above, 15ft. by 11ft., 14ft. 6ins. by 8ft. 6ins., and 6ft. 6ins. by 6ft. 9ins.—all the rooms, on both floors, being 9ft. high. In the roof there is space for two more bedrooms and a store. The walls of these cottages are built of brick-on-edge,

PLANS OF COTTAGE BY FIREPROOF PARTITION AND SPANDREL WALL CO.

reinforced with ironwork and built in cement mortar. They are declared to be as strong as ordinary gin. walls, and self-supporting; foundations are required under the stanchions only. Damp-proofing is assured by the rough-cast outside and the hollow space inside, with additional protection by roofing felt, &c.

Cottages by the Bournville Village Trust.

The Bournville Village Trust have erected a single cottage and a pair of cottages. The former (shown in the photograph on p. 76) contains a living-room, with oven-grate, 14ft. 6ins. by 11ft. 6ins. by 8ft. 3ins.;

parlour, with grate, 9ft. 1½ins. by 10ft. by 8ft. 3ins.; entrance lobby, coal-shed, larder; and bedrooms 11ft. 9ins. by 10ft. by 8ft., 11ft. 6ins. by 8ft. by 8ft., and 6ft. 3ins. by 11ft. 6ins. by 8ft. The cost of this cottage is put at £135 4s., or with bath £138 9s. The pair of cottages is shown in the photograph above. These comprise a living-room, with oven-grate, 14ft. by 11ft. 6ins. by 8ft. 3ins.; parlour, with grate, 10ft. 6ins. by 9ft. by 8ft. 3ins.; scullery, 9ft. by 7ft. by 7ft.; tool-house, 6ft. 7½ins. by 4ft. by 7ft.; coal-house, w.c., &c.; and bedrooms 14ft. by 11ft. 6ins. by 8ft., 10ft. 6ins. by 9ft. by 8ft., and

8ft. 4½ins. by 6ft. 7½ins. by 8ft. with a bathroom on this floor 7ft. 4½ins. by 4ft. 7½ins. by 8ft. The walls are of red bricks, 9ins. outside and 4½ins. inside; the floors are 1in. tongued and grooved boards and 9in. quarries; and the roofs are of Broseley tiles. The footings are of brickwork 18ins. wide, on solid bottom soil. The cost of the pair is put at £369 1s., or £387 19s. with baths; or 4½d. per ft. cube, say £31 per room. The cost of the single cottage is put at £135 4s., or £138 9s. with bath; gas-fittings (including stove) £2 10s. extra. The governing idea has been to give the maximum cubical contents at the least possible expense, compatible with good construction, and the selection of materials based on the Trust's experience in the erection of about 600 houses on the Bournville Estate near Birmingham. The total cost of the installation of the boiler at the rear of the oven-grate, tanks, piping, and bath with taps, &c., complete, is £10 per house. Tobin ventilators are provided in every room. The tool-houses form a valuable addition in the pair of cottages, while the doors opening on to the garden give the cottage-dweller the advantages of a larger property.

Brick and Rough-cast.

The cottage designed by Mr. Percy Houfton, of Chesterfield, for Messrs. Green Brothers, of the same town, contains a living-room with range (extreme measurements 18ft. by 12ft.); scullery with copper, 12ft. 3ins. by 7ft. 6ins.; larder, cupboard-dresser, coal-place, and w.c. opening into outer lobby; and three bedrooms, respectively 18ft. by 10ft. 8ins., 12ft. by 9ft., and 8ft. 9½ins. by 8ft. 8ins. The walls are of 9in. brickwork in mortar, cement rough-cast. The floor of the living-room is of quarries in cement, with granolithic cement for the rest of the ground floor, all being on a 6in. concrete bed. The roof is of local red tiles and the foundations are of brickwork in mortar twice the thickness of the walls. The inclusion of the coal-place, w.c. and open lobby within the rectangle of the ground

BRICK (ROUGH-CAST) COTTAGE
BY GREEN BROTHERS.

BEDROOM PLAN:

PERCY HOUTON, ARCHITECT.
COST £150.

plan provides, it is claimed, more space on the bedroom floor. The cost is put at £150, or about 3½d. per ft. cube, and it is stated that the building can be duplicated for about £175, including profit, architect's fees and men's travelling expenses.

Concrete Cottages.

Messrs. Potter & Co., Ltd., have erected the cottages illustrated on p. 79. The single cottage contains (all on the ground floor) a living-room 14ft. by 12ft.; scullery, 10ft. by 9ft.; three bedrooms, 12ft. by 8ft. 10ins., 10ft. by 8ft. 10ins. and 10ft. by 8ft. 6ins. The walls are of concrete, the outer walls 7ins.

and the division walls 9ins. thick. The floors of the living-room and bedrooms are of wood nailed direct to the concrete, those of the larder, lobby and scullery being of granolithic cement. The roof is of wood, and tiled, with the exception of the scullery, fuel place and w.c., which are of cement and concrete flats. The foundations are of Portland cement. The special features claimed are:—Walls of concrete and rough-cast; no special apparatus used; no wood joists or hollow spaces to ground floor, which is of 5ins. hard clinker and 5ins. Portland-cement concrete; avoidance of wood wherever likely

to decay. The cost is put at £150, exclusive of water-supply, drainage and carriage, or 4½d. per ft. cube.

Messrs. Potter's other exhibit is a pair of semi-detached cottages, each comprising—all on the ground floor—a living-room 14ft. by 12ft., with range; scullery, 10ft. by 9ft., with hob-grate; and three bedrooms, 12ft. by 8ft. 10ins., 10ft. by 8ft. 10ins., and 10ft. by 8ft. 6ins. The walls are of steel framing and plaster on expanded metal, 7ins. overall with a 3in. air-space between the inner and outer skins; the floors, roof and foundations are constructed similarly to the first cottage. The cost is put at £300, exclusive of water-supply, drainage and cartage. The advantages claimed are:—Quickness of construction, fire-resistance and durability.

A Cottage of Asbestos Bricks.

Mr. V. Dunkerley has designed some semi-detached cottages for the Asbestos Brick and Tile Co., Ltd., which each contain on two floors a living-room, with Corne's patent combination range of oven, fire and copper, 12ft. 10ins. by 11ft. 8ins. by 8ft. 6ins.; parlour, with register grate, 13ft. 6ins. by 11ft. by 8ft. 6ins.; scullery, with gas-stove or self-setting range, copper, and bath with hot- and cold-water supply, 11ft. by 7ft. 9ins. by 8ft. 6ins.; larder, coals, &c.; bedrooms, 12ft. 10ins. by 11ft. 8ins. by 8ft. 9ins., 11ft. by 9ft. 4ins. by 8ft. 9ins., 9ft. by 8ft. 1ins. by 8ft. 9ins.; and box-room. The external walls are of asbestos bricks, 9ins. thick, all internal partitions, excepting at fireplaces, being of "Mack" patent partition slabs. The ground floor is of 1½in. wood-block flooring laid on bitumen or concrete, and the first floors are of tongued and grooved boards. The roof is tiled, and the foundations concrete. The

BRICK COTTAGE BY BOURNVILLE VILLAGE TRUST (COST £138) AND TIMBER COTTAGE BY LIONEL F. CRANE (£150).

elevations have been designed to show the adaptability and suitability of the asbestic brick, which is machine-made and composed of lime, sand and asbestos. This brick is well moulded and can be obtained in a variety of colours. The cost is put at £400, including builder's profit, &c., or 4½d. per ft. cube.

A Cottage of Timber and Damp-proof Sheeting.

The Wire-weave Roofing Co., of 108, Queen Victoria Street, E.C., have erected a labourer's cottage which comprises (all on the ground floor) a living-room 21ft. by 14ft. 6ins. by 8ft. 6ins., with dresser, cupboard and range; scullery 17ft. by 9ft., with copper and sink having hot- and cold-water supply; larder; back porch 10ft. by 7ft., with coal-house and earth-closet; and four water-butts. Of the three bedrooms, one measures 13ft. by 12ft., with cupboard, and the other two, with fireplaces, each 13ft. by 10ft. 6ins. The walls are of overlapping vertical boards, 1½ins. by 8ins.,

GROUND-PLAN.

BEDROOM-PLAN.

PLANS OF COTTAGE BY LIONEL F. CRANE.

interlined with "Ferol" sheeting and lined with matchboard covered with canvas and Hall's distemper. The floors consist of in. tongued and grooved pitch-pine boards carried on joists on brick sleeper walls, the roof being also of in. boards covered with

thick "Ferol" sheeting. This is claimed to be an essentially country cottage. The walls of the living-room and bedrooms have four separate thicknesses of non-conducting material, besides a 4in. air-space, to resist heat and cold. The cost is put at £150.

TIMBER COTTAGE BY WIRE-WOVE ROOFING COMPANY. COST £150.

Under the usual by-laws only the chimney of this cottage would be permitted, but the whole building might be erected under the 1903 Model By-Laws recommended by the Local Government Board.

Weather-boarding.

The cottage by Mr. Lionel F. Crane, of London, W., built by Mr. Frank Newton, of Hitchin, is illustrated on the opposite page. It contains on the ground floor a living-room 14ft. 6ins. by 12ft., with range; scullery, with bath, sink and copper, 8ft. 6ins. by 9ft. 3ins.; larder, cupboards, w.c., and fuel-shed; and on the floor above two bedrooms 10ft. 9ins. by 9ft. 6ins. and one bedroom 14ft. by 9ft. 3ins. The cottage is timber-framed, the studding being 6ins. by 2½ins. and the corner-posts 6ins. square. The weather-boarding is treated outside with Carbolineum Avenarius to prevent rotting. The floor of the living-room is of wood blocks on concrete, and those above of ordinary boards. The roof is of old local tiles on boarding and battens, and the foundations are of lime and cement concrete. The cost is put at £150, or 6d. per ft. cube. The furniture of this cottage is by Messrs. Heal & Son, of Tottenham Court Road, W.C., who have also furnished the cottage designed by Messrs. Smith & Brewer. The living-room furniture is of oak and the bedroom furniture of pine painted dark green with the hand-holes to drawers, &c., picked out in bright red.

Mr. Oswald P. Milne, of 77, Chancery Lane, E.C., has endeavoured to produce a cottage that will be light, cheerful and comfortable to live in, as well as up-to-date in its arrangements. It is built on two floors and contains:—Living-room, with range, 15ft. 6ins. by 11ft. 4ins. by 7ft. 9ins.; scullery, with bath and copper, 9ft. 4ins. by 7ft. 6ins. by 7ft. 9ins.; bedrooms, 9ft. by 13ft. 4ins. by 9ft., 6ft. 2ins. by 13ft. 4ins. by 9ft., 12ft. by 8ft. 6ins. by 9ft.; pantry, two cupboards, coal and wood sheds, w.c., &c. The walls are of 9in. brickwork for 18ins. up from the ground level; above, 4in. studding covered on the outside with plaster to a height of 8ft.; weather-boarded and plastered on the inside. Floors of scullery and pantry tiled;

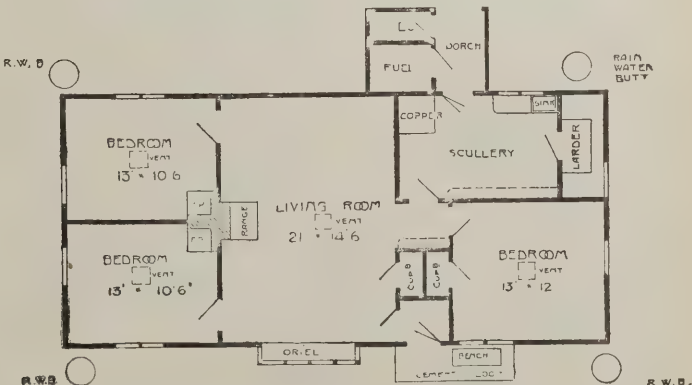

COTTAGE BY OSWALD P. MILNE. BRICK ROUGH-CAST AND WEATHER-BOARDING COST £149.

LIVING-ROOM IN COTTAGE BY LIONEL CRANE: FURNITURE BY HEAL AND SON.

PLANS OF COTTAGE BY OSWALD P. MILNE.

PLAN OF COTTAGE BY WIRE-WOVE ROOFING COMPANY.

the rest boarded. The foundations are of concrete 15ins. deep under the walls and 6ins. thick over the whole site. The roof is covered with red tiles. The prime cost is put at £133 without bath and hot-water supply, and £149 with this.

Co-operative Cottages.

The Co-operative Tenants' Housing Council, Ltd. (Garden City tenants) have erected the pair of cottages illustrated below. The cost of these is put at £300, or 4d. per ft. cube. On the ground floor there is a living-room 16ft. by 13ft. 6ins. by 8ft., fitted with range; scullery, 11ft. 6ins. by 8ft. 6ins. by 7ft. 9ins., with bath, copper and sink; tool-cupboard, pantry, coal-house and w.c.; and bedrooms 5ft. by 10ft. 6ins., 12ft. 6ins. by 9ft., and 12ft. 6ins. by 8ft.—each 8ft. high. The walls are of gin. brickwork, rough-cast, the roof is tiled, and the ground floor concreted. The foundations are of gin. Portland cement concrete, with blue bricks,

vitri-fied, under asphalt damp-course. The front faces south-west. It will be seen from the block plan that it is intended to erect a group of these cottages around a green.

Messrs. Henman & Cooper's Cottages.

Mr. William Henman, F.R.I.B.A., and Mr. Thomas Cooper, F.R.I.B.A., of Birmingham, have designed the single cottage and pair of cottages illustrated on p. 79. These contain (all on the ground floor) a living-room 14ft. by 11ft. 9ins. by 9ft., with a bay window, range fireplace, sink recess, fuel-place and w.c.; and three bedrooms, each 7ft. by 7ft. by 9ft. The walls are one brick thick, the floors being boarded in the living-room and the bedrooms, and tiled elsewhere. The roof is tiled and the foundations are of brick. The cost is put at £100 per cottage, the object of the architects being to provide healthy, self-contained, economical dwellings for the working poor, at a low rent.

Conclusions.

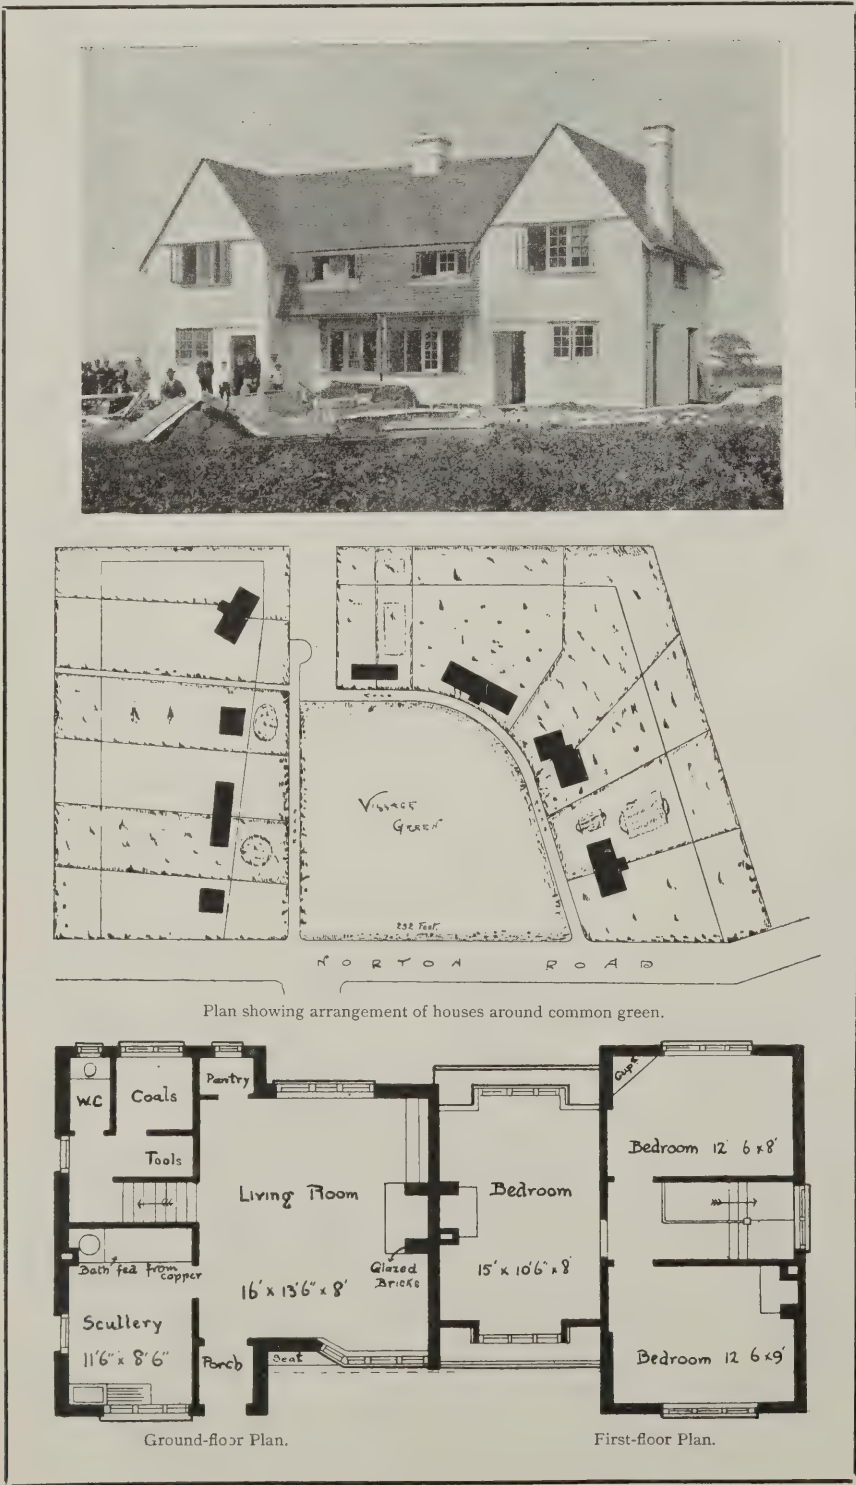

Having now reviewed in detail a representative collection of the cottages, we may give our opinion on the exhibition as a whole. We think that, however successful it may be from the promoters' point of view or in the way of an advertisement for competitors, it must be written down a failure in so far as concerns the solution of the problem of housing the agricultural labourer. It is plain from Mr. J. St. Loe Strachey's first article in the "County Gentleman" suggesting the competition that the type of cottage was intended to be suitable for the agricultural labourer and to cost £150 inclusive. Mr. Strachey calculated that agricultural labourers' wages averaged from 14s. to 16s. per week (12s. is often the case), and therefore £150 was the largest sum that could profitably be spent on the erection of a cottage. We said at the time that 1s. 6d. per week was about all the agricultural labourer could afford to pay. Consequently, to solve the problem a house should be built for £100. The only cottages in the exhibition which approach Mr. Strachey's ideal are those by Mr. Clough, but as this gentleman had already built similar cottages it did not require the exhibition to prove the fact.

A number of the competitors seem to have gone deliberately to work to build cottages which they knew must exceed the limit imposed, simply using the exhibition as a stalking-horse for their own self-advertisement; and from our knowledge of the cost of materials and labour we must think their figures in the catalogue are gross misrepresentations. The conditions of the competition were badly drawn up from the start, because if the cost of the cartage of materials to the site, and fencing, drainage, builder's profit, architect's fees, &c., were not to be included, the sum for which the cottages were to be built should have been very much less than £150, which is the figure at which a cottage such as that desired should be sold.

As regards the planning of the cottages, in the majority of cases this is very bad, the position of the bedstead not having been considered, passages, large landings and nooks sacrificing valuable space; while roofs are often broken up and fittings too elaborate. The designers who prate about art have mostly proved themselves incompetent and impracticable planners, and ignorant of the principles of good construction and hygiene. At the same time there are a number of plans which are fairly good and could be economically built.

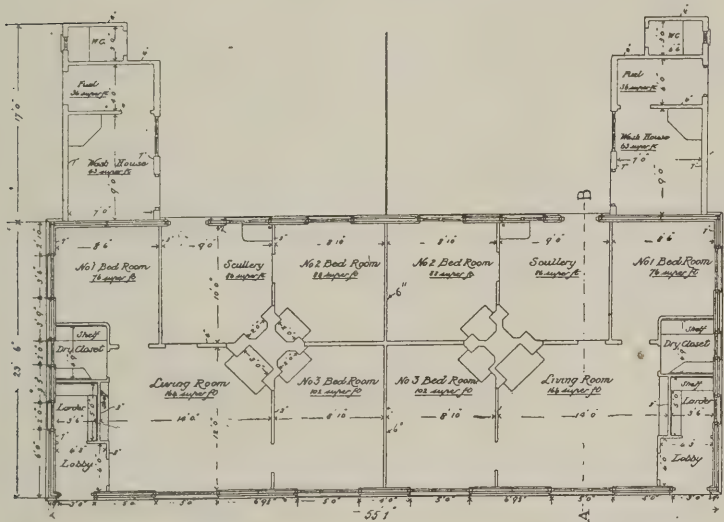

A great deal of nonsense has been said about some of the new materials and methods of construction adopted at this exhibition. In many cases the new materials are more expensive than ordinary brick and plaster, and will remain efficient for but a few years. Concrete has not been utilized in such a way as to make the most of the material, and instead of being cheaper than brick it is as dear, if not dearer, while it is not so satisfactory by reason of the condensation of moisture if not plastered inside.

The exhibition of designs which is also being held adds nothing useful, the plans being duplicated in one or other of the cottages. In conclusion we may say that there are plans in this exhibition which could be erected for the money by means of piece-work labour and economy in fittings. As we have said before, direct employment of labour and the purchase of materials is the crux of the problem. Many of the buildings are still unfinished. The wrong class of people also seem to be visiting the exhibition. They appear to be mostly parsons, week-enders and "simple livers," who go down in shoals seeking the impossible; and we cannot but feel that those competitors who threw discretion to the winds and built prettily and lavishly knew their public best.

VENTILATING AND HEATING.

By E. G. RIVERS, M.I.C.E.,
Chief Engineer to H.M. Office of Works.

IN a paper on ventilation and heating which he read before the recent London congress of the Royal Institute of Public Health Mr. E. G. Rivers, M.I.C.E., said that the ventilating and heating of places of a domestic type, where the maximum occupation was not excessive, and where open fires were a *sine qua non*, presented no special difficulty in the winter season, while in summer open windows probably afforded the best solution; but with places in which a large number of persons were congregated a very different problem presented itself—one which called primarily for the attention of the engineer, who should be associated with the architect of a new building at the very earliest stage—i.e., when sketch plans were being prepared.

Ventilating and heating arrangements were too often viewed in the same light as the furniture and fittings of a building—in many cases no provisions were made by the architect beyond the inevitable boiler-house and "Tobin tubes" in the larger rooms.

Air Supply.

The supply of air per person per minute was placed by some authorities at 30 cub. ft., while others asserted that as much as 50 cub. ft. was required. Personally he inclined to the opinion that a computation based upon the 30ft. or minimum scale would suffice very well if the air were of good quality.

Absurdities about "Natural" Ventilation.

Now, as to the means by which this change was to be effected. He had often wondered at the credulity of users of certain appliances for the alleged securing of the required change of air in a building on the principle of so-called "natural ventilation." Without much thought, such appliances were piled into building contracts and were expected to do great things in the change direction, but in a good many cases no provision was made for the admission of air to replace that alleged to have been removed. Given a certain wind velocity and means of admitting fresh air, there would probably be an upcast to a certain extent in such appliances, but something totally ineffective for dealing with the change incidental to a considerable occupation. Under winter conditions, with still outer air, there was no upcast, but, on the contrary, a descent of the colder and heavier air into the building.

Mechanical Means only Effective.

The concentration of persons in an enclosed space demanded, therefore, a concentrated supply of air, large in volume but low in velocity, and this could not possibly be effected save by mechanical means. The earliest known application of "fan" circulation of air was seen in the old "skip" beehive, which, but for the never-ceasing whirring of the bees' wings, would probably be a difficult place even for insect-life. In the ventilation of buildings very satisfactory results could be obtained by using fans of suitable type, properly applied, either dealing with the input or the extraction—preferably a combination of both.

Mr. Rivers next considered the cleansing and humidifying of the incoming air, "cleansing" being understood to mean the removal of free carbon and other mechanical impurities chiefly.

Position of Intake.

In all properly-designed systems there must be a main air-intake for winter work, and the best position for this was near the ground-level—just sufficiently protected by a low wall from the entry of heavy impurities. From this point the incoming air should be taken into the screen chamber, steam coils being placed between the point of air entry

and the screen to guard against the freezing of the washing water in winter-time. The input fan should be placed some distance away from the screen, through which the emulsion of air and water was first drawn, and then propelled into the main airways for heating and distribution.

The Washing-screen,

being a very important factor in the case, required special consideration. Mr. Rivers mentioned that, in connection with the proceedings of the last Select Committee appointed to enquire into certain matters affecting the ventilation of the House of Commons, he carefully considered the efficiency of the few types of washing-screens then in use, and arrived at the conclusion that no type was wholly satisfactory. It appeared to him that the points in connection with a washing-screen might be classified as follows:—

(1) The materials of construction should not be decaying.

(2) The impurities removed from the air should not be retained upon the screen.

(3) The interstices should not allow of the passing of untreated air.

(4) The consumption of water should not be excessive.

In this connection he described the type of washing-screen which he recommended to the Select Committee on the ventilation of the House of Commons, and which had been adopted with very satisfactory results.

The whole area of the screen was constructed of copper-wire gauze of a mesh of 400 to the square inch. This was fixed in the form of removable panels to iron frames, the whole being vertically rigid. The water application occurred on the inlet side of the screen in the form of impingement jets without any moving parts; the resulting spray covered the whole area, and the combined air and water was drawn through the screen by the "gauge" exerted by the fan. The large number of mesh divisions to the square inch held "water lenses" or films, which were being continually formed and broken by the passing air and water. Although a certain percentage of water passed through the screen, there still remained sufficient to wash off any particles which might be caught by impingement upon the wire gauze. The quantity of water used was not large, and none was wasted—it passed into a small tank, from which it was automatically pumped to the steam boilers.

Warming and Distribution.

The next point which called for attention was the warming and distribution of the incoming air. Here one approached the controversial, there being strenuous advocates of a centralized heating battery for the whole building, from which warm air was sent by the fan to the distributing flues, while others preferred to divide the heating units and to place them close to the points of delivery to the rooms. The alleged advantage of

The Initial Heating Battery System

did not appeal to him, for the following reasons:—It was necessary under this system to have either a battery with a very high temperature upon the elements, which were often inaccessible for proper cleaning or repairs, or else one of very large superficial area. If the former were adopted, the air was likely to be devitalized from overheating, but in this sense the latter was not so objectionable, though a serious loss of thermal units occurred in both cases in the main and distributing flues. (In all systems of flue-distribution, whether of hot or cold air, it was necessary that the flues be constructed of glazed brick and with ready access for cleaning.)

The question of the velocity of the air passing over the battery was one of vital importance. This was a rock upon which many people came to grief, and the height of absurdity seemed to be reached when we

heard of such things as "high-velocity plenum." In such a system the high temperature of the steam units in the battery was speedily lowered on the side of the elements facing the incoming air, and the whole approached the condition of an air condenser. The passing air was not allowed sufficient time of contact to pick up the thermal units, and the arrangement was therefore inefficient and wasteful.

The question of velocities was one to which engineers should devote more attention, and they should keep in mind the intimate relations of cause and effect as applied to these principles. It would be found that the effective collecting of thermal units from a heating surface demanded a low velocity comprised within a very limited range, and he ventured to think that this reason alone went a good way towards the condemnation of the initial heating battery system.

As the result of many years' experience and study of the subject, he inclined to the opinion that

The most Economical and Efficient Arrangement

should include the following points:—With the air-intake and washing-screen arranged as before described, the input fan would send fresh air into horizontal airways of sufficient size—say, in the basement of a building—and from these controllable distributing flues would be taken up in the main walls to radiator positions in the rooms to be warmed. In this arrangement the main airways received the maximum velocity of the fan discharge—this being subsequently lowered in the distributing flues. The ventilating radiators would take their inlet-air from these flues, imparting the thermal units at a low velocity. To counteract the chill arising from glass surfaces exposed to the outer air, radiator positions should preferably occur under windows, and under this arrangement warmed fresh air would enter at a low level.

They had next to consider

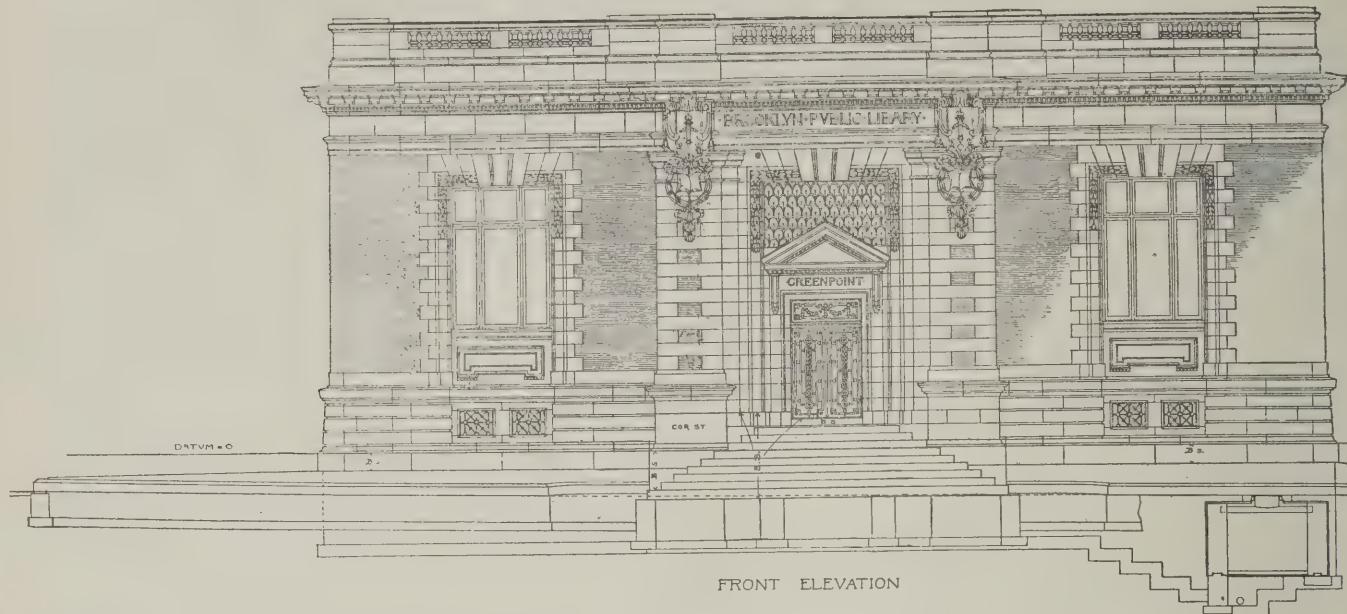

The Direction of the Supply

in order to ensure an efficient change of air in a room. Taking open-air conditions as a guide, it would be found that air-currents took a horizontal direction, coupled with a tendency to rise slightly from contact with the warm earth in the summer season—of course, at low velocities. When velocities were high the tendency to rise practically disappeared. Fresh air being admitted low down on one side of a room, the direction of the flow should be across the room, and the extraction apertures should be at two levels—one at the same height as the point of entry and one at the ceiling-line—both communicating with the same extraction flue.

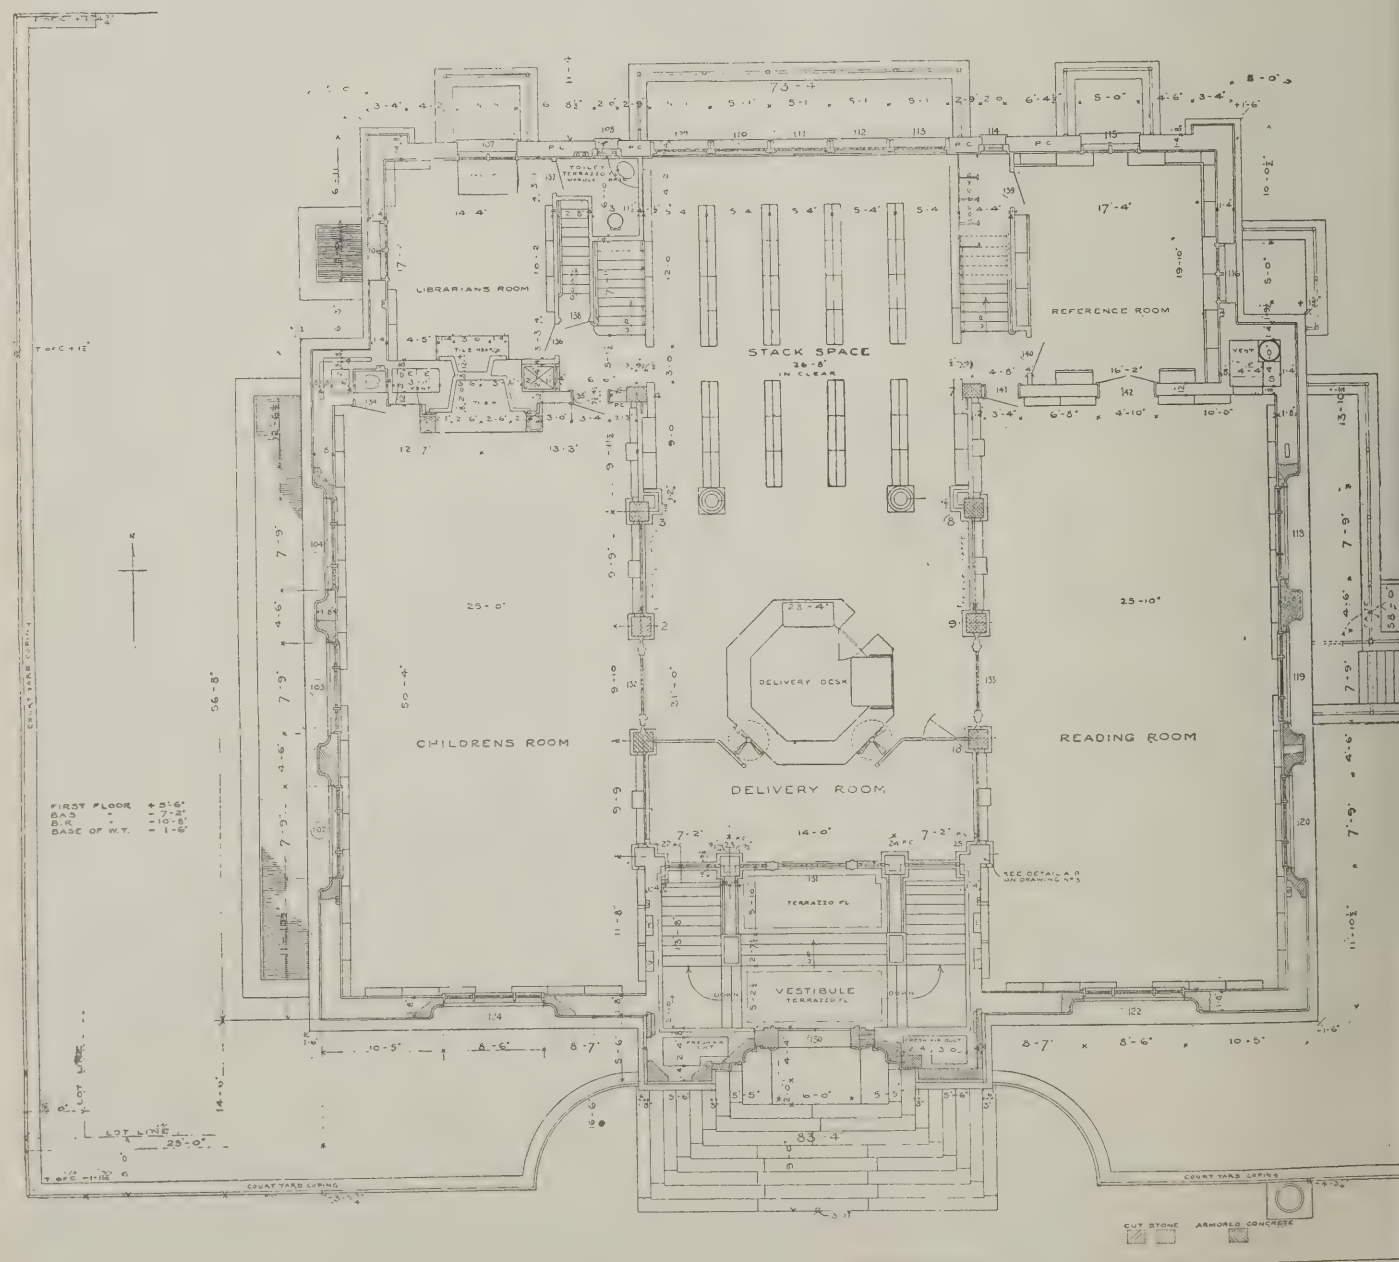

Downward Plenum System.

Hitherto he had dealt with the horizontal system of air-change, which he considered to be the best suited to the majority of cases, when such a system could be applied, but for theatres and other similar places of public assembly there was no valid objection to the downward plenum system, coupled with ultimate upward extraction *via* flues in the main walls. In this case the ultimate outlet for the vitiated air needed to be carried well above and away from the inlet, unless the latter were first taken from below. The ancient idea that extraction must necessarily be upward, because heated air rose, was to be dismissed from their minds. What we had to keep in view in the case of a theatre was the periodic change of the air without draught to the audience and irrespective of direction. The air admission in the downward plenum system should be over as large an area as possible and at a low velocity; therefore in the construction of a new building this could be best effected by the interposition of a separate roof-space as an equalizing chamber. The inconvenience and danger of "streak" ventilation by the injudicious use of fans also needed to be taken into account.

TESTS ON TIMBER SCANTLINGS.

THE accompanying diagram showing the results of some timber tests carried out in the engineering department at Bradford Technical College has been redrawn from one given by Mr. John W. Overend in a recent number of the Journal of the Incorporated British Institute of Certified Carpenters. The tests, it will be seen, were carried out on scantlings of Oregon pine (from British Columbia), English oak (from Yorkshire), American pitch-pine (from Florida), teak (from British Burma), and greenheart (from British Guiana). The scantlings were 12ins. deep by 9ins. wide over a span of 7ft. with vertical supports. The results of the tests may be tabulated as follows:—

	Breaking Weight in Centre.	Constant or Modulus of Rupture for Beam 1in. wide, 1in. deep and 1ft. long.	
		By Experiment.	As given by Sir J. Anderson.
Oregon pine	20'27	245	—
Oak	27'42	331	557
Pitch-pine	27'82	336	544
Teak	35'58	430	820
Greenheart	52'17	626	—

The constant or modulus of rupture by cross-breaking is calculated by the formula $c = \frac{BW \times L}{b \times d^2}$, where BW = central breaking weight in lbs. by experiment, L = length or span in feet, b = breadth of beam in inches, and d = depth of beam in inches. The breaking weight of any other beam may then be found by the equation, $BW = \frac{b \times d^2 \times c}{L}$.

Birmingham Town Hall is in process of alteration. The work, which was begun in May, has involved the reconstruction of the orchestra, the improvement of the existing exits and the provision of others, as well as the provision of proper sanitary arrangements. Mr. F. Martin (of the firm of Martin & Martin) prepared the plans. The cost is estimated at £6,000.

Correspondence.

A Recreation Club for Architectural Students.

To the Editor of THE BUILDERS' JOURNAL.
SIR,—I think Mr. Gordon's idea for a recreation club should not be shelved without a good try to set it going. There are many students already playing tennis, football, &c., for different clubs, but a great number do not play because they cannot find a suitable club. I trust you will take this matter up.—Yours truly,

J. ARCHIBALD WILSON.

BAYSWATER.

[It is quite outside our province to start any such club as that suggested, but, as already stated, we shall be happy to lend space in bringing students together so that the actual arrangements can be carried out by them.—Ed. B. J.]

Plougasnou Church and its Cresset Stone.

To the Editor of THE BUILDERS' JOURNAL.
SIR,—Happening quite recently to have been at Plougasnou, "C. A. N.'s" excellently illustrated paper on its church, in your issue for July 19th, has been perused by me with exceptional interest. Therein the author refers to "an altar-like slab of stone, with a square sinking in the middle . . . apparently designed for a 'cresset stone,' or else for some kind of credence for offerings." One so seldom comes across any reference to cresset stones that this passing mention is of value, and I blame myself for carelessness in not noticing the stone in question when actually upon the spot. "C. A. N.'s" remark, "designed for a cresset stone," does not leave it quite clear whether he means it is a cresset stone or a receptacle for a cresset stone to fit into. Of course, all cresset stones I have ever examined—and they are many—contain one or more circular cup-like cavities upon the upper face. The word "cresset" is the Middle English word for a cup containing a light, and comes to us from the old French *cresset*, a cresset, as well as from the old Dutch *kruyse*, a cup or pot.

We have many instances of cresset stones in England—that at Lewanwick Church,

in north-east Cornwall (much like a font and containing seven cup-like sinkings) being, perhaps, the best. Other interesting examples may be seen at Calder and Furness abbeys, Carlisle Cathedral, Wool Church (Dorset), St. Mary's Monmouth, St. Mary's Abbey York, Durham Cathedral, Llanthony Abbey (Wales), &c. I have also seen four ancient specimens in the Stockholm Museum, and yet another at Strio, in the diocese of Sund. At the latter place there is also preserved one which was formerly in Nöbbelop Church, in the same country. In Sweden these are known as *vigvattens-sten* (holy-water vessels), but they are, without a doubt, really cresset stones.

If "C. A. N." is correctly read—that the cavity at Plougasnou is square on plan—then I doubt whether it is a cresset stone at all, as the cups in the latter are invariably round.

The actual use of cressets is very clearly explained in the "Rites of the Church and Monastery of Durham": "There is standing in the south pillar of the Quire doore of the Lanthorne, in a corner of the same pillar, a foure-squared stonn, which hath been finely wrought in every square, a large fine image, whereon did stand a foure-squared stonn above that, which had twelve cressets wrought in that stonn, which was filled with tallow, and every night one of them was lighted, when the day was gone, and did burne to give light to the monkes at midnight when they came to mattens." And again those in the dormitory are described: "In either end of the same dortor was a four square stone, wherein was a dozen cressetts wrought in either stone, being ever filled and supplied by the cooke as they needed to give light to the monkes and novices, when they rose to their mattens at midnight, and for their other necessary uses."—Yours truly,

EXETER.

HARRY HEMS.

A Suggested Street Improvement.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The articles in your Journal on the suggested improvement of Oxford Street near the Marble Arch have much interested me. For long I have wondered why an improve-

ment of this corner and of Park Lane has never been mooted. My own idea is of a highway in continuation of Edgware Road, along Park Lane, across Buckingham Palace grounds into Vauxhall Bridge Road, over the bridge and to Camberwell Road near the Oval. Such a road would be of the greatest possible utility in facilitating the inter-communication between south and north-west London, now so sorely needed. The congested Marble Arch intersection would be relieved, the valuable residences of Tyburnia opened up to most convenient access from clubland, while the Arch itself would stand out as a feature of the scheme much as suggested by Mr. Speight. Unluckily the scheme falls foul of the Buckingham Palace grounds, but perhaps some readjustment of areas might be found which would put the scheme within the limits of practicability. At the worst, the road might go across Green Park along the front of the Palace and thence direct to Vauxhall Bridge.—Yours truly, F.S.I., A.M.I.C.E.

Expansion of Concrete Floors.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The question about concrete floors asked by "C. W." on p. 24 of your issue for July 12th opens out a subject of general interest, and the answer given does not, I think, cover the whole interrogation.

Did the querist put the sample of concrete into the bottle at the same time as the concrete floor was laid, or did he only apply the bottle test after the floors had expanded, and was the sand test made at the same time or otherwise?

My own experience is somewhat large. At one time, by seeing to fine grinding and efficient aëration of the Portland cement, I had prevented the coke-breeze concrete expanding. Now we find that expansion is not prevented, but deferred to three to eighteen months after the floor concrete is in position. This alteration of behaviour coincides with the alteration in the manufacture of the cement, by which 2 per cent. of gypsum (sulphate of lime or plaster) has been added either before burning or at time of grinding—I do not know which. Users so constantly demanded a slow-setting cement that this gypsum is now successfully added to give it that quality without the trouble and expense of finer grinding and aëration. Now, the expansion takes place at a time much more convenient to builder and cement manufacturer, viz., when both have been paid.

I have raised the question several times in the professional press and at meetings of societies where papers on cement have been read, but have not succeeded in ascertaining whether the co-incident alteration in the cement manufacture and the deferred expansion of the concrete are respectively cause and effect. The question appears to be persistently shirked.

Is the delayed expansion caused by the chemical reactions between the other ingredients of the cement or matrix? Would the gypsum (sulphate of lime) react on the sulphur in the coke to the detriment of the concrete? We architects cannot be expected to be expert chemists in determining these abstruse questions; we can only observe and report as alterations in manufacture occur, and occur without any consultation with architects and engineers, as users.

The gentleman who answered the question says it is usual to leave a space around the walls until all expansion has stopped. But I remember reading in your columns a discussion of the members of a builders' institute in which highly experienced builders of great reputation deprecated this expedient, and in any case it is highly inconvenient where the expansion, as is now the case, is deferred for so long a time after the work is done.

It must also be remembered that in the

case of long concrete floors with transverse steel joists the precaution last referred to is quite useless in endway expansion, as no space can be left between joist and concrete, and the joist ends at their bearings communicate the expansion force to the walls.

The suggestion that the concrete was over-limed appears to be futile in view of the querist's information that although the furnace ash concrete in his experiment burst the bottle, yet the same cement mixed with Leighton Buzzard sand had no such effect. If over-liming was the efficient cause of the expansion one would expect it to have survived so as to have expanded both samples.—Yours truly, A. H.

LONDON.

"A. H.'s" letter is interesting, and perhaps other correspondents can throw a light on the subject. In the particular case at issue there is very little to discuss which is tangible. There are so many possibilities that it would require much experimenting and careful observation to discover the real causes of the effect. Expansion of concrete is usually due to over-liming, and our reply was in general terms. In the second experiment our correspondent made with the sand the cement might have been more aërated, and thus free lime might have been neutralized, but as the bottle was filled at the same time as the one with furnace ashes aggregate, this does not appear to have been the case. Another point touched on in our reply was whether the floors were allowed to set in air or kept wet. It seems very probable that the mischief was caused by the iron clinkers and sulphur deleteriously acting on the cement, as often happens with iron slag. As regards "A. H.'s" contention that gypsum may cause expansion, we think this doubtful. For one thing the proportion is small. Whatever chemical action was going to take place could hardly occupy months in developing when both materials are finely ground and have water present to assist combination. "A. H.," in referring to a discussion reported in this Journal, probably means that at the Royal Institute of British Architects, when papers on reinforced concrete were read by Mr. Mouchel and Mr. Dunn, but then the speakers took special precautions with the cement and the concrete to avoid trouble, as it was not possible to adopt the usual expedient. With regard to an ordinary steel joist floor, the distance between the joists is so small that the expansion is little and can be taken up by the joists; but there is a greater extent of concrete parallel to the joists, and it is wise to leave a space around the walls that way.—ED. B. J.]

Cheap Cottages Exhibition.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Referring to the article on the Cheap Cottages Exhibition in your issue for last week, I notice that you say the cost of the pair of cottages I have built at Norton is "put" at £400. It may interest you to know that these cottages were not built with a view to competition. The work was a commission and £400 was the contract sum, and as such includes all the usual things—builder's profit, carriage, &c., complete—also a barn building 14ft. by 10ft. inside which you do not mention. Nor was the price competitive, as I was so pleased with the contractor's work on another job that I asked him to give me a price for this without competition. You will thus see that, deducting the items allowed by the committee, the price per cottage would be well under £200—something like £170 to £180 or less. The same remarks apply to the cottages I built for the First Garden City, Ltd. The prices in the exhibition catalogue are from the accounts as settled, and include builder's profits, carriage, &c. I do not think there is any scamped work in these cottages, and it is only fair to state that the builders for

both commissions were Messrs. Raban & Sons, of Baldock, Herts. The cottages were only entered because they were found eligible for competition.—Yours truly,

LONDON.

GEOFFRY LUCAS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—It was certainly desirable that the public's attention should be called to the discrepancy between the real and stated cost of the cottages at Letchworth. But you have let go the chief offenders and tarred all parties with the same brush. For instance, there is nothing to complain about in the stated prices of Mr. Geoffry Lucas's cottages or of Mr. Troup's, both admirable and probably erected for just about the sums named; but compare Mr. Lucas's with Mr. Baillie Scott's. The difference in (stated) cost is only £20. Yet in Mr. Baillie Scott's, unless I am mistaken, there are nearly half as many more cubic feet, the materials are of the most expensive kind—old tiles, lead-lights filled with crown glass, elm doors with purpose-made wrought iron-work, elm dressers and seats, half-timber work, rough-cast, and not the slightest attempt in any direction at economy. Note the large amount of brickwork in proportion to space enclosed, the huge proportion of roof—scullery, coals, &c., being only one storey high; the work in dormers, lead flashing, &c., and a large part of the chimney projecting from the roof—this chimney has fourteen angles, all rough-cast. Note also the expensive paving to porch and front entrance. It really is an insult to the credulity of the profession to state that these cottages only cost £420: £700 or £1,000 is a great deal nearer the mark. I work out the Concrete Machinery Co.'s cottage at 3d. per ft. cube. It would be interesting to know how this saving is effected. I suggest that they should submit a bill of priced quantities for publication.—Yours truly,

X.

OUR PLATES.

FOLLOWING our practice of giving from time to time representative examples of modern work abroad, we illustrate this week another American library—the Greenpoint branch of the Brooklyn Public Library. American architects have excelled in the monumental treatment of their libraries, having been taught this by the French, and the present example is a very good one. The exterior and interior are well-proportioned and the plan is symmetrical and open. It will be noticed what a large room (50ft. by 25ft.) is provided for children, this feature being especially prominent in American libraries and one which has found its way over here. The arrangement of the book stacks and delivery desk is also interesting in comparison with English practice.

Builders' Notes.

Messrs. Joseph Kaye & Sons, Ltd., of Leeds and London, have received an order from the Admiralty for 4,700 of their new patent serrated seamless oil-feeders.

The Aberdeen Quarries are feeling the depression in the local building industry. At one quarry there is stated to be already an accumulation of stone for which there is no demand. Several of the quarries are devoted largely to the production of stone for manufacture into setts. There are one or two big building jobs yet to be finished in Aberdeen, and for some time this will keep up the demand at the quarries which have the orders in hand, but when these are completed it does not appear that the outlook will be at all bright.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Seating of a Public Building.

HERNE HILL.—V. H. H. writes: "Please state the London County Council regulations as to the number of chairs allowed to be fixed together in a public building and the distance apart each way."

The regulations of the London County Council as to gangways in public buildings state that "a clear passage . . . not less than 2 ft. wide shall be formed at the sides and in the rear of the seating in every part of such premises. Such passages or gangways shall at all times be kept entirely free from chairs, flap seats or other obstructions, whether permanent or temporary." I am not aware of any regulation as to the points on which you particularly ask for information. It is, however, usual to allow 2 ft. 6 ins. from back to back of the seats and about 1 ft. 8 ins. in length for each person. An ordinary chair occupies a width of about 1 ft. 4 ins.

F. S. I.

Building in China.

ROTHESAY.—ROTHESAY writes: "Having been asked to prepare plans of a house to be erected in China, I should be glad to know whether there are any books published giving information about the methods of building in that country, and if plans should be drawn to British or metric scales."

We do not know of any book giving information as to the building laws or methods of building in China. Possibly the Embassy might be able to inform you.

Cotton Spinning Mills.

SUBSCRIBER writes: "Please name one or two books on the construction of large cotton spinning mills similar to those erected in the manufacturing districts outside Manchester."

We are not aware of any book dealing with the construction of large cotton spinning mills. There are books on the construction of the machinery, such as Nasmyth's "Modern Cotton Spinning Machinery" (Manchester, 1890), but apparently nothing on the arrangement and construction of the mills.

Cracks in Factory Walls.

FACTORY writes: "The new building shown by sketch (not reproduced) is used for the manufacture of mastic compositions. About three months ago an explosion occurred, disturbing the brickwork of the boiler-house and starting the skewbacks of the arches at the end of the building. This damage was repaired. About one month ago cracks appeared above the window arches, mostly following the jointing of the brickwork; the rings of the arch over the door parted and are very gradually lengthening. I do not think this is due to settlement, as the foundation is good firm clay, but I have been told that the heat from the pitch boilers caused the work to expand, and not being able to contract again it cracked; this being probably assisted by the chemical action of the fumes of sulphur. What is your opinion?"

The cracks indicated may, as suggested, have been due to the explosion, but those that have recently developed are in all probability due to the building being on clay. The pitch boilers appear to be at some

distance from these cracks, but even if they were close the clay would be the more likely element of disturbance. It is not safe to build upon clay unless hoop-iron bond is built in the footings or other means are taken to hold the work together. However hard the clay may appear to be, it is always on the move with changes in the weather, and no building erected upon it is safe from cracks unless specially designed. The writer has had numerous cases put before him at various times which were only explainable on this hypothesis. If the ground is on the slope of a hill the action is intensified.

HENRY ADAMS.

Roof of Two Pitches.

ROCHDALE.—W. T. D. writes: "To find the length of hip rafters when the slope of the roof is 60 degs. and hip rafters 30 degs. How can this be determined?"

Let AB (Fig. 1) represent the span of roof. From A and B set up angles of 60 degs. to intersect in point C; then DC will be the vertical height from eaves to ridge. Next select any point on the ridge, as E (Fig. 2), and at any angle set up EF equal to DC; also from EF set out lines EG at right angles and FG at 60 degs., meeting at the required angle of 30 degs. in point G; then FG is the true

Fig 1

Fig 3

Fig 2

ROOF OF TWO PITCHES.

length of hip rafter. Now with a radius of half span = AD swing an arc with centre at E; then lines parallel with ridge and tangent to the arc will give the lines of eaves, which should be produced indefinitely. Next, with centre E and radius EG swing the arc GH and produce the eaves lines until they intersect the arc in points J and K. Join JK, JE and KE, and the plan (Fig. 2) is complete. Fig. 3 shows an isometric sketch of the hipped end of roof, from which it will be seen that the result would be very unsightly; in fact, the enquiry reads like an ill-considered examination question.

HENRY ADAMS.

Black Paint for Drawing-board.

WINCHESTER.—X. writes: "Please name a paint or chemical for applying to a drawing-board so as to make it like a blackboard so used in schools, &c."

A number of paint firms make a black-board wash, and to purchase from them saves much trouble.

Bats in a Church.

LONDON.—FLITTER-MOUSE writes: "I was told recently that I had brought the architectural profession into disrepute by being unable to advise a vicar as to how he might get rid of bats in his church, which cause great inconvenience and labour by fouling everything. Stopping up the places at which

they enter is quite impracticable, and my friend's intention of burning sulphur candles appeared to me to be unlikely to produce any permanent benefit. Presumably a poison would only be effective while it remained, and it would entail a heavy task on the sexton. I shall be glad of any suggestions as to how to meet the difficulty, which must be fairly common."

It is probable that if the church were used more frequently the bats would desert it! The remedy will certainly require the exercise of patience, but I know of nothing better than that the bats should be caught during the daytime, when they will be found clinging to the walls above the places where their droppings are found to be a nuisance. I do not think the other plans you mention will be of any use. F. S. I.

Finish for Oak Floors.

WOODFORD.—H. G. writes: "Which is the best way to treat newly-laid oak floors without polishing them? Is linseed oil and beeswax rubbed in hot the best foundation, afterwards rubbing from time to time with the oil?"

Linseed oil for a first coat, and afterwards, and from time to time, rubbing with beeswax and turpentine.

Musty Smell in Rooms.

KILDARE.—L. T. writes: "Having erected an hotel here, we found after a few months that a fibrous plaster cornice opened up at the joints. It was repaired with oil putty. The rooms where the repairs were done now have a musty smell. Would this be due to the repairs?"

Oil putty would not cause a musty smell. It must be due to some other cause.

Architect's Fees on Joinery Work.

LONDON.—ARCHITECT writes: "Some clients of mine, who are the lessees of a large ground-floor shop, recently fitted it up as a showroom and offices. The lessors (who are builders) made a private arrangement with the lessees that they, the lessors, should erect all the partitions, showcases, shelving, &c., free of charge. The drawings for this joinery work were prepared by me, and firms were requested to tender for making and delivering the fittings only. The lessors tendered, but another firm put in a lower price and obtained the work. I superintended the construction and also supervised the lessors during erection. I have sent my clients a statement of my fees and have charged a commission on the certificate sent to the builders who made the fittings. I have also ascertained from the lessors how much the work cost them to erect, and have charged a commission on this. My clients

state that I am not entitled to charge commission on work executed free of charge. Although I agreed to accept a commission on the cost of the work, I fail to see that if the lessors execute work for nothing (probably in order to obtain the rental asked) I should not be entitled to my fees for superintending. I shall be glad of your opinion on the matter."

We certainly think that you are entitled to the commission you have charged.

Keystones.

Extensive Additions to the Y.M.C.A. Institute at Leslie are to be made from plans by Mr. Peter L. Henderson, of Edinburgh.

A new Fire-station at Knightsbridge, at the junction of Hooper's Court and Basil Street, is to be built by the London County Council at a cost of £14,600.

The Bridge in the High Street, Tunbridge Wells, is to be rebuilt at a cost of £14,000. It crosses the line of the South-Eastern Railway, and the company have consented to bear one-third of the cost.

A Roman Pavement at Dorchester which is believed to be one of the most perfect examples of ancient Roman mosaic flooring was found recently. It is to be taken up and relaid in the Dorset County Museum.

New Buildings in Nottingham for the Industrial Institution for the Blind are nearing completion. Erected in two blocks, each three storeys high, the total cost, including furnishing and equipment, will be about £12,000.

A new Police- and Fire-station at Windsor is being erected. The buildings will include a police-court, chief constable's residence, inspectors' and sergeants' offices, quarters and recreation-room for single constables, drill-room and fire-station. The total cost is placed at £16,000.

The Chancel of Starcross Church has been altered and re-decorated from plans prepared by Mr. C. J. Tait, A.R.I.B.A., of 6, Staple Inn, London. The altar, altar rails and flooring were all removed and replaced with new carved altar and altar rails, and the chancel laid with Connemara marble. The decoration of the walls was carried out by Messrs. F. Drake & Sons, of Exeter.

The Waterloo Bridge Lamps.—At last week's meeting the London County Council adopted the recommendation of the Bridges Committee to replace the original bronze lamp standards on Waterloo Bridge, for which the present electric-light standards were substituted a short time ago. The electric light is to be discarded and incandescent gas adopted, as it is estimated to be cheaper.

A Florentine Palace.—The stately old Palazzo dell' Arte della Lana behind the church of Or San Michele at Florence (which had long been falling into disrepair, while many of its most interesting features, especially in the interior, were hidden under additions of a later age) has now, owing to the munificence of a millionaire, been purchased from the municipality by the Italian Dante Society and carefully restored by Prof. Enrico Lusini.

St. Gregory's, Norwich, is being restored. It was founded in 1210, rebuilt in 1394, and is unique in that "city of churches" by reason of its Galilee porch, sanctuary knocker and because it is the only church besides the cathedral which anciently had a spire. The sanctuary knocker was fixed upon the south door and is of fourteenth-century work. The general design is a lion's head, from the jaws of which issues a human face. The ring has disappeared, and the scutcheon was removed for safety to the interior and is now fixed on the vestry door.

Permanent Asylum Buildings at Banstead are to be erected in place of the temporary buildings, at a cost of £30,763.

A Public Hall at Darnall, Sheffield, was opened recently. The architect was Mr. A. E. Turnell and the contractor Mr. George Carr.

Embankment and Over-bridge Trams.—In the next session of Parliament the L.C.C. Bill for the construction of tramways over Blackfriars and Waterloo Bridges and along the Embankment, which was recently rejected by the House of Lords, will be reintroduced.

The Tower of Upton Church, Slough, one of the oldest and most famous in the country, is about to undergo repair, and the opportunity is to be taken to remove the "extinguisher" roof, which is not part of the original Norman design.

A.A. Day School.—The 1905-06 syllabus for the day and evening continuation schools of the Architectural Association has just been issued. The winter term commences on September 25th. Drawings prepared in the day school may be submitted in lieu of testimonies of study for the R.I.B.A. intermediate examination, and it is now proposed that students who have completed the four years' course shall be exempted from this examination.

Royal Blind Asylum and School, Edinburgh.—Great improvements are to be made in connection with this institution. Mr. J. Macintyre Henry, of Edinburgh, is submitting plans to the committee. The principal features are the addition of another storey to the Craigmillar Institution, the modernizing of the sanitary arrangements, and the improvement of the workrooms at Nicolson Street. The total cost will probably amount to £20,000.

The Rebuilding of St. Mark's Campanile, Venice, is being regularly proceeded with. The work has now reached the level of the ground, and the engineers hope to get several metres up during the autumn. The foundation has been very carefully and solidly extended considerably beyond the limits of the old one. The difficulty of dovetailing the new work with the old has been the principal cause of the delay. But this has been most admirably accomplished, and it is hoped now to get ahead with the above ground shaft more quickly than was expected. Nearly all the pieces of the Loggetta have been found and can be put together.

Competitions.

New Town Hall, Dartmouth.—In the conditions of the competition for a new town hall, municipal offices, market and other buildings proposed to be erected on the site of the existing market at Dartmouth, the town council reserve to themselves the right to select what they consider to be the best designs, though they speak of "calling in such expert advice as they may consider necessary to assist them in making such selection": moreover, they reserve "the right to use the whole or part of either of the successful designs, or to cause plans to be prepared embodying ideas that may be contained in either or all of such designs, if in the opinion of the Council it is desirable to do so." These conditions are unsatisfactory and unfair, and should be taken into account by intending competitors. Three premiums are offered, respectively £50, £30 and £20, and designs are to be submitted by September 23rd.

COTTAGE HOMES OF THE FURNITURE TRADES' BENEVOLENT ASSOCIATION AT RADLETT
R. FRANK ATKINSON, F.R.I.B.A., ARCHITECT.

FURNITURE TRADES' COTTAGE HOMES.

WE illustrate above the first two cottage homes of the Furnishing Trades' Benevolent Association at Radlett, a pretty Hertfordshire village about fifteen miles from London. Under the direction of Mr. R. Frank Atkinson, F.R.I.B.A., these homes have been transformed out of four cottages and were recently opened by Mr. S. J. Waring, junior, the president of the Association. They are for the benefit of the children of the necessitous widows of trade subscribers to the Association, and are regarded as the nucleus of a future colony conducted on the same philanthropic and benevolent lines. One of the homes is for twelve boys and the other for twelve girls. Each will be under the charge of an experienced matron.

MR. S. J. WARING, JR.

EFFLORESCENCE ON CONCRETE.

THE white efflorescence which comes out on the surface of walls newly plastered with cement or constructed of cement-concrete is undoubtedly an eyesore, and is a constant source of trouble, as it takes a considerable time to wear off and is expensive to remove. Some recent investigations on the subject have been conducted by Mr. Beaumont Jarvis, of Toronto, Canada, which are valuable. The experimenter tried to get rid of the efflorescence on the face of concrete building blocks by washing the cement before mixing it with the aggregate. As the components of efflorescence are obviously soluble, this seemed a feasible way to separate them from the cement. In order to test the effectiveness of the method of procedure and also to find out how the strength of the cement was affected by it, he put the matter in the hands of Mr. J. C. Johnston, analyst for the Municipality of Toronto, who reported as follows:—

Analysis of the Cement.
Throughout the entire tests Alsen's German Portland cement has been used. This cement has the following chemical analysis:—

Silica	-	-	-	-	-	Per cent.
Alumina	}	-	-	-	-	22.44
Iron oxide	}	-	-	-	-	8.95
Lime	-	-	-	-	-	61.44
Magnesia	-	-	-	-	-	2.45
Anhydrous sulphuric acid	-	-	-	-	-	1.17
Alkalies	-	-	-	-	-	0.82
Carbon dioxide	-	-	-	-	-	1.45
						98.72

A physical test of the cement resulted as follows:—

Specific gravity	-	-	-	-	-	3.09
Fineness, residue on No. 100 sieve, per cent.	-	-	-	-	-	8.50
Hot test—sound (i.e., no free lime in the cement).	-	-	-	-	-	
Setting, initial	-	-	-	-	-	175 minutes.
„ final	-	-	-	-	-	355 „

Tensile Strength.		
	Neat.	3 Sand to 1 Cement.
24 hours	277 lbs. per sq. in.	63 lbs. per sq. in.
7 days	610 „ „	178 „ „
Water used in mixing	24.5 per cent.	10.0 per cent.

Both the chemical analysis and the physical examination show that the cement is first-class.

Analysis of the Deposit.
Now the first step was to make an analysis of the white deposit taken from the surface of a concrete block. The result of this operation was that the deposit was found to be composed of—

Silica	-	-	-	-	-	Per cent.
Alumina and iron oxide	-	-	-	-	-	6.74
Lime	-	-	-	-	-	2.20
Magnesia	-	-	-	-	-	10.15
Anhydrous sulphuric acid	-	-	-	-	-	2.86
Carbon dioxide	-	-	-	-	-	6.45
						39.66
						68.06

leaving a balance of 32 per cent., which on analysis proved to be largely a soda compound. This would, in the deposit, be combined with the carbon dioxide in the form of sodium carbonate to the extent of 70 per cent. of the total. The above analysis shows conclusively that the deposit is nearly all sodium carbonate with a small percentage of a sulphur compound, very probably calcium sulphate, as this substance is often added to a cement in manufacture to make it slow setting. The silica, iron oxide, alumina, lime and magnesia, in all probability had been in the small quantity of cement that was scraped from the concrete block while sampling.

The Result of washing the Cement.
Now after treating the cement in the manner suggested, and collecting the scum that appeared on the surface of the water, and also the surplus water, the scum was found to be composed of—

Silica	-	-	-	-	-	Per cent.
Alumina and iron oxide	-	-	-	-	-	19.45
Lime	-	-	-	-	-	6.50
Anhydrous sulphuric acid	-	-	-	-	-	47.94
Magnesia	-	-	-	-	-	4.48
Carbon dioxide	-	-	-	-	-	2.08
						16.73
						97.19

The low percentage of lime, with the high percentage of carbon dioxide indicates, Mr. Johnston thinks, that the fine underburned particles of cement rise during the manipulation and with, of course, a large proportion of cement form a scum. In this scum is a considerable quantity of sulphuric acid. The scum weighed only a small fraction of 1 per cent. of the total cement used. The analysis of the surplus water disclosed the fact that the objectionable sodium carbonate was in solution. In fact, from 800 grains of cement 3,563 grains of sodium carbonate were obtained, or nearly 0.5 per cent.

An analysis of the cement in the first place showed alkalies (or sodium oxide and potassium oxide) 0.82 per cent. Now assuming that three-fifths of this 0.82 per cent., or about 0.5 per cent., of the cement was sodium oxide, we could have 0.8 per cent. of sodium carbonate, or in other words there was only enough sodium in the cement to make 0.8 per cent. of sodium carbonate. Nearly 0.5 per cent. had been removed by the treatment, and as some of the sodium must be intimately combined with the cement, there could not, in Mr. Johnston's opinion, be enough left to cause an appearance of the white surface deposit.

Strength not affected by Treatment.
A test made of the cement, after the treatment, shows that the strength in a few days was considerably increased. The following is the result of the test:—

Tensile strength	-	-	-	3 (sand) to 1 (cement).
24 hours	-	-	-	41 lbs. per sq. in.
4 days	-	-	-	162 „ „
7 days	-	-	-	215 „ „

Referring to the test of the cement before treatment, it is seen that the tensile strength 3 to 1 was for twenty-four hours 63 lbs. per sq. in.; for seven days, 178 lbs. per sq. in., or after treatment to remove sodium carbonate, the strength of the 3 to 1 concrete was in twenty-four hours 35 per cent. lower than when not treated, due entirely to the fact that a large percentage of water was of necessity used in mixing, and when such is the case the hardening is more gradual than when mixed drier. In seven days, however, it was, as shown by the above, 21 per cent. higher than in the ordinary test.

The above analysis and figures tend to show conclusively that the treatment not only gets rid of the objectionable sodium carbonate, the cause of the white surface deposit, but also increases the strength of the concrete.

Effect of Dust in Aggregate.
Mr. Johnston also made a test to establish the relative values of aggregate with and without dust. The result of the tests was to establish in every case greater strength for the mortar which included the dust.

1 Part Lehigh Cement with 3 Parts of—	Tensile Strength (lbs. per sq. in.) 7 days. (Average of 4 tests in each case.)
Unscreened limestone	366
Limestone retained on No. 100 sieve (without fine powder)	343
Limestone that passes No. 6 sieve and is retained on No. 100 sieve (i.e., without powder)	410
Limestone that passes No. 8 sieve and is retained on No. 100 sieve (i.e., without powder)	381
Limestone that passes No. 10 sieve and is retained on No. 100 sieve (i.e., without powder)	360
Limestone that passes No. 10 sieve and is retained on No. 100 sieve (i.e., without powder)	356
Limestone that passes No. 10 sieve and is retained on No. 100 sieve (i.e., without powder)	339
Lake sand (Sand and Dredging Co.)	295
Standard quartz sand	270
Limestone dust (i.e., what passes No. 100 sieve)	191

THE TIMBER TRADE.

London Market in July.

REPORTS of the London timber trade during July are to hand, but further reports (more especially those of Messrs. Churchill & Sim, relating to soft woods) are yet to come and will be published in our next issue.

Messrs. Denny, Mott & Dickson, Ltd., report that the heat and holiday season combined to rob business of all animation during July, and nothing beyond hand-to-mouth business can now be expected until the concluding quarter of the year. The hardwood market generally has been in a sound condition with advancing values, which are justified by the moderate supplies. The softwood trade has, however, been consistently dull, and whilst it has been generally felt that there has been no room for prices to go lower, it must be acknowledged that selling rates still give little or no profit to holders after due allowance for storage and interest changes.

American Whitewood.—While first quality is fairly steady, the lower grades are doing badly. The supply of medium quality and culls is far in excess of the demand. Prices range from 2s. 3d. to 3s. 6d. per cub. ft. for first quality, 1s. 9d. to 2s. for clear saps, 1s. 6d. to 1s. 9d. for medium, and 1s. to 1s. 3d. for culls.

Hardwoods.

Teak.—Messrs. Denny, Mott & Dickson, Ltd., report that the landings in the docks in London during July consisted of 189 loads of logs and 261 loads of planks and scantlings, a total of 450 loads, as against 264 loads for the corresponding month of last year. The deliveries into consumption were 1,081 loads of logs and 295 loads of planks and scantlings—together 1,376 loads, as against 616 loads for July, 1904. The inadequate supplies of first-class timber are, as expected, causing experimental shipments of distinctly inferior or second-class quality to come forward in increasing quantity. Consumers, however, are not yet prepared to buy unsightly wood—even at a very appreciable reduction; but in a time of scarcity conservatism may bow before necessity, and it is now beyond controversy that the supply of first-class timber for some time ahead cannot fill the demand.

Mahogany.—Supplies have been insignificant; and although the volume of business is restricted by the unduly light stocks, the tone of the market is somewhat better, and prices are naturally harder for such small supplies as have been obtainable at auction.

Odessa Oak.—The enquiries for this wood continue to out-run the volume of supply. Prices have hardened very appreciably, and consumers have shown very clearly that careful shipments of this high-class wood will find a ready market, and it is to be hoped that the political disturbances at Odessa will not hamper the production.

Obituary.

Lieut.-Col. Stirling died suddenly in an Edinburgh hotel recently. He was an architect and surveyor, and for twenty-one years had been borough assessor of Stirling.

Mr. Thomas Finlayson, civil engineer, whose death in his eighty-sixth year is announced, entered the office of Messrs. Ross & Mitchell in early life and did useful work in connection with the construction of the Balloch Mile Bridge in Ayrshire, which was then the largest stone bridge in the world. In 1859 he went to India as civil engineer in connection with the then new Madras Railway. He retired from active service in 1862.

NOTICE TO OUR SUBSCRIBERS.

THE INDEX OF "THE BUILDERS' JOURNAL."

The Title Pages and Index to any volume of "THE BUILDERS' JOURNAL" may be had free, upon application being made to the Office, Great New Street, enclosing 1d. stamp to cover postage of same.

VOLUMES I. to XIX. of THE BUILDERS' JOURNAL.

Handsomely bound in cloth gilt, 7/- each. Binding Cases for any of the above Volumes can now be obtained, price 1/9 each.

To Contributors.

THE EDITOR will be pleased to consider any articles, illustrated or otherwise, dealing with old and new buildings, methods of construction, or other matter of an architectural character. He will also be glad to consider architectural photographs and sketches (the latter preferably in black and white) and measured drawings of work in this country or abroad. News items of interest to architects and builders will also be considered, provided the name and address of the sender are given; no notice will be taken of anonymous contributions. All communications should be addressed to the Editor of THE BUILDERS' JOURNAL, 6, Great New Street, E.C.

EMPLOYMENT REGISTER.

Too late for Classification.

1284.—GENERAL FOREMAN or Clerk of Works (48); exp. in all branches; accurate setter-out; good refs.; mod. s.

See p. xx for the Employment Register.

Contracts Open.

BUCKS COUNTY EDUCATION COMMITTEE.

The Education Committee invite APPLICATIONS from firms of Contractors desirous of TENDERING for the ERECTION of new ELEMENTARY SCHOOLS, for about 750 children, proposed to be erected at Aylesbury, in accordance with the drawings and specifications prepared by the Architects, Messrs. JOHN MOIR KENNARD and HAROLD KENNARD, 13, Railway Approach, London Bridge, London, S.E., and quantities prepared by Messrs. W. T. FARTHING & SON, 46, Strand, London, W.C.

A charge of £1 rs. will be made for each set of quantities issued to applicants, which will be returned on receipt of bona-fide Tender on or before the prescribed date. The firm whose Tender is successful will, if the work be proceeded with, be required to enter into a Contract and bond with two approved sureties to the amount of £500 for the due performance of such Contract.

The Committee do not bind themselves to accept the lowest or any Tender for the work. Drawings, specifications, and conditions may be seen at the Office of the ARCHITECTS, or by appointment at the Department of CLERK of WORKS, Education Office, Aylesbury.

Applications must be sent to the undersigned on or before the 15th day of AUGUST, 1905. Tenders must be submitted not later than WEDNESDAY, 20th SEPTEMBER, 1905, and endorsed "Tender, Aylesbury Council School."

C. G. WATKINS,
Education Secretary.
Education Office,
Aylesbury.

KENT EDUCATION COMMITTEE. TO CONTRACTORS.

The Kent Education Committee invite TENDERS for the ERECTION of a NEW COUNCIL SCHOOL at Eynsford Crockenhill, Kent.

The drawings and specifications may be inspected at the Office of the Architect, Mr. W. HARSTON, 8, Hythe Street, Dartford, where also bills of quantities and form of Tender may be obtained on and after FRIDAY, the 11th day of AUGUST, 1905, on payment of a deposit of £1. The deposit will be returned on receipt of a bona-fide Tender.

Tenders, on the form supplied, to be delivered to Mr. J. C. HAYWARD, Sessions House, Dartford, not later than TWELVE NOON on MONDAY, the 21st day of AUGUST, 1905.

The Committee do not bind themselves to accept the lowest or any Tender.

By Order of the Committee,
FRAS. W. CROOK,
Secretary.

Scale of Charges.

For Official Advertisements.

6, Great New Street, Fetter Lane, E.C.

SUBSCRIPTION, POST FREE, 10/10 PER ANNUM,

or of any Newsagent or Bookstall,
2d. weekly.

Subscription Abroad,

17s. 4d. Post Free.

If you are not already a Subscriber, it will more than repay the small outlay to become one, and thus keep yourself posted in what is doing in the Architectural and Building World.

Privileges open to all Regular Readers of the "Builders' Journal."

I.—Free Monthly Advertisements.

1. A Free Advertisement of 12 words in the Wanted or Miscellaneous Advertisement Columns, in one issue of the BUILDERS' JOURNAL during each calendar month will be given to any regular reader.

2. The charge of one penny will be made for each additional word.

3. Advertiser's Name and Address or Box Number must be counted, but will in no case be reckoned as more than five words.

4. All advertisements must be accompanied by the correct remittance, and should a receipt be required a stamped addressed envelope must be enclosed.

5. The Proprietors reserve to themselves the right of refusing any advertisement.

II.—Free Answers to Enquiries.

1. The services of a large staff of experts are at the disposal of all regular readers who require information on architectural, constructional or legal matters.

2. Questions should in all cases be addressed to the Editor, and be written on one side of the paper only.

3. Correspondents are particularly requested to be as brief as possible.

4. The querist's name and address must always be given, not necessarily for publication.

Note.—Owing to the large number of enquiries we receive weekly, we are compelled to restrict the advantages of this department to Regular Readers.

III.—Free Accident Insurance of £500.

1. Every regular reader of the BUILDERS' JOURNAL is entitled to the benefit of this Insurance.

2. A Pamphlet giving full details of this and other Insurance schemes inaugurated by the BUILDERS' JOURNAL for the benefit of its readers, and guaranteed by "The Ocean Accident Corporation, Limited," will be sent on application.

What is a Regular Reader?

We have employed the term "Regular Reader" throughout these announcements as the description "subscriber" is often understood to mean one who subscribes direct to the publishing office.

We mean by a Regular Reader anyone who has placed an order with us or any newsagent or bookstall for the BUILDERS' JOURNAL for one year.

Those readers who order the BUILDERS' JOURNAL through their local newsagent or bookstall should send us the newsagent's receipt. Their names will then be placed on our subscribers' list, and they will be entitled to all the advantages set out above.

5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS.

OFFICE: 6, GREAT NEW STREET, FETTER LANE E.C.

LIST No. 2 of DRAWING OFFICE REQUISITES. BOXWOOD SCALES.

Architect's.

Builder's.

Armstrong.

For Technical Students, Architects, Surveyors, &c.

12-in. Draughtsman's Boxwood Scale, flat or oval section	1/-	each.
12-in. Universal Scale, or Builder's, oval top	1/-	"
12-in. Architect's Scale, bevelled, flat section	1/-	"
12-in. Armstrong or Engineer's Scale, oval section, 8 scales ..	1/-	"
6-in. do. do. do. do. do.	9d.	"
12-in. Engineer's Scale, oval section, best, parts divided to $\frac{1}{4}$ inches ..	2/-	"
12-in. Engineer's, oval section, fully divided, 4 scales	3/-	"
12-in. Surveyor's Chain Scale (40 chains to an inch)	1/3	"
12-in. do., any parts divided to 60 chains to an inch	1/9	"
12-in. Ordnance Scale, or to special order	2/-	"
Set of Boxwood Chain Scales and off-set in box	18/-	"
Best do., in lock and key box	21/-	"

A Perfectly Safe Pocket Compass (Patent).

Price 6d. each.

This Compass has a Reversible Point fitted with double screw ends. It takes any pencil, is easily adjusted, and always ready for use.

POCKET DIVIDER, With Metal Point-Guard.

Divider, with sheath or point-guard screwing on, and loop at the end. Electrum, 3/- each.

CELLULOIDE SLIDE RULES

Student's Slide Rule, Boxwood, 10 in. 4/6 each.
Pocket Slide Rule, in neat leather case, $5\frac{1}{2}$ in. 7/6
Slide Rule, with Glass Cursor in Case, complete with instructions, 10 in., 10/6; 14 in., 32/-; 20 in., 50/- each.

THE PHILOTECHNIC SET (Registered).

Consisting of two double-bevelled Boxwood Rules in case, forming a series of most useful scales for practical draughtsmen and all engaged in engineering, building construction, drawing, and other allied pursuits, 1/- per set.

* * * An indispensable Technical Student's Companion.

CARDBOARD SETS OF SCALES.

A set of 8 stout cardboard slip rules, fully divided on both edges, and forming 16 scales, suitable for architects, engineers, technical students, &c., in cardboard case, 6d. per set.

The Draughtsman's set of cardboard rules, sized and varnished; in neat case, containing the following 12 in. scales: (A) full and half size, and line of chords; (B) 4 in. and 2 in.; (C) 3 in. and 1 1/2 in.; (D) 1 in. and 1/2 in.; (E) 3/4 in. and 3/8 in.; (F) 1/2 in. and 1/4 in.; (G) 1/4 in. and 1/8 in.; (H) 1/8 in. and 1/16 in., 10d. per set.

12 in. ebony rolling parallel, plain edges	9/-	each
12 in. do. do. divided ivory edges	12/-	"
12 in. mahogany rolling parallel, ebony edged	4/-	"
15 in. do. do. do. do.	5/-	"
18 in. do. do. do. do.	7/-	"

SOLID BRASS ROLLING PARALLELS

Prepared for Hot Climates, and fitted with Lifting Knobs. In polished mahogany case.

9 in. solid brass rolling parallels, bright or bronzed	21/-	each.
12 in. do. do. do. do.	30/-	"
15 in. do. do. do. do.	35/-	"
18 in. do. do. do. do.	45/-	"

N.B.—When ordering, please state whether BRIGHT or BRONZED metal.

ROLLING PARALLEL RULES.

The above Prices include Postage within the United Kingdom.

The instruments, &c. that are sent out by The Builders' Journal Supply Dept. are of the highest quality, but should they in any case not meet the requirements of our Correspondents we are at all times willing to return remittances and take back the articles.

WE SHALL BE PLEASED TO ARRANGE SPECIAL TERMS FOR SCHOOLS, TECHNICAL INSTITUTIONS, &c.

THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

August 16, 1905. Vol. 22, No. 549.

6, Great New Street, Fetter Lane, E.C.

Summary.

The restoration works at Iona Cathedral have been severely criticized by Mr. A. C. Champneys, who is replied to by Mr. J. Honeyman, the architect responsible for the work. (Page 97.)

The returns in the London Timber Market for July show a rather more satisfactory position as regards the total delivery from the docks and direct from ship to craft if taken together, although the results for the year so far show a deficiency of 6,000 standards compared to those for 1904, and 12,000 standards for 1903. There is no doubt that the condition of the building trade in and around London is responsible for a good deal of this shrinkage in the demand, but to this cause must be added the competition of other avenues of supply outside London, which are restricting the area of delivery from that port to some extent year by year. (Page 92.)

This year's excursion to Lisieux, Normandy, was one of the most delightful of any organized by the Architectural Association. Numerous chateaux and farmhouses in the neighbourhood were visited. The most striking characteristics of these French houses are the fine slate or tile roofs, very steeply pitched, the extensive use of dormers to break up the roof, and walls built of ashlar and brick, often in chequer work or patterned in some way. They belong to the sixteenth and seventeenth centuries. (Page 88.)

Asked whether, in view of the opinion held by competent authorities of the cheap cottages now being exhibited at the Garden City at Letchworth, the Local Government Board would take into consideration the question of further modifying the model by-laws issued for the guidance of district councils, Mr. Gerald Balfour replied that it was, he thought, desirable that in the first instance an officer of the Department should visit the exhibition and report on the subject. (Page 93.)

Vanbrugh's style of architecture was only suitable to the largest of buildings, and was even then the occasion of much sarcasm and ridicule from the wits of his day; one of his buildings was likened to a dog-kennel, another to a pie, and a third to a coal scuttle, a flat candlestick, a piece of floorcloth, a snail, a chaise, a tilt in a boat, a house of cards, a mouse trap, and so on. (Page 93.)

One of the Canadian Budget proposals is to raise the tariff on dry white lead from 5 per cent. to 30 per cent., in the interests of British Columbian leadminers and Montreal producers of this commodity. (Page 96.)

A Note on Windows.

It is surprising what little attention is devoted by English architects to the designing of windows in buildings. The lighting of interiors by artificial means has been the subject of numerous papers and discussions, but the lighting of rooms from the exterior by ordinary daylight seems only to attract attention from the point of view of ancient lights. Not only do windows have an important bearing upon the efficiency of a building for the uses to which it is put, and upon the health and physical fitness of the inmates, but the subject is also important on its artistic side, for much of the charm of an interior may be dependent on skilful lighting. On utilitarian grounds the importance of exterior lighting is so great that it is surprising that there has not been a crusade waged in this respect as fiercely as over other subjects affecting the health and livelihood of the community. In the United States a great deal more attention is paid to the matter. It is now beginning to be recognized that the weak eyesight of many persons is due to the bad lighting of school-rooms in which they spent many hours of their childhood. In regard to such buildings regulations have now been made to prevent much mischief in the future, but the small window in many houses undoubtedly contributes in a similar way to defective vision. To secure sunlight in a room during a portion of the day is now recognized as necessary to health. This of course vitally affects the whole planning of the building, the choice of the site and the laying-out of streets; and in so far as the last is concerned the problem should be taken in hand by public authorities. With the exception of shops, where an unreasonable fashion prevails for enormous areas of plate glass, the windows of commercial premises are often too small, and in office premises especially architects neglect to provide sufficient window space. Architects seem to have an objection against ample-sized windows, and there is a good deal of prating about the quality of large unbroken surfaces, but when plenty of light is required the conditions should be frankly accepted, for if modern conditions are to be overridden there can be no advance in architectural art. The tall office building with its small amount of wall surface and multitude of large windows creates a very difficult problem, one which has been taken in hand by American architects and successfully

solved in many cases, leading to an altogether new expression which, although it does not conform to the older canons of proportion, has undoubtedly a beauty of its own. Combined with the problem of providing large windows are a number of other details for affording ready means of keeping windows clean and not obscuring the light, which has a financial value; such are reversible fittings to enable a window to be cleaned from the inside without risking life and limb, and guard rails and platforms on the roofs of buildings to enable skylights to be got at for cleaning. Then there are the various prismatic glasses and mirrors on the market for gathering a greater quantity of light into rooms in confined areas, the means of securing glass in window frames, the composition of the putty, means of excluding rain from penetrating into the interior, and numerous other matters of detail. The colour of glass even is now important in the treatment of certain physical and mental diseases, and this needs consideration in the planning of hospitals especially. In domestic architecture the treatment of windows is often carried to an absurd pitch. Names carry off a great deal of criticism. The architect regards a design by a well-known man in a very different way to the average man, and in this connection the criticism of ladies who know nothing about "who's who" in the architectural world, but nevertheless possess a very keen sense of what they want in a house, is sometimes instructive and amusing in respect of the windows which some architects are fond of providing—squat little windows up at the ceiling, with tiny panes which give no end of trouble in cleaning, and windows sometimes which cannot be got at for cleaning—windows freed from the all-prevalent curtain and consequently not by any means in favour in the eyes of women. Architects need not despise such criticism. Maybe it is not prompted by much professional knowledge, but the old saying of onlookers seeing most of the game has an application here, and we think that the remarks of some of the onlookers as to the feebleness and foolishness of the windows of some houses designed by architects with a touch of the eccentric in them are very much more to the point than the diatribes levelled against the poor householders who are so beneficently allowed to live in such rooms.

By Leonard Sutton Wood.

THIS year's expedition must surely rank among the most delightful of the Association's annual excursions. "The Sunny Land of France" fully justified its name, and the secretaries had arranged a most interesting series of visits to the neighbouring chateaux round Lisieux. Several members of the party managed to put in a few days in advance, and made the journey by road from Le Havre to Lisieux, visiting the quaint old town of Caudebec-en-Caux with its great flamboyant church, curious Renaissance west door and some of the finest old glass left in France, and also Pont Audemer with its unfinished church. Many of these small French towns have magnificent churches only partially finished, the great stone towers often being capped with curious slate roofs in place of the stone spire originally intended. St. Jacques, at Lisieux, and the church at Pont L'Eveque shown in the sketches are examples. The excursion headquarters at Lisieux was the Hotel de France. On Monday, Hermival, Ouilly du Houlay and Fumichon Chateaux were visited.

The most striking characteristics of these French houses are the fine slate or tile roofs, very steeply pitched, the extensive use of dormers to break up the roof and walls built of ashlar and brick, often in chequer work or

patterned in some way. They belong to the sixteenth and seventeenth centuries and consist usually of a main block with other blocks of outbuildings forming a courtyard. Moats still surround most of the houses, showing that the necessity for defence still existed when they were built. Ouilly du Houlay is a good example, and one of the finest we visited. The interior, with massive stone staircases and great well-lit panelled rooms, is also very fine.

On the return on Monday evening the party were received at the Hotel de Ville by the Mayor and Council of Lisieux; the mayor, accompanied by Monsieur Campserveux, the town architect, afterwards showed the party over the new hospital.

On Tuesday the party took train to Pont L'Eveque, a little town about ten miles from Lisieux, which is famous for its particularly rank local cheese. It abounds with delightful old half-timbered houses. Its church, of which a sketch is given, is also interesting. One rather doubts whether the huge bulk of masonry of the tower crowned with simple slate cap could be improved by finishing the stone spire. Inside the peculiar Renaissance bosses to the vaulting are deserving of notice.

There are also two typical old French town houses at Pont L'Eveque, one of which originally belonged to Melle de Montpensier, and the other (now the Sous-Prefecture) was formerly the Hotel de Brilly.

After lunching at the comfortable Lion D'Or with its old-fashioned balconied courtyard, the party drove out to Canapville Manoir, a picturesque farmhouse, the oldest part of which probably dates back as far as the fifteenth century. Then to St. André-D'Hébertot Chateau which there was some difficulty in finding, owing to the incompetence of the driver. The house is beautifully situated in a wooded valley; lit by the last rays of the setting sun, with its white walls reflected in the encircling moat, it formed a striking picture.

On Wednesday the morning was spent in exploring the old streets and houses of Lisieux, for which too little time was given. The famous Salamander House in the Rue au Fevres, and the little museum behind it attracted many, while others visited the cathedral and the curious church of St. Jacques (1496-1540). After lunch the party drove out to the Chateau of St. Pierre Mailloc, where the Count de la Place kindly showed them round the interior. Some of the rooms were hung with magnificent tapestry. Mesnil-Guillaume Chateau, which was visited on the way home, is now uninhabited. The interior contains some delightful woodwork and ironwork.

The first of Friday's visits was to a typical old Norman farm just outside Lisieux, known as Defougy Farm. The great stone fireplaces, the old hinges, bolts and latches, and the fine outside stone staircase with its overhanging roof, provided abundant material for notes and sketches. Luncheon was taken at St. Hippolyte Manoir, a picturesque old place, now uninhabited—the case with too many of these old houses. It is well situated on the slope of a wooded hill, at the foot of which runs a small river. The whole front was well worthy of a careful measured drawing, but this being impossible, attention was confined to details, such as the fine dormer windows.

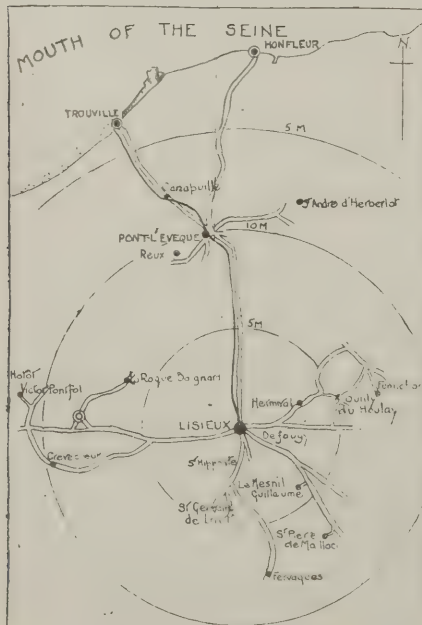

CAUDEBEC-EN-CAUX.

In the afternoon Fervacques was arrived at. Here the Count and Countess de Montgomery were kindness itself in showing the interior and allowing the buildings to be explored. The day closed with a visit to the chateau of St. Germain de Livet, perhaps the most charming of the many delightful places which the president, Mr. Dawber, and Mr. Searles-Wood had found for the party. It is of sixteenth century date, and the gateway towers and front are built in chequers of stone and green glazed brick. One could

St Hippolyte Manoir. 27th

DRAWN BY L. SUTTON WOOD.

MAP OF THE TOUR.

almost imagine it to have been transported bodily from the fairy tales of our early years. In what is now the kitchen are remains of wall decorations in fresco—knights in armour, men-at-arms and pavilions. Here again was tasted the old French hospitality which had been extended to us on most of our visits.

Crêvecœur Manoir, the first on Friday's programme, proved inaccessible to the majority of the party, who contented themselves with viewing it from the road. The few who succeeded in penetrating the wilderness of undergrowth surrounding the remains of the moat, and scaling the walls were not rewarded by any finds of particular interest. An ancient Norman doorway and the great gateway pierced with slits for the archers were noticed. Lunch was taken at Hotot Farm, originally the largest in Normandy, then on to Victot Pontfol Chateau, the owner of which is the only

French member of the Jockey Club, and has an extensive stud. The church adjoining the chateau has an interesting slate spire with dormers. Last came the Chateau de la Roque Baignard. The old sixteenth century gateway tower still retains like many of the other chateaux the vertical slits for the drawbridge chains. The main block is considerably later in date.

Friday evening was devoted to entertaining the mayor and several other guests to dinner at the hotel. Sketches were passed round and criticised, and the evening closed with a pleasant impromptu smoking concert.

On Saturday the party broke up, some returning to Havre *via* Honfleur, where there was time to climb the hill and admire from the Calvary there the magnificent view of sea and sky, with the French Northern Squadron lying at anchor off Havre, dim shapes in the distance. Others—the favoured

Correspondence.

Cheap Cottages Exhibition.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—It appears that one of your correspondents thinks that my cottages at Letchworth do not look as cheap as he thinks they ought to look. I may be mistaken, but I really never supposed that the purpose of the exhibition at Letchworth was to produce cottages to look cheap, and I am very pleased to hear that to the casual observer my contribution appears worth from £700 to £1,000.

I say "casual observer," because a more discerning eye might perhaps have detected, for instance, that the chimney which has so many more corners than a chimney ought to have is not rough-casted, as he states, at all! A little reflection might have revealed the remote possibility that old tiles are not necessarily more expensive than new ones, and indeed are sometimes very much cheaper, and that a single-storey scullery with its special facility for ventilation is not necessarily expensive.

Your correspondent also seems annoyed because the metal-work is "purpose made," and makes various unfounded statements and unnecessary comparisons which I do not propose to discuss. An anonymous writer of this class, who is so blinded by prejudice that he sees rough-cast where there is nothing but brickwork, whose notion of architectural criticism is to count the angles of a chimney, whose notion of the English language involves the use of a barbarous trade jargon, and who makes unfounded statements with no other basis but his own incompetent observation, might have been disregarded were it not that unfuted charges are too often assumed to be proved. I have no reason for doubting Mr. Charles Negus, of Bedford, the builder of the cottages, when he assures me that the work has been done within the limits required by the competition; and it is at least some satisfaction to learn that the cottages convey an impression of costliness far above their actual price.—Yours truly, BAILLIE SCOTT.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The conclusion of the article in THE BUILDERS' JOURNAL on the above exhibition seems to largely consist of a complaint that the exhibitors have considered the conditions of competition more important than the ideas—expressed "at the time"—of the writer of the articles.

Assuming that the competitors have complied with those conditions (and whether they have or have not done so would appear to be a matter entirely between themselves and the judges), it is approaching impertinence to charge them with "self-advertise-

ment" and "misrepresentation" simply because in most cases the total costs exceed by £30 or £50 the nett amounts fixed in the respective classes. The conditions did not state any desire on the part of the committee that competitors should keep the costs much below the limits stated; the competitors consequently would not see any advantage in building cottages in accordance with the ideas of any unconcerned persons with views on the subject.

May we point out that the competitors are not responsible for the unqualified terms "£150 cottage" and "£210 cottage," though these are not misleading to anyone who is at all interested in and conversant with the exhibition.

The remarks about the cost of concrete construction seem to be part of the "nonsense about new materials and methods." We know at least one form of concrete construction in use at the exhibition which works out at considerably less than the cost of brickwork.

A correspondent who hides his identity behind the letter "X." is also responsible for some original comparison. It certainly seems other than accidental that he should ignore the difference between contract and cost

prices. His idea of £700 or £1,000 as the cost of the cottages he mentions seems to indicate that his notions of the cost of building would be well represented by his pseudonym. Is not such a valuation a strain on "the credulity of the profession"?

Perhaps "X." will be good enough to explain what he means by rough-cast angles to a chimney stack. We have not noticed any rough-cast at all on those at Mr. Baillie Scott's cottages.

Surely the last suggestion is not meant to be taken seriously. It implies both a lack of confidence in the judges and a desire to enquire into a matter in which the public have no concern.—Yours truly,

ROBERT BENNETT, A.R.I.B.A., and
WILSON BIDWELL.

[The competition was promoted with the avowed object of solving the problem of housing the agricultural labourer, and the public (from whom contributions were solicited, although our correspondents think it is unconcerned) had a right to expect the competitors to direct themselves to this and not to the winning of prizes by sticking to the letter of conditions, although these, badly drawn as they were, expressly stated the primary object of the exhibition to be

THE CHURCH, CAUDEBEC-EN-CAUX. DRAWN BY L. SUTTON WOOD.

DRAWN BY L. SUTTON WOOD.

are now adding a small percentage of moisture during the grinding process in place of gypsum. This moisture, added in the form of steam, after hydrating any free lime present, hydrates the uncombined aluminates of lime, to which the quick setting of cement is attributed.

If your correspondent "A. H." uses finely-ground and well aerated cement the expansion in his floors is probable due to the fact that concrete, like almost every other building material, expands and contracts with variations of temperature, concrete having the same coefficient of expansion as wrought-iron. In floors of large area, and in fact in all concrete floors, expansion joints should always be left, or trouble will result.

When will engineers and architects refrain from using that very doubtful concrete aggregate—coke-breeze? It has nothing whatever to recommend it except its lightness, and it is certainly not fireproof. One of the finest aggregates for cement-concrete is almost entirely ignored in this country, although extensively used in America. I refer to hard limestone, which on account of its porosity enables the cement to adhere to it more firmly than to any other aggregate I have used, and is almost as hard as granite.

—Yours truly,

W. A. T. FLITTON.

WELLINGBOROUGH.

"to secure the erection of the best £150 cottage." The request for the cost exclusive of the carriage of materials and architect's and builder's fees does not alter the plain meaning of the words. We are quite ready to believe that many "interested in and conversant with the exhibition" were not misled, though the public has been. We can only assume our correspondents have misread our remarks, for we made no charge of self-advertisement and misrepresentation against all and sundry because the stated actual costs exceeded the limits by 15 per cent. or 20 per cent.—ED. B.J.]

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I have been interested in the notices and plans of the cottages at Letchworth recently published in your Journal. The subject is especially interesting to land-owners and their agents. We find it impossible to build good new labourers' cottages for £300 a pair giving sufficient accommodation even in villages where we are not bound by stringent by-laws. We are now building some that will cost very close on £400 the pair—nothing very original about them, but the haulage of materials is an important factor of the cost in the country. Some estimates for the same cottages ran as high as £600.—Yours truly,

J. E. BATCHELOR.

DIGBY ESTATE OFFICE, SHERBORNE.

Expansion in Concrete Floors.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Referring to the correspondence in your columns on this subject, the use of a small quantity of gypsum to regulate the setting of cement can have no deleterious effects. It is a convenient method of introducing a small quantity of sulphuric acid into the cement, and is added during the grinding process. The addition of this minute quantity of sulphuric acid defers the setting of the cement, and by allowing the water with which the concrete is mixed to act on the cement for a longer period before the setting takes place it must tend to lessen the danger from free lime. Your correspondent "A. H." mentions 2 per cent. as the quantity of gypsum used, but this is the maximum amount allowed by the Standard Cement Specification, and I very much question if any cement manufacturer finds it necessary to use more than 1 per cent.: in most cases 0.5 per cent. is quite sufficient.

In order to meet the views of those engineers who are prejudiced against the use of gypsum a good many manufacturers

THE TIMBER TRADE.

London Market in July.

The stock of wood in the public docks on July 31st was—

	Pieces.
Foreign deals and ends - - -	1,550,000
Do. battens - - -	1,925,000
Pine deals and battens - - -	871,000
Spruce do. do. - - -	699,000
Boards, rough - - -	3,582,000
Do. prepared - - -	6,080,000

Totalling 14,707,000 pieces, as compared with 17,004,000 in 1904, 17,129,000 in 1903, and 20,439,000 in 1902.

In other kinds the stock was as follows:—

Foreign wainscot logs - - -	143 pieces.
Do. oak timber - - -	1,001 loads.
Do. fir timber - - -	634 do.
Do. Oregon pine, &c., spars and masts - - -	3,857 do.
Colonial oak timber - - -	1,301 loads.
Do. birch timber and planks - - -	3,040 do.
Do. elm and ash timber - - -	733 do.
Do. yellow pine - - -	726 do.
Do. red pine - - -	150 do.
United States pitch-pine timber - - -	15,265 do.
Do. do. deals - - -	40,000 pieces.
East India teak - - -	6,978 loads.

The deliveries for the first seven months have been of—

	Pieces.
Foreign deals and ends - - -	1,838,000
Do. battens - - -	3,464,000
Pine deals and battens - - -	642,000
Spruce do. do. - - -	882,000
Boards, rough - - -	3,204,000
Do. prepared - - -	9,041,000

Totalling 19,071,000 pieces, as compared with 20,826,000 in 1904, 22,367,000 in 1903, and 22,960,000 in 1902.

The deliveries for July

were as follows:—

	Pieces.
Foreign deals and ends - - -	250,000
Do. battens - - -	483,000
Pine deals and battens - - -	90,000
Spruce do. do. - - -	101,000
Boards, rough - - -	331,000
Do. prepared - - -	1,359,000

Totalling 2,614,000 pieces, as compared with 2,626,000 in 1904, 3,257,000 in 1903, and 2,982,000 in 1902.

Deliveries from Ship to Craft.

The deliveries direct from ship to craft for the first six months of the year have been:—

	1905.	1904.	1903.	1902.
	P.s.h.	P.s.h.	P.s.h.	P.s.h.
Deals and battens - - -	63,830	60,474	55,210	50,779
Boards - - -	13,282	10,975	13,606	14,168
Total - - -	77,112	71,449	68,816	64,947

and for July—

	P.s.h.	P.s.h.	P.s.h.	P.s.h.
Deals and battens - - -	30,203	27,309	20,272	19,909
Boards - - -	3,543	3,619	1,869	2,716
Total - - -	33,746	30,928	22,141	22,625

The above returns show a rather more satisfactory position as regards the total delivery from the docks and direct from ship to craft if taken together, although the results for the year so far show a deficiency of 6,000 standards compared to those for 1904, and 12,000 standards for 1903. There is no doubt that the condition of the building trade in and around London is responsible for a good deal of this shrinkage in the demand, but to this cause must be added the competition of other avenues of supply

outside London, which are restricting the area of delivery from that port to some extent year by year. No great progress has been possible during the month with free on board business except in retail quantities, owing partly to the fact that Swedish shippers are inclined to hold for rather more remunerative prices for autumn supplies, which buyers all over the country do not find the state of the demand warrant them in paying. On the whole the future looks slightly more hopeful, as stocks abroad are certainly not excessive, in the smaller sizes and floorings especially. Freight remain easy, and there is no scarcity of tonnage, but only a scarcity of demand for it.

Soft Woods.

Sweden.—Messrs Churchill & Sim state that battens continue to be sparingly imported, and prices are, on the whole, a little better. The demand for prepared boards, especially in the narrower sizes, has continued, with here and there an improvement in prices. Deals continue to be neglected, and any pressure to sell wholesale quantities results disastrously to the importers.

Norway.—The importation has been on a very light scale, and prices are a shade harder in consequence. A more hopeful feeling seems to exist in the producing countries as regards the future of the flooring market, which is reflected in the higher prices now being asked for autumn shipments, and in the absence of any large additions to the stock here during the month.

Russia.—There is no improvement in the demand for Russian deals in this market, and very low prices have had to be submitted to where large lines of stock have been in hand. Some little progress has been possible with the realisation of shippers' stocks for early autumn delivery, but only at the lowest current prices and for attractive specifications.

Finland.—Prices for battens are inclined to harden during the month owing to the light stock and the rather better demand for them.

Prussia.—There is no longer any wholesale demand for fir timber in London, but for special orders prices are quite firm.

Canada.—Although the supply of pine deals has been on a very small scale, prices do not seem to be affected to any extent, owing to the wretched state of the demand. Spruce has come forward rather more freely during July, but business continues difficult owing to the divergent views of sellers and buyers. Any improvement in the demand for spruce would quickly remove this barrier, but at present there is a feeling of indifference prevalent among buyers who believe that they will always be able to pick up what stock they require when it suits them to come into the market. In this they may be disappointed. The demand for sawn timber has been better—in the larger sizes especially. Quotations for forward delivery are quite firm and somewhat inclined to harden, and the stock here, even with some additions to it during July is in small compass. Deals have been imported to a smaller extent than usual and, with the stock very much reduced and expensive to replace, holders are expecting higher values.

Hardwoods.

Mahogany.—The arrivals last month were exceptionally light, and although the sales were not large the quantity sold was not replaced by fresh arrivals. The deliveries from the docks continue satisfactory and the stocks here are becoming seriously depleted. The demand at the auctions has been good, and prices generally have an upward tendency, which an improvement in trade would soon accelerate.

Queensbury's New Public Cemetery has been completed at a cost of £5,500. Mr. E. B. Drake was the architect.

ST. JACQUES LISIEUX. DRAWN BY ERNEST G. THEAKSTON.

IN PARLIAMENT.

(By Our Press Gallery Representative.)

The Cornwall Monument.

THE subject of the proposed removal of the Cornwall monument in Westminster Abbey and its re-erection in part in another place was again discussed in the House of Lords on August 1st.

Lord Hawkesbury and Earl Spencer renewed their protestations against interfering with the monument in the manner proposed, and Lord Ellenborough remarked that when he entered the Abbey his artistic sense was submerged by his historical recollections.

The Marquis of Lansdowne replying for the Government said his own impression was that the proposal of the Dean and Chapter dealt somewhat over severely with the Cornwall monument. It involved a complete disturbance of the principal parts of the monument, which was to be re-erected in a position where it would be impossible to decipher the inscription. He suggested that there should be some further discussion between those interested in the matter and the Dean and Chapter as to the manner in which the monument should be dealt with. He proposed that there should be a conference between Lord Hawkesbury, Lord Windsor (the First Commissioner of Works) the Dean of Westminster and perhaps one of the Cornwall family, when it might be possible to come to some wise decision. On this understanding Lord Hawkesbury withdrew the motion he had proposed, that the Cornwall Monument ought not to be removed without due notice being given to Parliament.

Poulduff Pier.

Mr. Long on July 27th informed Sir Thomas Esmonde that the contract for the construction of Poulduff Pier, in County Wexford, had not yet been signed. The Department were in communication with the contractor on the subject.

Cheap Cottages.

Mr. Noel Buxton asked the President of the Local Government Board whether in view of the favourable opinion held by competent authorities of the cheap cottages now being exhibited at the Garden City at Letchworth he would take into consideration the question of further modifying the model by-laws issued for the guidance of district councils.

Mr. Gerald Balfour replied that it was, he thought, desirable that in the first instance an officer of the Department should visit the exhibition and report on the subject, and arrangements were being made for this purpose.

Public Works in Ireland.

Mr. Long informed Mr. Dillon that the total amount of the substituted grant for school buildings in Ireland was £210,000 consisting of £140,000 to be voted by Parliament for public funds and £70,000 to be voted from the Ireland Development Grant. This amount would be spent in six years or more as might be arranged.

Mr. Long also stated in reply to Mr. Dillon that the amount proposed to be spent on the new residences for the students of the Marlborough Street Training College, Dublin, could not at present be stated. The new buildings when completed would provide accommodation for both male and female students, but tenders had as yet only been invited for the residence for the male King's scholars. As the terms for the contract had not been finally settled the amount of the tender could not be made public. The plans of the new buildings were submitted to and approved by the whole body of Commissioners.

Alterations at the House of Commons.

Lord Balcarras answering Mr. Renwick stated that the First Commissioner of Works

feared that structural difficulties would prevent the widening of the staircases leading from the Strangers' Smoke Room and the Terrace to the Lobbies of the House of Commons.

AN ECCENTRIC ARCHITECT.

Sir John Vanbrugh and his Work.

SIR JOHN VANBRUGH, the eminent but eccentric architect and dramatist, formed the subject of an interesting paper read by Mr. F. W. Nunn, of Lee, at a recent meeting of the Woolwich Antiquarian Society. Additional interest was lent to the paper by the fact that the meeting was held at Vanbrugh Castle, on Maze Hill, Greenwich, or as it was formerly called Bastille House, or the Bastille, it being said that it was built by Vanbrugh in resemblance of a portion of the Bastille, which was demolished in July, 1789, and in which Vanbrugh himself, when a young man, is said to have been once confined for about ten months. Mr. Nunn mentioned the fact that it was the custom in Vanbrugh's time for the architect to employ such workmen as he thought fitted for the job, to pay them himself, and call on his employers from time to time for money as it was required. As Vanbrugh was building this for himself he would naturally give it his best attention, and the other buildings close by, erected at the same time (A.D. 1717), doubtless grew up under Vanbrugh's immediate and continuous superintendence. Mr. Gilbert H. Lovegrove, in a prize essay to the Architectural Association, stated that Vanbrugh Castle was built of stock bricks, ornamented solely by key-stones, imposts, corbel-tables and string courses in projecting brickwork, the whole somewhat resembling a fortification, a conception carried still further by the crenelated or embattled wall which surrounds the garden and the turretted gateway. This picturesque old gateway, with its square turret on either side, was removed about a year ago for the purpose of widening the road, the frontage line being now set back. The staircase, as was frequent in Vanbrugh's designs, formed a prominent member of the main front, although it became as a consequence dark and inconvenient. By another staircase one reached the roof, from whence was obtained a beautiful view over London. Vanbrugh House, which stood on the opposite side of the road, a little to the left, and nearer Westcombe Park, was demolished about two years ago. It was an immense rectangular building, also of stock brick, with a circular tower at each end. Internally there was a long dark central passage opening into rooms on each side. The hearths were of marble, and the chimney-pieces were well carved in wood to simple designs.

The Mince Pie House, now known as Sherwood, still remains. It was one of the smallest of Vanbrugh's houses. The entire building is on the ground floor, and, beside containing several rooms of larger size and better proportions than the other houses, is much more comfortably planned.

Vanbrugh's Style.

Vanbrugh's style of architecture was only suitable to the largest of buildings, and was even then the occasion of much sarcasm and ridicule from the wits of his day; one of his buildings was likened to a dog-kennel, another to a pie, and a third to a coal scuttle, a flat candlestick, a piece of floorcloth, a snail, a chaise, a tilt in a boat, a house of cards, a mouse trap, and so on. This was doubtless the cause of the name Mince Pie House, just as the house which he erected from the ruins of the palace at Whitehall, in which he died in 1726, came to be known as "the Goose-Pie House" through Dean Swift, who seems to have observed it during

the course of its erection, as he wrote in derision:—

"At length they in the ruins spy
A thing resembling a goose pie."

That building thus obtained and retained the name of "The Goose-Pie House"; but in its declining days it was known as "the Pill-Box." Voltaire, who stayed three years in England, had knowledge of some of Vanbrugh's buildings, for he wrote that "They would be more comfortable if Vanbrugh had made the rooms as wide as the walls were thick." Sir Joshua Reynolds, the great portrait painter, was one of the few who appreciated Vanbrugh's originality of invention. He writes that "In the buildings of Vanbrugh there is a greater display of imagination than we find in any other, and this is the ground of the effect which we feel in many of his works." Had Vanbrugh received a more sound architectural education the probability is that his name would have occupied a more prominent position in the temple of fame.

His Chief Works.

The first notice of Vanbrugh as an architect was in 1701, when he furnished the design for Castle Howard for the Earl of Carlisle, who appeared to have been his first employer of note. Castle Howard, with its south facade 323ft. long, is said to be one of the finest examples of the Corinthian renaissance in England. The main building was not completed till 1714, but in 1704 the Earl of Carlisle, the then acting Earl Marshal of England, in appreciation of Vanbrugh's work, obtained for him the lucrative appointment of Clarenceux King-at-Arms. In 1703 Vanbrugh bought land in the Haymarket and built a theatre there called the Queen, in honour of Queen Anne. In 1702 Vanbrugh was appointed Comptroller of the Board of Works, which had as its surveyor general the great Sir Christopher Wren. In 1705 Vanbrugh was appointed architect and surveyor, by the Duke of Marlborough, of the palace it was proposed to erect at Woodstock in commemoration of the victory of Blenheim, which is probably the largest domestic building in England, with a frontage 348ft., a library 183ft. long and a hall 67ft. high. In 1716 he was appointed architect to Greenwich Hospital at a salary of £200 per annum, and he is said to have designed the centre of the more southern range of the west front (King William's block) in red brick with stone dressings, and some of the external decorations of the Painted Hall are attributed to him. Vanbrugh Castle, Vanbrugh House and the Mince Pie House, as we have seen, were built in 1717. Sir John's chief architectural works numbered some forty-two, all curious and many of them great massive buildings, many now disappeared.

Competitions.

The Competition Reform Society disapprove of the conditions of the competition for the town hall, &c., at Dartmouth (to which we drew attention in our issue for last week) and are endeavouring to obtain a revision of the same.

Consett Baptist Church and Schools.—The design submitted in a recent competition by Messrs. George Baines & Son, 5, Clement's Inn, Strand, London, for the new Baptist church and schools at Consett, co. Durham, has been adopted.

Mitchell Library, Glasgow.—The premiums have now been allotted to the architects who competed for the new Mitchell library at Glasgow but were unsuccessful in having their plans adopted. The first premium of £100 goes to Mr. Arthur, of Glasgow; £75 to Mr. Greenslade, of London; and £50 to Mr. Rhynd, of Glasgow.

Keystones.

Mr. James Miller, architect, Glasgow, is to submit plans for a new hydropathic at Peebles, to replace that burnt down.

Mile End Workhouse Extension was opened recently. Accommodation has been provided for 220 persons at a total cost of £12,396.

Mr. H. L. Mercer, architect, Ayr, has been appointed to complete the work of the South Parish Hall, Girvan, in place of the late Mr. Kerr.

Barking Baptist Tabernacle is being entirely remodelled internally, and galleries are being introduced. The contract is let to Messrs. Sands & Burley, of Walthamstow, at £1,744. Messrs. George Baines & Son, 5, Clement's Inn, Strand, W.C., are the architects.

Collapse of a Skyscraper.—The great stores at Albany (N.Y.) belonging to Messrs. Meyers suddenly collapsed on Tuesday last week and buried about 100 of the employees in the ruins. Framework, walls, stanchions—every portion of the skyscraper fell in utter ruin.

Change of Address.—Mr. Norman Evill has removed from 124, Regent Street, W. (office) and 39, Upper Gloucester Place, Dorset Square (private address) to 10, Davies Street, Berkeley Square (office and private address). His telephone number is 4182 Gerrard.

A new Railway Bridge at Norwich has been substituted for the old one spanning the River Yare. It is of double cantilever type, 122ft. long, with two viaduct spans, and will be electrically operated from a powerhouse on its centre. The new structure was placed in position in thirty-three hours.

The new Bridge over the Irwell between Manchester and Salford has cost £12,500. It consists of two Linville truss girders, each 18ft. deep and a little over 167ft. long. Each of the girders weighs about 140 tons and rests upon the old stone abutments. The total weight of the steelwork of the bridge is about 560 tons. The plans and estimates were prepared by the Manchester city surveyor, and the work has been carried out by Messrs. Morton & Co., of Garston.

An Infectious Diseases Hospital at Stricken was opened recently. It consists of five blocks and cost £17,000. The buildings are erected with rubble got in the vicinity, with dressings from New Pitsligo. Mr. Ironsides was the architect, and the contractors were:—Masons, George Cooper & Son, Boyndlie, Fraserburgh; carpenters, Edwards & Rae, Dyce; slaters, McIntosh & Connon, Peterhead; plasterers, James Scott & Son, Aberdeen; plumber, William Leask, Alford; painter and glazier, J. A. Ogilvie, New Pitsligo.

The Manchester Society of Architects paid a three days' visit from August 4th to 7th to study the charming stone buildings of the Cotswold district. Chipping Campden, probably the most interesting of a group of beautiful villages, was chosen for the headquarters, and provided ample material for study. Unfortunately, heavy rain restricted the choice of subjects for sketching to those where some shelter could be obtained; this made the sedilia in the church particularly valuable, while the quaint market hall afforded a refuge from the rain with a picturesque outlook. The workshops of the guild of handicraft were examined with interest. Sunday, the one fine day, was pleasantly spent in walking to Broadway, almost equal to Campden in its wealth of architectural interest. The Society has also made visits to Messrs. De Bergue & Co.'s ironworks and to the new Manchester fire-station (Messrs. Woodhouse, Willoughby & Langham, architects).

An Isolation Hospital at Preston is being erected at a cost of £20,000. Provision will be made for fifty-six beds.

The Tower of St. Mary's Church, Oatlands Park, has now been completed, the work having occupied nearly eighteen months. It was carried out by Messrs. Goddard, of Farnham and Dorking, from the designs of Mr. J. Compton Hall, F.R.I.B.A.

A Memorial Mission Church at St. Ives has been erected from designs by Mr. E. Sedding, of Plymouth, at a cost of about £1,600. It is 89ft. long, the nave being 25ft. wide. Granite has been used throughout, with ashlar stonework from the Polyphant quarries, near Launceston.

Mr. A. B. Skinner has been appointed Director of the Art Museum at South Kensington, to succeed Sir Caspar Purdon Clarke. Mr. Skinner has been a member of the staff of the Victoria and Albert Museum since 1879, and assistant director of the Art Museum since June, 1896.

Open-air Public Baths at St. Albans have been provided. The city surveyor prepared the plans, and the work was carried out by Mr. J. T. Bushell at a cost of £1,275. The swimming bath is 105ft. by 30ft. with a depth of 6ft. at one end and 3ft. 6ins. at the other. It is constructed of Portland cement concrete, walls 2ft. thick and the bottom 1ft. thick, the whole being rendered in cement and finished smooth. The footpaths around the bath, 10ft. wide at the sides and 12ft. at each end, are laid with Imperial stone flags, the whole being surrounded with a 14in. brick wall 8ft. high.

Alterations at Winchester College are to be made, including the conversion of the college brewery into an adjunct of the warden's lodgings. Writing to the "Times" in reference to the proposal, "A Wykehamist" says: "The characteristic of Wykeham's buildings at Winchester which has most impressed those who have critically examined them, or have lived in them and loved them, is not their beauty of detail; it is rather the sincerity and austere dignity of their design, and the perfect arrangement of their ensemble. Wykeham had no idea of treating meanly, or of hiding from view, what was practical, workaday, domestic; the offices of his college were placed, plain and effective, in his 'outer court,' through which all who entered the college passed. What we consider the uncomely parts of an establishment and conceal he forces on our notice, and we recognize their abundant comeliness. It appears that the governing body of the college has determined to alter the whole character of this outer court. The brewery, which occupies its north side, is to be turned into an adjunct of the warden's lodgings, and provided, I presume, with ornate windows and such other embellishments as a clever modern architect may devise. The need for additional accommodation may conceivably be so pressing as to justify all this; but the office of resident warden has recently been abolished; and *prima facie* the need for accommodation has diminished."

Obituary.

Mr. George C. Porter, aged 55 years, master-builder, of Hornsey, committed suicide recently by taking carbolic acid.

Mr. William Allan, retired builder, of 34, West High Street, Inverurie, died recently, aged 68 years. An architect of considerable standing, the deceased was very frequently employed in this capacity, and many of the best buildings in Inverurie and neighbourhood remain as evidence of his ability and worth.

Builders' Notes.

The Venezuelan Federal Court has decided to annul the charter of the Bermudex Asphalt Co.

The Holmes Chapel Schools have been supplied by Messrs. E. H. Shorland & Brother, of Manchester, with their patent Manchester stoves.

Rural By-Laws: An Alteration.—The Cuckfield (Sussex) District Council has decided to alter its by-laws so as to allow of the building of rural cottages similar to those exhibited at Letchworth Garden City.

At a Master-Builders' Banquet at Pretoria recently Mr. Ashdowne made the remarkable assertion that the coolie trader in Pretoria can buy his material at a lower cost and obtain a longer credit than the white man.

Change of Address.—Messrs. Burn Brothers, manufacturers and patentees of sanitary specialities, have removed from 23 and 24, Charing Cross, Whitehall, London, W., to their new offices and works at 3, Blackfriars Road, S.E.

Messrs. G. & A. Brown, Ltd., of 167, Hammersmith Road, London, have opened a West-End showroom, for the use of architects and others, at 85, Newman Street, Oxford Street, W., where they are showing plaster ceilings, cornices, friezes, chimney-pieces, wall-panelling, mouldings, composition and Carton-Pierre ornaments, &c.

Taxing White Lead Imported into Canada.—One of the Canadian Budget proposals is to raise the tariff on dry white lead from 5 per cent. to 30 per cent., in the interests of British Columbian leadminers and Montreal producers of this commodity. No doubt the tax will have its effect on the price of paint throughout the Dominion, and it may conceivably do something to stimulate the consumption of lead substitutes. Linseed oil, the other great staple of the industry, is made unnaturally dear in Canada by an impost of 25 per cent. Even this does not wholly shut out English competition, and a faint hope may be indulged that the new restriction will be similarly ineffectual.

Careless Foremen make Careless Workmen.—At the Paddington Coroner's Court recently Mr. W. Schroeder spent nearly two hours investigating the death of a stonemason named John Langdon, aged 55, employed by Messrs. Holloway Brothers, contractors and builders, who fell 50ft. from a scaffold at Hanover House, a block of flats in course of erection in High Street, St. John's Wood. At the place where the deceased fell the guard-boards had been removed the day previous in order that some scaffold poles might be lowered, and they had not been replaced because the work on that "ledger" had been finished or nearly so. The foreman in charge, Thomas Hosken, admitted that he had pointed out to the deceased a small joint which needed pointing, but it was 20ft. away from the spot where deceased fell, and he did not know why the deceased mixed his mortar there unless it was that a box convenient for mixing happened to be standing just where the guard-boards had been removed. During his evidence this witness spoke of the carelessness of workmen, and the Home Office inspector, who was watching the enquiry, asked, "Careless foremen make careless workmen, don't you think?" Witness hoped he had not been careless. The Inspector: "You are throwing a reflection on this dead man, and I want to know whether his carelessness was any more than yours? You saw him working in this dangerous spot and gave him no warning." The jury returned a verdict of "accidental death," adding that they were of opinion that the accident would not have occurred if the guard-boards had not been taken away.

IONA CATHEDRAL.

Criticisms of the Restoration Scheme.

SOME lengthy letters have appeared in the Scottish press with reference to the methods employed in the restoration of Iona Cathedral, which we dealt with in an article in our issue for July 27th, 1904, since when another architect has been appointed. The scheme is generally condemned by Mr. A. C. Champneys (the author of the article on "Irish Ecclesiastical Architecture" in the current number of the "Architectural Review"), who writes:—

"The roof of the south transept on the outside is, comparatively speaking, satisfactory; but the rest of the building is covered with slates of commercial appearance and unpleasant colour. The best hope for this roofing seems to be that the ravages of the winter gales may give an opening for its complete removal. The walls of the church were, like other rough masonry, plastered inside. In the larger part of the building this has now been removed, according to the mistaken—and, one had hoped, now nearly obsolete—idea that the mediæval architect liked to display the skeleton of his building, instead of covering it up decently, on the inside at all events. If it could be contended that the plaster was here first added after the Reformation, the walls of the nave and of the cloisters, which were certainly not then 'restored,' would be enough to refute this singular notion about a Gothic building.

"The choir certainly once had a flat internal roof or ceiling, as the corbels and the plaster show. There was doubtless a room above it. The present timber roof, of an uninteresting kind, is open to the top, ignoring the old arrangement, and new corbels have been inserted to carry it, leaving the old ones useless, except as witnesses to the falsity of the 'restoration.' The north transept has been provided with a similar roof, though here, too, the corbels indicate a flat ceiling, and this point is made certain by the presence of a door, which now overhangs vacancy, but once led into the tower from a room above the transept, which, again, was obviously connected with the upper floor of the domestic buildings—the sort of arrangement which is sometimes found in Scotland, and is common in Ireland. This transept has been a special sufferer at the hands of the 'restorer.' In the rebuilding of its northern face, which had been broken away, a commonplace Gothic rose window has been inserted, opening on the inside through an arch supported on Romanesque pillars. Those who completed the cathedral (as it stood until recently) were eclectic, but not quite after this fashion. On the outside the window would have opened into the upper storey of the domestic buildings—this is absolutely clear and unmistakable.

"A Travesty of Restoration."

"The treatment of the north transept has been deplorable; that of the north choir aisle or sacristy is not less unfortunate. Those who saw the building while it was, though roofless, comparatively uninjured, bearing traces of all the stages in its history, will remember that this sacristy had been walled up, and that a beautiful late mediæval doorway had been inserted in the wall. The upper part of this partition has now been removed, and the lower part has above the doorway been cut and adapted into an ugly and ponderous new pediment. This is terminated on one side by a grotesque animal of considerable size, and on the other by a large angel, of very modern and mawkish character—an appalling contrast to the interesting and spirited carving on the old capitals of the south aisle opposite. A place stands reserved at the top of the pediment, I understand, for an image of St. Columba; but I do not know whether this is to be by the same sculptor as that of the angel.

"This certainly does not exhaust all the criticisms that would be justified. And one cannot help asking whether nothing can be done to reverse, or at least to stop, this spoiling and falsification of a building over which morally (though, unfortunately, not legally) the Scottish public has some rights. Besides subscriptions for the restoration of the building being invited by a board at the entrance to the enclosure, attention is called in a notice on the steamer 'to the urgent need of funds to complete the roofing of the ruins and to meet the cost of upkeep in the future'—not for experiments in twentieth century architecture. This notice at least should in fairness be altered.

"Anyone would, of course, wish such a building to be preserved. But it would be a less ignoble fate for it to perish than to be spoilt by such a travesty of restoration. As regards its use for divine service, the feelings which it is now calculated to inspire are most undevotional and un-Christian."

The Architect's Reply.

Mr. J. Honeyman, of Glasgow, the architect who is carrying out the restoration, in the course of a reply to the above charges says:—

"Mr. Champneys mentions only one instance in which old work has been interfered with; and it so happens that he could not have suggested a better illustration of the folly of the course he recommends. I refer to the destruction of fragmentary remains of plaster. Only a very small portion of this possessed any value, but that would have been saved if there had been a resident clerk of works at the church. But there was not—and why? Simply because the trustees were only in a position to spend three or four hundred pounds in the course of the season instead of as many thousands. The risk of a workman making a mistake is almost as great in the one case as in the other, but no one would advise that when the few hundred pounds available are being spent, chiefly in repairs to secure the safety of the building, an additional expense of three or four guineas per week should be incurred to keep a clerk of works there practically idle. The whole work is being carried on at great disadvantage owing to the inadequate support the trustees have hitherto received; and the obvious intention of your correspondent is to perpetuate this state of things.

"His remarks regarding the slating are hardly intelligible. He thinks the slating of the south transept tolerably satisfactory, but the slating of the choir as bad as can be; while both of these roofs are covered with slates of exactly the same description and quality as those which he so unreservedly condemns. The roofs, I may say (with the exception of that of the north transept), were constructed and slated before I was asked to advise the trustees. The kind of slate selected was those which I have no doubt were on the building; but when roofing the north transept I took care to get the heaviest slates of the kind which the quarries could supply.

The North Transept.

"Now, as to the deplorable restoration of this transept. If Mr. Champneys had been better informed he would have recognised that there is no restoration at all, nor any attempt at restoration. Part of the east wall was in imminent danger of falling, and that was most skilfully repaired by a contractor of immense experience in work of the kind. But the gable is in no sense a restoration; it is a new design, adapted to altered conditions, yet harmonising generally with its surroundings, and so far as the effect of the wheel window is concerned, while Mr. Champneys is quite entitled to hold his opinion, I am—still more, I think—entitled to hold mine. He is also quite welcome to exhibit his ignorance by suggesting an alternative treatment which is impracticable, and which

would leave the north gable without any window where light is now so much needed.

"Regarding the restoration of the arcade on the north side of the choir, Mr. Champneys says not one word to justify his supercilious remarks. The restoration of the lower order of these arches was absolutely necessary to admit of the removal of the rubble beneath them; but the original design was preserved with the greatest care, and the effect of the opening up of these arches is most satisfactory in every respect. The only thing here which the critic condescends to specialise is a comparatively insignificant piece of work which makes no pretence of being a restoration, but is merely designed to meet new conditions.

"The beautiful old door is left untouched, but if its masonry had been examined more carefully by Mr. Champneys he would have seen that unless a piece of vertical wall-face had been left above it, this would not have been the case; and also that there were other reasons for leaving some wall there. Perhaps he can devise some other treatment which would better fulfil these conditions, and at the same time relieve the central column down to the plinth of its base. He might also be good enough to state how it would be possible to minimise this pediment—which he styles 'ponderous'—consistently with ordinary Gothic precedents.

The Treatment of the Carving.

"As to the treatment of the carving, there is perhaps some room for difference of opinion. For my part, I have no sympathy with those who advocate the introduction of sham antiques. In this matter I am guided by the principle which invariably guided mediæval architects. Unless this principle had been respected during the Middle Ages we could have had no such thing as comparative architecture now. Had the architect of this old door not adhered to this principle when he inserted it in a wall some centuries older we would have lost much insight into the history of the building. In the same way new work, introduced into the building for the first time now, may, if done after the manner of the time, carry some truthful message down to future ages. The sham archaic can only mislead.

"I cannot ask you to allow me space to deal more in detail with your correspondent's absurd statements and unwarrantable assumptions. I will only add that for much of the work commented on I am not responsible, but I am not disposed to admit that Mr. Champneys has any right to speak of it as he does, and still less to pose as an expert in connection with work which he evidently does not understand. With the exception of the few patches of rotten plaster still adhering to the wall after several centuries of exposure in the stormy climate of Iona, which have already been referred to, Mr. Champneys cannot point to a single instance where old work has been destroyed. The trustees are strictly conservative in their ideas. Their object is much more to preserve than to restore, and to restore not for its own sake, but as a means to that end, and that they may be in a position to protect not merely the precious buildings themselves, but many of the beautiful and priceless crosses and sculptured slabs entrusted to their care. There is not the slightest excuse for the ungentlemanly insinuation that they or their advisers mean to do otherwise. I trust that the result of Mr. Champneys' premature and unjustifiable interference will be different from what he expected, and that it will create a reaction in favour of the vigorous prosecution of the undertaking."

Mr. Champneys' Retort.

In reply to this letter of Mr. Honeyman Mr. Champneys writes: "I shall not comment on the expressions that he uses further than to say that the free use in controversy of words like 'absurd,' 'ignorant,' and so on,

is not usually considered to show a strong case or to add to any strength which a case may possess. And the question, after all, is not whether I am an 'expert,' but whether the statements in my letter were true. I do not quite follow his statement about the slating; it seems to suffer from some clerical error. If he means to say that the slates of the south transept are not (whether accidentally or otherwise) of a different colour and appearance from those of the choir, I think that the general verdict of persons not colour-blind will be against him.

"One principal charge which I brought against the restoration (as it is called) is that the building has been falsified by the erection of internal roofs different from those which were originally there. I do not gather that Mr. Honeyman denies this. As to the plaster, I do not understand what was the particular value which he attributes to certain bits of it. The question, I should have thought, is whether the cathedral had been plastered inside or not. Like other similar mediæval work, it certainly was. I do not understand that Mr. Honeyman denies this. Now most of it has been scraped. However, the loss of certain fragmentary remains of plaster possessing value was, it appears, due to the absence of any adequate supervision of work done on an ancient building of immense interest, owing to deficiency of funds. (The distrust on the part of the public which led to this deficiency seems to me to have been fully justified.) But were the trustees bound to finish the building, including its ornamental details, in two or three years, with inadequate funds? Might not, for instance, the pulling-down of the wall shutting off the sacristy have been at least deferred—such party-walls being not uncommon in mediæval churches—and with it the pediment and the angel? This would not have endangered the safety of the building. After all, the general appearance of the walls and the form of the roofing are rather considerable points in a church. I said that the building had been falsified, and this, to the large extent stated above, Mr. Honeyman apparently does not deny.

"I also expressed the widespread opinion that the cathedral had been spoilt by incongruous and ugly work. As regards the north transept, though 'the trustees are strictly conservative in their ideas,' and though subscriptions are asked for restoration, it appears that the Gothic rose-window in a Romanesque arch is not intended for a restoration. Of course, I never thought that it really was one; the word should perhaps have been in inverted commas, but it is often loosely used; certain notorious new work in St. Albans Abbey is sometimes thus spoken of. However, the window and the carving about the pediment are now said—by Mr. Honeyman—to be valuable as original work. The latter may, 'if done after the manner of the time, carry some truthful message down to future ages.' If the angel remains, I agree that it is not likely to be mistaken for mediæval work. But is not this claim by an individual architect to inaugurate a new architecture at the present day a somewhat bold one, and could not the new art be more safely experimented with in new buildings? And while sculpture (in the new style) is being completed, most of 'the beautiful and priceless crosses and sculptured slabs' are being left exposed to the weather in and near St. Oran's Chapel.

"Mr. Honeyman is well satisfied with the newest work at Iona. No doubt he is, or he would presumably not have designed it, but he can hardly expect to be regarded at the same time as an impartial judge of it. And in general he cannot have it both ways. He cannot restore (in any real sense) and at the same time introduce into an ancient church features and designs which could not possibly have existed there. The trustees cannot be

'strictly conservative in their ideas' and at the same time spend money on twentieth-century architecture. And whether it is that the new art makes the old seem poor, or (as I rather think the verdict will be) that the new is in painful contrast to the old, at all events the two are wholly incongruous."

Law Cases.

A Building Line Dispute.—In the King's Bench Division recently Mr. Justice Phillimore heard the case of *Dowsett v. Ramuz*, in which the plaintiff prayed for an injunction restraining the defendant from building in Victoria Avenue, Southend-on-Sea, beyond the building line mentioned in an indenture of conveyance of October 26th, 1878, in breach of covenants' stipulations in that behalf therein contained. It appeared from the affidavit sworn by the plaintiff that on October 26th, 1878, certain property, part of the Milton Hall estate in Southend-on-Sea, was conveyed to one Hudson; that by that deed the purchaser covenanted that no buildings should be erected on the land thereby conveyed between the building line 35ft. from the road and the roadway shown on the plan, except fences; that Hudson shortly after erected a private dwelling-house, called Eton House, upon the land purchased, the main part of which stood back 35ft. 6ins. on each side of the bays, and the bays 32ft. 5ins., from the said road; that in 1881 the plaintiff built Roynce villa on the adjoining piece of land, the frontage being the same distance from the road; that it was customary at Southend to allow owners to bring forward their bay windows slightly beyond the stipulated building line; that the defendant in 1904 became the purchaser of Eton House and purported to convert the house on the ground floor into shops, and for that purpose deposited plans, which were duly passed, showing that the building line of his house would be brought forward to 32ft. 4½ins. from the road; that this would be prejudicial, not only to the owner of Roynce Villa, but also to all the other purchasers, who had bought on the same conditions. The defendant, in his answer, affirmed that the plaintiff's house and the two houses adjacent had bay windows projecting 3ft. beyond the building line; that since the time of the erection of Eton House and Roynce Villa the character of the locality had changed from residential houses to shops.—Mr. Justice Phillimore said that both the plaintiff and defendant had been equal sinners. Upon the whole, he thought it was not only an excess, but so great an excess, that it ought to be restrained. He was justified in that by two considerations—(1) the defendant began the breach; and (2) it was a practice in Southend to allow bay windows beyond the building line; therefore, the infringement by bay windows was trivial, and therefore he thought the plaintiff was entitled to an injunction restraining the defendant from building as shown in the plans deposited by him with the town council and passed by them.

The Right to acquire Property.—The case of *Pescod v. the Mayor, &c. of the City of Westminster* was heard recently by Mr. Justice Eady. The plaintiff, a tailor, of 30, Piccadilly, sought an injunction to restrain the defendants from acting upon a notice to treat with him for the compulsory acquisition of his interest in those premises, which they wanted for their scheme of widening Piccadilly. The action raised the question whether the defendants had the right to give notice to take the whole of the premises when all that was necessary was a strip 22ft. wide. Mr. Pescod's complaint was that the notice was given not because the whole of the premises were required for the actual widen-

ing, but for the purpose of enabling the Council to carry out a contract it had entered into with a private company, which was to erect an hotel. The defendants contended that the work to be executed by them could not be done while the plaintiff was in occupation of any portion of his premises. Mr. Justice Swinfen Eady, in delivering judgment, said in his opinion the plaintiff had not any absolute right to prevent the defendants from taking more land than they intended actually to dedicate to the public. He thought they had *bonâ-fide* adjudged that the whole house was essential to the widening they proposed, and he dismissed the action with costs.

Damages for Libel.—At Leeds Assizes on Thursday Messrs. Dickenson & Son, a local firm of builders, were awarded £100 damages against the Bradford and County Constitutional Press Co. (Ltd.), late proprietors of the "Daily Argus," published at Bradford. The libel was in respect of two letters which had appeared in the "Argus," a term having been used which was understood to mean that they were jerry-builders.

An Asylum Contract.—At the recent Kent Assize Mr. Justice Bray heard the case of *Wise v. The Asylum Committee of Canterbury and W. J. Jennings, architect*. It was a claim for money due from the Corporation of Canterbury in respect of certain buildings which the plaintiffs had erected, and for damages against the architect for failing to certify the proper amount due at the proper time. Plaintiffs erected certain asylum buildings, the contract price for which was £12,950. The work was finished in March, 1901, and the plaintiffs applied to the architect for the final certificate, but (according to counsel) he refused this. When afterwards called upon for explanation he said that the work was unfinished, and then went on to say that the work unfinished was that which he had himself ordered to be omitted from the contract. The plaintiffs went back and did this work, which cost over £2,000, and the defendant had refused to pay them a penny for this. When they demanded a certificate for the work done, so that they might get half of the amount which they were entitled to by the retention, they were refused and told that they had been overpaid. After considerable argument it was announced that the plaintiffs consented to judgment for the defendants with costs, and also withdrew every imputation that had been made against Mr. Jennings. The question of the amount due under the contract it was agreed should be referred to a person to be named by the Royal Institute of British Architects.

"Reckless Charges."—In the Court of Appeal recently the case of *Roberts and another v. Stythe* was heard. The plaintiffs, who are builders carrying on business at Llandudno, brought the action against the defendant, Mr. R. R. Stythe, of Carnarvon, to recover £416 under a building contract. Mr. Justice Bucknill made an order staying the action and referring the dispute to the architect named in the contract, Mr. Rowland Lloyd Jones. The plaintiffs appealed against this order, contending that he was not a fit and proper person to determine the dispute. It was alleged that, under the threat of an action for negligence being brought against him by the defendant, the architect had sanctioned certain deductions, and that, therefore, his mind was biased. The architect denied that he had ever been threatened by the defendant, and stated that the deductions which he made from the plaintiffs' claim were made on his own judgment and quite independently of the defendant. In giving judgment the Master of the Rolls said that the plaintiffs, having deliberately elected by the contract to refer all disputes to the architect, had sought to get rid of him

by throwing mud at him and making aspersions against his character. A more reckless charge he (the Master of the Rolls) had never seen upon an affidavit, because for the allegations made it was clear there was not the slightest foundation. There was no ground shown justifying this appeal, and it must be dismissed with costs.

An Insecure Coal-plate.—At the recent West Riding Summer Assize an action was brought by Miss Ella Reinhartz, a sanitary inspector in the employ of the Leeds Corporation, for damages for personal injuries against Messrs. J. W. & H. Collinson. According to the plaintiff's statement she was walking down Park Square, in Leeds, on the morning of December 22nd last, and put her foot on a round iron plate which covered the mouth of a coal shoot at No. 24, Park Square, which were premises leased by the defendants. The plate was not properly secured, for the plaintiff's foot caused the plate to tilt up at one end and her leg slipped down the aperture. She was somewhat severely injured, and it was discovered that she was suffering from rupture. For the defence it was contended that the real cause of the accident was the falling away of the brickwork which supported a crossbar which held the fastening of the plate. The judge, in summing up, said that the action was of some importance, because it was one of those cases where a tenant might be legally, although not morally, responsible, but it was clear that responsibility must be fixed upon somebody. The defence was that the structure of the plate was bad, and if it were so it was their duty to point it out to the landlord. In this instance the responsibility of the tenants was lessened by the fact that they had not entered into actual possession of the premises at the time of the accident. The jury returned a verdict for the plaintiff for £140, with costs, but they were unable to agree as to whether the plate was an outside or an inside repair.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Cotton Spinning Mills.

ROCHDALE.—AN OLD READER AND WELL-WISHER writes: "On p. 83 of your issue for August 9th, I notice you have an enquiry relating to 'Cotton Spinning Mills,' which is not answered satisfactorily. The book you should recommend is a new one issued by Mr. John Heywood, Deansgate and Ridgefield, Manchester, and 29 and 30, Shoe Lane, London, E.C. It is called 'Recent Cotton Mill Construction and Engineering,' by Mr. Joseph Nasmith. The price is 4s. 6d. nett."

South Kensington Building Construction Examination.

CHORLEY.—STUDENT writes: "Do you intend to publish the answers to building construction, stage I. and II, this year?"

No, not this year.

Weight of Ceiling.

SUNBURY-ON-THAMES.—E. H. writes: "I am very much interested in the reply to 'H. G. V. O.' in your issue for July 26th, which I follow clearly but do not quite understand how the reactions are arrived at, as the total weight of ceiling is 4,100 lbs., and it would seem that one-half, or 2,050 lbs., should be on each support. I see how the load at joint G H B (775 lbs.) is arrived at,

but should like to know why the load on the joint G A F is not given."

The load 1,575 represents the line A C in the stress diagram, and is the resultant force acting at the point of support for the truss. The total reaction is 1,575 lbs. plus half the load on the member A—G, but the latter load has no influence on the stresses in the truss, and has therefore been omitted in order to simplify the diagram. S. N.

Valuing Architect and Surveyor's Business.

WATFORD.—SEPIA writes: "How is the value of a partnership in an architect and surveyor's business determined?"

Three years' purchase is usually taken as the value.

Terazzo Floors.

GLASGOW.—MOZAIC writes: "What is the proper composition in quantities of marble and cement for terazzo floors? Please name a book on the subject."

See the "Marble Mason and Mosaic Worker" section in "Specification, No. 8," published from our offices, price 2s. 6d. or 3s. 3d. post free.

Competition for the Palace of Peace.

BOURNEMOUTH.—G. A. B. L. writes: "Where can I obtain particulars of the competition for the proposed Palace of Peace at the Hague?"

Competitors may obtain particulars and information from Mr. D. E. C. Knuttel, architect, 16, Fluweelen Burgwal, The Hague, Holland. The full conditions, with plan and a view of the site, will be published in "The Architectural Review" for September.

Efflorescence on Tiles.

KING'S LYNN.—W. H. writes: "We had a new tile floor put down in a showroom last January and have been troubled with a white growth through the tiles ever since, more especially on cold days; in fact, the colder the weather the worse is the growth. Our builder says it will disappear in time, but it still remains, and is a great eyesore. How can the nuisance be overcome?"

We presume the trouble is efflorescence, and should suppose it to come from the cement in which the tiles were fixed. If this is so it would make its appearance most when the floor is drying after being wetted. We do not see how it can be stopped; it will wear out in time.

Unfair Charges by Architect.

GLASGOW.—G. G. writes: "After commencing business and carrying out several minor contracts, we were successful in securing through an architect a contract of a much larger amount. In appreciation of his kindness we endeavoured to find several clients for him, and in one instance we were successful in doing this. Later, having a dispute with one of our sub-contractors on this job, he was good enough to lend our agents a detailed plan and also to look up one or two letters. In each instance the time occupied in so doing would not exceed ten minutes. He now presents an account for professional services exceeding that charged by our agents, who carried the whole case through the court. (1) What is your opinion of his action? (2) Are we liable?"

If the facts are as you state, we think the architect's action is sharp practice, and that he should not have made any charge, but in any case he is only entitled to charge for the time occupied by him in looking out the letters and details.

The west front of the Priory Church, Dunstable, is being restored. Mr. G. F. Bodley, R.A., is superintending the work, which will cost £5,000.

These cottages have been erected at a cost of £350, complete, from designs by Mr. Lionel U. Grace, architect, of 30, John Street, Bedford Row, W.C.

Complete List of Contracts Open.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
BUILDING :

CARRON COMPANY'S

New Art Mantel Registers.

Unsurpassed in Design and Finish.

Illustration shows No. 547 Mantel Register Grate—a very handsome modern design. It has hinged adjustable and removable canopy, removable horizontal bars, slow combustion fret with brass knob, double shelf, sectional Teale brick back.

Prices and Particulars on application.

Carron Company manufacture Grates of every description—in sizes and styles to suit all requirements.

Works: CARRON, Stirlingshire, N.B.

AGENCIES AND SHOWROOMS:

LONDON (City)—15, Upper Thames Street, E.C.; (West End)—23, Princes Street, Cavendish Square, W.; LIVERPOOL—30, Red Cross Street; MANCHESTER—24, Brazennose Street; BRISTOL—10, Victoria Street; NEWCASTLE-ON-TYNE—13, Prudhoe Street; GLASGOW—125, Buchanan Street; BIRMINGHAM—Guildhall Buildings, Stephenson Street; DUBLIN—44, Grafton Street; SOUTHAMPTON—Town Quay (The Old French Prison).

Electrical Notes.

Lamp Filaments.

Experiments have been made in the manufacture of carbon filaments by Mr. J. W. Howell, who claims to have produced a carbon filament possessing new and important features, both scientific and commercial.

The methods employed by Mr. Howell in obtaining these results were recently explained in a paper read by him before the American Institute of Electrical Engineers, and may be summarized under the title of high-temperature baking or firing, the agent employed to effect the purpose being an electric furnace of the incandescent type, consisting of a carbon tube (having water-cooled copper connections) into which are passed cylindrical carbon boxes packed with filaments. To prevent combustion the tube is embedded in powdered carbon.

It is a well-known fact that a carbon filament heated to exceptional temperatures by a current in an exhausted bulb derives no benefit from the treatment, but it is otherwise when the filament is heated by external means to the highest attainable temperature at atmospheric pressures. The special point established in the paper in question is the markedly different effect which is produced when a so-called "treated" filament is "fired" by subjecting it to high temperatures in the electric furnace, as distinguished from the effect produced when a base filament, made from the usual squirted cellulose thread, is so subjected. By a treated filament is, of course, meant one which has been heated electrically in hydro-carbon to produce an additional coat of carbon. The ordinary base filament, whilst improved in some respects by the firing process, undergoes no very marked change in resistance. As the temperature rises the resistance falls, but at different rates.

It is otherwise, however, with the fired treated filament. The resistance in this case becomes not only greatly reduced when cold, but is actually reversed as the temperature is increased, and rises, in fact, as with ordinary metals. By reason of this property the term "metallized filament" has been given to filaments which have undergone this treatment. The resistance of a fired treated filament depends upon the relative thickness of the base and of the deposited coat, and upon the temperature of the firing.

Metallized filaments blacken the lamp bulbs much less than ordinary filaments, a point of considerable economic importance. This may be due to the elimination of mineral and other matters from the base filament. What is of still greater commercial importance is the fact that metallized filaments are more stable at high temperatures; they give, it is claimed, a useful life of 500 hours' run at 2½ watts per c.p., as compared with a similar life with lamps of the best ordinary type run at 3½ watts per c.p. Further, owing to the rise that occurs in resistance as the temperature increases, the lamps should be especially well suited for use on circuits of varying pressure.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

DURING THE WEEKS ending August 4th twenty-three and August 11th twenty-two failures in the building and timber trades in England and Wales were gazetted.

G. BUXTON, builder, Wimbledon. R.O. Aug. 3rd.
J. THOMPSON, builder, Leeds. Liabilities £443; assets £270.

E. J. HASLOP, builder, Norwood Side, March. P.E., Peterborough Law Courts, Sept. 15th, at 12.
E. BROWN, builder, Easton, Bristol. P.E., Guildhall, Bristol, Sept. 29th, at 12.

C. B. LIXTON, architect and surveyor, Clifton and Bristol. P.E., Bristol Guildhall, Sept. 29th, at 12.

G. APPS, builder, Hayling Island. Adjourned Exam., Portsmouth C.C., Aug. 28th, at 11.

J. HUXTABLE, builder, late Bournemouth and Upper Parkstone. P.E., Poole Town Hall, Oct. 4th, at 10.30.

C. BUTLER, builder, Bow and Leigh-on-Sea. Adj. Aug. 1st.

W. A. FISHER, plumber and glazier, Norwich. P.E., Norwich Shirehall, Oct. 25th, at 11.

T. KELL, bricklayer, late builder, South Shields. P.E., Newcastle-on-Tyne C.C., Aug. 24th, at 11.

G. A. SHAND, plasterer, Halton (late Hastings). R.O. Aug. 4th.

F. HODGES, builder, Isleworth and Ealing. Gross liabilities £11,837; assets £2,859.

FLEW & Co., builders, West Kensington. Liabilities £5,709; estimated assets £29,910.

M. T. RODWELL, plumber, North Evington. Liabilities £197; assets £92.

J. G. SMITH, builder, Colchester. First meeting, Cups Hotel, Colchester, Aug. 17th, at 11.30. P.E., Colchester Town Hall, Sept. 15th, at 11.30.

A. COOK, bricklayer and builder, Harleston. First meeting, O.R.'s, Ipswich, Aug. 18th, at 2.30. P.E., Norwich Shirehall, same day, at 10.30.

POWELL BROTHERS, stained-glass artists and church decorators, Leeds. First meeting, O.R.'s, Leeds, Aug. 17th, at 11.30. P.E., Leeds C.C., Sept. 4th, at 11.

B. NIGHTINGALE, builder, &c., New Cleethorpes. Gross liabilities £11,243; £452 expected to rank; estimated surplus £1,747.

New Companies.

HOWARD & SHANKLAND, LTD., factors of wallpapers, brushes, &c. Capital: £8,000.

HICKS & SYNDICATE, LTD., builders, contractors, &c., 19, Lincoln's Inn Fields, W.C. Capital: £20,000.

MORRIS & Co., LTD., decorators, 449, Oxford Street, W. Capital: £45,000.

CAVITY VENTILATING BUILDING BLOCK SYNDICATE, LTD., to acquire the invention and rights of J. G. Stüder for the United Kingdom, France, Belgium, Cape Colony, Orange River Colony, Natal and the Transvaal in his patent cavity ventilating hydraulic compressed building blocks and his invention and rights for the United Kingdom for improved glazed brick partitions. Capital: £16,000.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, Great New Street, Fetter Lane, E.C. Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Barnes.—For the erection of a cemetery chapel and keeper's lodge, for the Urban District Council. Mr. Reginald B. Rowell, A.R.I.B.A., M.S.A., architect, Triangle Corner, East Sheen S.W., and at 1, Nassau Road, Barnes. Quantities by the architect:—

F. Mark, 51, Bell Street, Edgware Road...	£2,937
W. Hyde, 148, Birchanger Road, Norwood Junction...	2,896
The Sycamore Works, Wimbledon...	2,830
G. Wimpey & Co., Hammersmith...	2,810
Dean & Co., 50, Whitehorse Road, Croydon...	2,780
J. W. Brooking, Richmond...	2,784
W. J. Renshaw, Putney...	2,751
J. Barker & Co., Ltd., Kensington...	2,719
T. Bendon, 48, Chancellor's Road, Hammersmith...	2,695
Myall & Upson, Clacton-on-Sea...	2,670
Millman & Co., High Road, Chiswick...	2,644
Speckley & Smith, Richmond...	2,632
J. Dorey & Co., Ltd., Brentford...	2,610

S. N. Soole & Son, Richmond	£2,600
Wisdom Brothers, Isleworth	2,570
F. & J. Foster, Suffolk Works, Norwood Junction	2,566
E. Wall, Garrett Lane, Tooting	2,524
R. T. Hughes & Co., Ltd.,* Portobello Works, Sheen Lane, Mortlake	2,505
A. G. Crisp,† Walthamstow	—
Stagg & Cox,† Shaftesbury Avenue, W.C.	—

* Accepted subject to the approval of the Local Government Board.

† Received late and not opened.

Barry.—For the erection of a small-pox hospital, for the Urban District Council. Mr. J. C. Pardoe, surveyor 160, Holton Road, Barry:—

J. Prout	£4,029 0 0
H. Fisher	4,020 0 0
D. Davies, Cardiff	3,950 0 0
W. Britton	3,946 5 7
T. Bevan, Penarth	3,870 0 0
H. S. Rendell*	3,792 9 10

* Recommended for acceptance. [Rest of Barry.]

Beckenham.—For the erection of certain extensions to the boys', girls' and infants' departments of the public elementary schools, Arthur Road, for the Education Committee. Mr. John A. Angell, architect:—

Martin, Wells & Co., Vauxhall	£7,015
Patman & Fotheringham, Islington	6,943
G. Parker, Peckham	6,888
F. W. Green, Beckenham	6,792
R. A. Lowe, Chislehurst	6,790
H. Heathfield, Beckenham	6,728
Wallis & Sons, Maidstone	6,712
Holliday & Greenwood, Brixton	6,581
W. H. Hyde, Norwood Junction	6,510
Syme & Duncan, Beckenham	6,490
H. Kent, 17, Albion Road, Lewisham	6,420
C. H. Price, Stoke Newington	6,358
Cropley Brothers, Epsom	6,343
Nightingale, Albert Embankment	6,318
Hawkins & Co., Ashford, Middlesex	6,207
F. & G. Foster, Norwood Junction	6,071
Jones & Andrews,* Beckenham	6,037

* Accepted.

Beckenham.—For the extension of the boiler and engine house, &c., at their electric light works, Arthur Road, for the Urban District Council. Mr. John A. Angell, surveyor:—

Holliday & Greenwood, Brixton	£2,555
Wallis & Sons, Maidstone	2,189
Patman & Fotheringham, Islington	2,173
Cropley Brothers, Epsom	2,159
H. Lovatt, Ltd., West Kensington	2,028
Jones & Andrews, Beckenham	2,020
B. E. Nightingale, Albert Embankment	1,978
W. H. Hyde, Norwood Junction	1,970
H. Kent, Lewisham	1,937
W. Wallis, Balham High Road	1,927
H. Heathfield, Beckenham	1,919
J. Smith & Sons, South Norwood	1,914
F. & G. Foster,* Suffolk Works, Norwood Junction	1,798

* Accepted.

Billingshurst.—For the erection of a new post-office.

Mr. C. H. Burstow, architect, Horsham:—	
W. Joyce, Billingshurst	£1,140
G. Potter, Horsham	1,123
Rowland Brothers, Horsham	1,099
E. Wade, Billingshurst	1,075
Reeves & Port,* Rudgwick	1,037

* Accepted.

Cheshunt (Herts).—For the erection and completion of a new petty sessional court and technical school, for the County Council. Mr. Urban A. Smith, county surveyor, Hatfield:—

L. & W. H. Patman, Enfield	£3,749 0 0
A. F. Almond, Enfield Highway	3,585 0 0
Farren & Son, Earith, Hunts	3,579 18 10
R. Archer, Cheshunt	3,525 0 0
Miskin & Son, St. Albans	3,408 0 0

Contracts Open.

UNIVERSITY COLLEGE OF SOUTH WALES AND MONMOUTHSHIRE.

TO CONTRACTORS, BUILDERS, and Others.

The Council of the University College of South Wales and Monmouthshire is prepared to receive TENDERS for the CONSTRUCTION of the FOUNDATIONS of the proposed New University College Buildings, at Cathays Park, Cardiff, according to the plans which have been prepared by Mr. W. D. CAROE, Architect, of 8a, Whitehall Place, London.

Copies of the plans, conditions, and form of contract may be seen at the Office of the REGISTRAR of the said College, Newport Road, Cardiff, or at the Office of the ARCHITECT, any week day after August 8th, 1905, between the hours of 10 a.m. and 5 p.m.

Copies of the bills of quantities have been prepared by Mr. F. T. MULLETT, of Downing House, Cambridge, and, together with the form of contract for the due execution of the work, may be obtained from the REGISTRAR after August 15th, on payment of a fee of £10s., which will be returned upon receipt of a bona fide Tender.

Neither the said Council nor the undersigned warrant the accuracy of the bills of quantities, nor does the Council bind itself to accept the lowest or any Tender.

The Builder whose tender is accepted must be prepared to find a guarantee for the proper performance of his contract which shall be satisfactory to the Council.

Sealed Tenders should be addressed to the REGISTRAR, University College, Cardiff, in a cover supplied with the quantities, and should be delivered on or before **TWELVE noon, on TUESDAY, August 22nd, 1905.**

Dated this 3rd day of August, 1905.

W. D. CAROE,

8a, Whitehall Place,
London, S.W.

WALLASEY URBAN DISTRICT COUNCIL.

EDUCATION COMMITTEE.

NEW SCHOOLS, St. GEORGE'S RD., WALLASEY.

TENDERS are invited for the whole of the WORKS required in the erection of the above New Schools in accordance with DRAWINGS and SPECIFICATION prepared by Mr. JOSEPH HOLT, A.R.I.B.A., 9, Albert Square, Manchester.

Copies of bills of quantities and general conditions with Form of Tender may be obtained from the Architect's Office, on and after the 14th AUGUST, 1905, on receipt of a deposit of £10s., which will be returned after receipt of a bona fide Tender.

Sealed Tenders marked "Tender for St. George's Road School," to reach me by post, not later than the 16th SEPTEMBER NEXT.

The Council do not bind themselves to accept the lowest or any Tender.

By Order,

Public Offices, H. W. COOK,
Egremont, Cheshire, Clerk and Solicitor.
August 3rd, 1905.

See p. xx for the Employment Register.

Privileges open to all Regular Readers of the "Builders' Journal."

I.—Free Monthly Advertisements.

1. A Free Advertisement of 12 words in the Wanted or Miscellaneous Advertisement Columns, in one issue of the BUILDERS' JOURNAL during each calendar month will be given to any regular reader.

2. The charge of one penny will be made for each additional word.

3. Advertiser's Name and Address or Box Number must be counted, but will in no case be reckoned as more than five words.

4. All advertisements must be accompanied by the correct remittance, and should a receipt be required a stamped addressed envelope must be enclosed.

5. The Proprietors reserve to themselves the right of refusing any advertisement.

II.—Free Answers to Enquiries.

1. The services of a large staff of experts are at the disposal of all regular readers who require information on architectural, constructional or legal matters.

2. Questions should in all cases be addressed to the Editor, and be written on one side of the paper only.

3. Correspondents are particularly requested to be as brief as possible.

4. The querist's name and address must always be given, not necessarily for publication.

Note.—Owing to the large number of enquiries we receive weekly, we are compelled to restrict the advantages of this department to Regular Readers.

III.—Free Accident Insurance of £500.

1. Every regular reader of the BUILDERS' JOURNAL is entitled to the benefit of this Insurance.

2. A Pamphlet giving full details of this and other Insurance schemes inaugurated by the BUILDERS' JOURNAL for the benefit of its readers, and guaranteed by "The Ocean Accident Corporation, Limited," will be sent on application.

What is a Regular Reader?

We have employed the term "Regular Reader" throughout these announcements as the description "subscriber" is often understood to mean one who subscribes direct to the publishing office.

We mean by a Regular Reader anyone who has placed an order with us or any newsagent or bookstall for the BUILDERS' JOURNAL for one year.

Those readers who order the BUILDERS' JOURNAL through their local newsagent or bookstall should send us the newsagent's receipt. Their names will then be placed on our subscribers' list, and they will be entitled to all the advantages set out above.

5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS.
OFFICE: 6, GREAT NEW STREET, FETTER LANE E.C.

6, Great New Street, Fetter Lane, E.C.

THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

August 23, 1905. Vol. 22, No. 550

6, Great New Street, Fetter Lane, E.C.

Summary.

Discussing English and French Gothic, an American contemporary calls the former a picturesque degeneration of the latter, "although the most insular form of the style, the Perpendicular, . . . is as far from being the most picturesque as it is from being the most Gothic." As for picturesqueness, one might as well ascribe to the mediæval English builder the "ivy mantle" which cloaks his tower, or even the moping owl which complains from it to the moon. But the ivy mantle and the moping owl are not architecture. (Page 114.)

An American architect has patented the use of glass for building houses. These glass structures consist of a double steel framework with wire-glass filled in between. Windows are not necessary for light, as sufficient comes through the walls above waistcoat height. (Page 107.)

The new Royal Naval Hospital at Chatham consists of a general hospital accommodating 468 beds and a zymotic hospital for 102 beds. The wards in the former are 120ft. by 28ft. 6ins. and in the latter 48ft. by 25ft. Teak floors are adopted for all the wards, the walls being plastered and finished in Keene's cement and painted either a light buff or green colour. The cost of the buildings has been £330,000, exclusive of furnishing. (Page 102.)

After studying the question of sewage-disposal for eleven or twelve years, Sir Alexander Binnie, C.E., has arrived at the conclusion that as far as possible all solid and floating matter should be removed from the sewage by mechanical means, and that the minute suspended matter still remaining should be reduced by the aid of those organisms with which we are well acquainted from the solid to the fluid state. The success of the London sewage works he attributes to the large volume of water into which the effluent is discharged. (Page 111.)

The "King's Own" Memorial Chapel at Lancaster Parish Church is 67ft. long by 21ft. wide and 24ft. 6ins. high to wall-plate. It has a very fine open-timber roof of oak, with moulded tie-beams with carved bosses, carved curves and tracery panels between queen-posts. A panelled ceiling with bosses at the intersections is formed over the altar. Messrs. Austin & Paley, of Lancaster, were the architects. (Page 110.)

It is said that the bursting of a tank on a tower at Witney, in Oxfordshire, was due to want of uniformity in the adjustment of the stay rods, so that some of them had more than their proper share of the load. It is remarkable that this tank was replacing one which failed under almost similar circumstances. (Page 106.)

Empty Houses in London.

THERE has been a good deal of talk in the daily press recently about the number of empty houses in London at the present moment, and all sorts of explanations have been advanced to account for this apparent abnormal state of affairs. House agents are complaining about the smallness of the business done, but they seem to forget that the number of house agencies has increased altogether out of proportion to the actual requirements. There is, however, a tendency for the wealthier to forsake the large houses in the suburbs, even in those a considerable distance out, just as some years ago they left once popular districts like Bloomsbury and Islington which after a period of lodging-houses are now developing flats. There seems to be no diminution in the demand for smaller houses at rentals of from £30 to £50 per year, but houses from £60 upwards are undoubtedly somewhat a drug in the market. People are disinclined to rent houses at such a figure, and they object still further to purchasing them because most of the houses to which we refer were erected on ninety-nine years' leases, the greater part of which has expired, their value consequently depreciating every year. This is one of the worst features of the leasehold system, and apparently the only remedy for the unfortunate landlord is to either let them at a reduced rental to poorer tenants or allow them to remain vacant. Either alternative is bad enough, because on the one hand the neighbourhood loses tone, while on the other an empty house requires continual expenditure of money to prevent it falling into decay. Several solutions to the problem have been suggested, such as the taxation of ground values and the compulsory purchase of freeholds. Ireland has already been granted facilities in this latter respect, though it seems peculiar that a country which has no housing problem should have been granted facilities for acquiring land while they have been withheld from England. Increased travelling facilities, such as electric trams, tubes and motor buses are responsible for many houses being vacant in London, but a good deal must be put down to the lack of method and common-sense on the part of some builders. For instance, in many districts building operations are being continued when it is palpable that the neighbourhood is already overbuilt, and again we know of at least one suburb where cottages

to let at about 9s. per week are being sandwiched between houses for which rentals of from £30 to £50 are demanded. It is perfectly obvious that these cottages must depreciate the district, especially when free season tickets for one year are offered in order to attract tenants. The logical outcome of such a policy is bound to be that the larger houses are vacated by the better class, who will migrate to a more select neighbourhood, while the places they leave will gradually develop into tenements and probably slums.

A Mistaken Idea.

READERS will recollect that when dealing with the Cheap Cottages Exhibition at Letchworth a few weeks ago we took occasion to point out that the public were likely to be misled into believing that all these had been erected for £150 each, whereas, as we stated, very few indeed have been built for this sum, and in the majority of cases the cost has been largely exceeded. We now find Sir James Crichton Browne expounding vigorously on the false basis in the presidential address which he delivered at the conference of the Sanitary Inspectors' Association held in London last week. At Letchworth, he says, the visitor is able to satisfy himself "that a serviceable and comely cottage, in all respects suitable for a labourer or working man and his family, can be built for £150, including builder's profit . . . Think of a detached cottage, well-proportioned and artistic in design, with a living-room with range 15ft. 6ins. by 11ft. 4ins., parlour with mantel-register 10ft. by 8ft., scullery with bath, hot and cold water, 9ft. 4ins. by 7ft. 6ins., three bedrooms 9ft. high, 13ft. 4ins. by 9ft., 13ft. 4ins. by 9ft. and 8ft. 6ins.; with pantry, two cupboards, coal-hole, shed for wood, w.c., water laid on, drains connected, rainwater butt, floor of scullery and pantry tiled, and say if it is dear at £150." Of course such accommodation at such a price is exceedingly good value, but it is not to be seen at Letchworth, and we therefore desire to contradict such a statement, which is likely to still further mislead the public. Most of the cottages at Letchworth have cost more than £150, exclusive of builder's profits and architect's fee, so that when Sir Crichton Browne speaks of all these, together with water-supply and drainage, as provided for the sum named we feel it is about time that some protest were raised.

ROYAL NAVAL HOSPITAL, CHATHAM: SOUTH FRONT. JOHN C. T. MURRAY F.R.I.B.A. ARCHITECT.

Photo: Eastmead, Rochester.

THE NEW ROYAL NAVAL HOSPITAL AT CHATHAM.

THE new Royal Naval Hospital at Gillingham, Chatham, which His Majesty the King opened on July 26th, and which we illustrate in this issue, is situated on a site with an average level of 220ft. above Ordnance datum and an area of about 29 acres. The subsoil is chalk, which forms an excellent foundation for the buildings. Red-brick facings and Doulting stone dressings (from the Ham Hill quarries, Norton, Somerset) are used throughout. The internal facing of walls not plastered or finished in glazed bricks is in picked stock bricks, dis-tempered or lime-whitened.

The general hospital is built on the pavilion plan, all the pavilions and the kitchen, stores, operating-rooms, dispensary, recreation- and waiting-rooms, administrative block and basement store-rooms being connected by a corridor.

The zymotic hospital is also on the pavilion plan, but is so arranged that all pavilions and offices are isolated from one another, access to the various buildings being gained by means of covered ways having open sides. The zymotic hospital is a self-contained establishment and is entirely separated from the general hospital.

Under the connecting corridor in the general hospital and under the covered ways in the zymotic hospital are large subways for steam, water and gas pipes, electric-light cables, electric-bell and telephone wires, &c. The basements under all the general hospital pavilions are used as stores; they are reached from the ground floor by staircases of Portland stone and by electric passenger lifts.

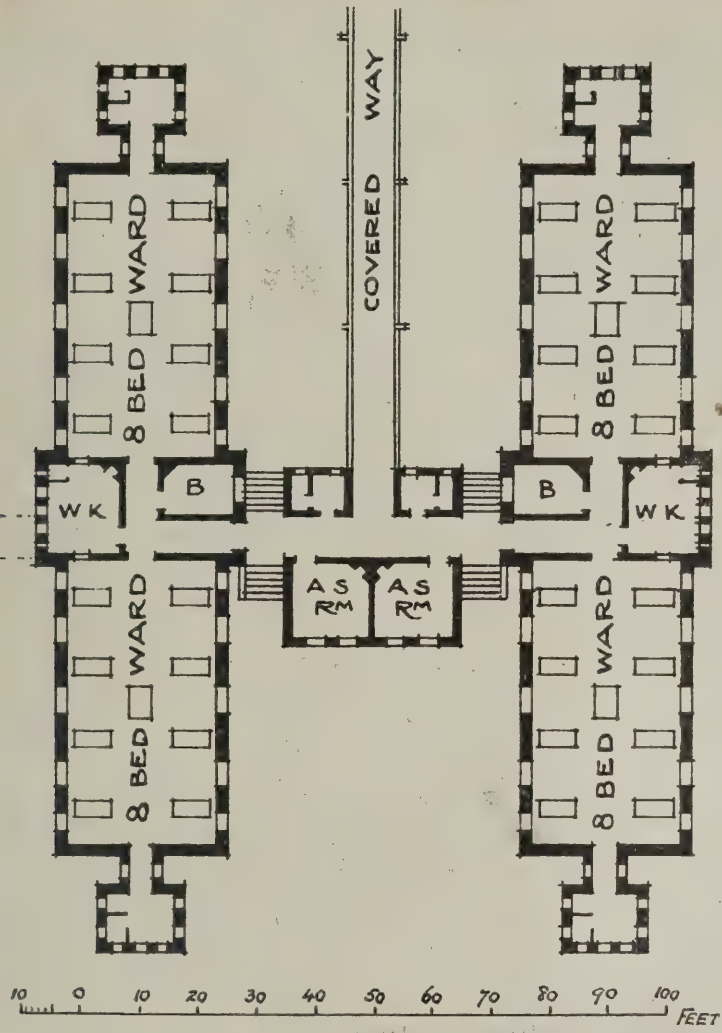

There are no basement store-rooms under the pavilions of the zymotic hospital, these having a large open space formed below the ground floor for the free circulation of air.

The Wards

in the general hospital have accommodation for 468 beds and in the zymotic hospital for 102 beds—a total of 570 beds. The large wards in the general hospital are 120ft. long by 28ft. 6ins. wide and in the zymotic hospital 48ft. by 25ft. The floors of all wards are of teak, secret-nailed and polished. The floors of all passages, corridors, lavatories, bathrooms, main kitchens and sculleries,

MAIN ENTRANCE TO ADMINISTRATIVE BLOCK.

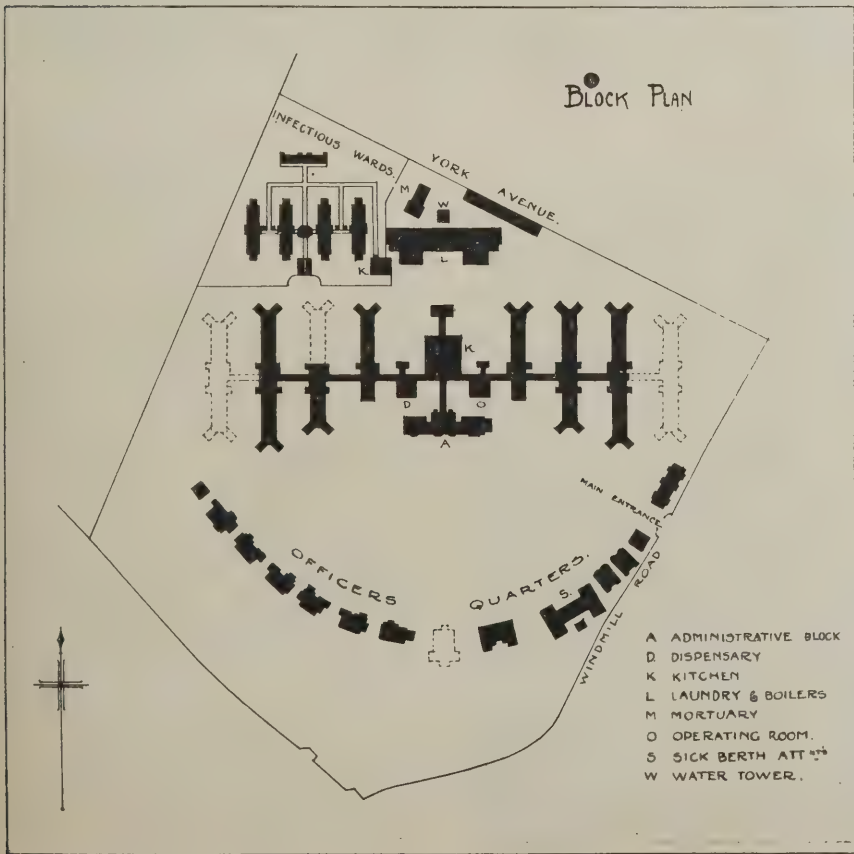

PLAN OF WARDS IN INFECTIOUS DISEASES HOSPITAL.

These twin wards are repeated on either side of a covered way having a central staircase.

PLAN OF ONE OF THE SURGICAL WARDS.

THE NEW ROYAL NAVAL HOSPITAL AT CHATHAM.
JOHN C. T. MURRAY F.R.I.B.A., ARCHITECT.

verandahs and balconies are of concrete, finished with marble terrazzo. The ground-floor wards have concrete floors with wood angle fillets embedded as a fixing for the teak flooring. The first-floor wards are carried on wood and rolled steel joists. The teak floors are polished throughout with "Ronuk." The ward walls are plastered and finished in Keene's cement and painted either a light buff or green colour.

Warming and Ventilating.

The system of warming and ventilating the wards is as follows:—In a certain number of window backs in each large ward and in the window back of each small ward is a small steam radiator, which is enclosed with a movable panelled mahogany front and a polished oak window board, each of which is covered on the inside with asbestos mill-board. Fresh air is admitted to these radiator chambers by means of gratings and flues in the outside walls, and the air, when warmed, is conducted to the wards by means of fire-clay flues built into the walls on each side of the windows and finished with adjustable inlets fixed 6ft. 6ins. above the floor.

The vitiated air is carried off by means of flues in the walls with outlet gratings just above floors and under ceilings, the flues being continued up chimney shafts or connected to steel trunks in roofs. The ventilating flues in chimney shafts and the steel trunks are finished with Truss extract ventilators.

In addition to the heating of the hospital buildings throughout by steam radiators and coils, each ward has central open coal-fire stoves.

Glazed Brickwork.

The walls of lavatories and latrines, as well as the main kitchens and sculleries, are faced with white-glazed bricks for a height of about 7ft., and the walls of all sink rooms and cleaning gear rooms are faced with salt-glazed bricks; also the dispensary. The main operating-room is faced with white-glazed bricks from floor to ceiling.

The baths in the hospitals are of white-glazed stoneware fitted with hot and cold water valves and a spray and douche fitting, and arrangements are also made in each bathroom for filling and discharging movable baths.

The first-floor wards in the general hospital are approached by Portland stone stairs with an electric lift in the well of each.

ROYAL NAVAL HOSPITAL, CHATHAM: NORTH FRONT OF ONE OF THE PAVILIONS IN GENERAL HOSPITAL.

Emergency stairs are also provided in the angle towers. In the zymotic hospital the first-floor wards are approached by two flights of stairs, situated in a detached staircase building in which are also two lifts.

The Operating Theatre and the Dispensary

in the general hospital are situated midway between the clock tower and the eastern and western pavilions. Both these rooms are top-lighted in addition to the ordinary windows, which, in the operating theatre, are of polished plate glass in gunmetal frames. The fittings in the dispensary are of mahogany and teak. The zymotic hospital is also provided with a small operating theatre and a dispensary.

The cooking apparatus in the kitchens is supplied by steam, with the exception of gas-ovens and grilles. There is also a small ward-kitchen with a cooking-range attached to each ward. Hot water is provided to all baths, lavatories, sinks, &c., by means of steam calorifiers in the basements of pavilions.

The Administrative Building

is situated on the south side of the general hospital, with which it is connected by a corridor; it contains board and survey rooms, offices for medical officers and staff, together with ophthalmic, X-ray and dark-rooms for photography. On the first floor of this building are a general laboratory, research room, pathological museum and medical library.

The sick-berth staff quarters provide accommodation for fifteen first-class stewards and

A WARD.

Photo: Morehen & Co.

ROYAL NAVAL HOSPITAL, CHATHAM: EASTERN ENTRANCE TO GENERAL HOSPITAL.

ward masters, 104 sick-berth attendants, and twelve night nurses. The building contains a kitchen, scullery, stores, recreation-room and mess-room, in addition to two large barrack-rooms and a number of cubicles.

Twelve houses and six cottages are provided to accommodate the general hospital staff; and one house for sisters, quarters for surgeon and ward master, and barrack-rooms for sick-berth attendants are provided in the zymotic hospital.

Mortuary and Laundry Buildings.

Separate mortuary buildings are provided for the general and zymotic hospitals, to the latter of which is attached an incinerator. The incinerator for the general hospital is situated in a small building at the base of the water tower. The general hospital mortuary contains a pathological laboratory and a small chapel.

In the laundry buildings are five boilers, each 24ft. long by 7ft. diameter—three providing steam for general heating, cooking and hot-water supply, and the remaining two boilers supplying steam to the laundry and dynamo engines, pumps, and washing and ironing machines.

Water-supply and Drainage.

The whole of the water-supply to the hospital is obtained from the local water company, and all water will be softened, except that used for gardens and roads and in case of fire. The water, after leaving the

softener, will be pumped into the tanks in the water tower and thence distributed to the buildings. Two large underground water tanks are also provided for the storage of rainwater, their total capacity being 70,000 gallons; this water will be used in the laundry.

For the drainage of the hospital there are two systems of sewers, one for soil and one for surface water, both connected to the Gillingham Corporation's sewers and storm-water drains. All soil drains are executed with Archer's patent joints, while the surface-water drains have ordinary joints. No surface water from the roofs of the zymotic hospital buildings is stored; and both the soil and surface-water drains from this establishment are connected to the Corporation's sewers separately from the general hospital drains. Disinfecting arrangements are provided in the case of all soil drains from the zymotic hospital.

Lighting.

Electric light has been installed throughout the hospital. Current is obtained from the Gillingham Corporation's generating station and transformed from an alternating to a continuous current by means of three motor generators in the dynamo-room of the hospital. Two sets of engines and dynamos are also being put down in the dynamo-room so that current can be generated in the event of a breakdown of the Corporation plant.

Offices and shops for the accommodation of the works department have been provided, as well as a chapel, and a stable for a steam lorry and ambulance trailers.

The total cost of the buildings, as now completed, is about £330,000, exclusive of furnishing.

Mr. John C. T. Murray, F.R.I.B.A., of 21, Old Queen Street, S.W., was the architect, and Sir Henry Pilkington, R.E., the civil engineer-in-chief; the work having been carried out under the superintendence of Mr. S. P. Brinson, Admiralty architect. Readers will agree that the buildings mass well together and that the design throughout is good, especially the main front to the administrative block.

The general contractors were Messrs. Perry & Co., of Tredegar Works, Bow, E. The heating and hot-water supply contract was executed by Messrs. Strode & Co., of Osnaburgh Street, London, and the electric lighting by the Alliance Electrical Co., of Grafton Street, London.

MAIN KITCHEN.

Photo: Morehen & Co.

ROYAL NAVAL HOSPITAL, CHATHAM: CLOCK TOWER AND DAY AND RECREATION ROOMS.

only propose to devote two days to measuring you can only attempt a small portion of a building. One bay of the cloisters of Worcester Cathedral, one of the Decorated chapels at the east end of Tewkesbury Abbey or the ruined Perpendicular chapel in the church of St. Lawrence at Eavesham would be suitable subjects for your purpose. In order to give a wider choice of subject the following places are mentioned:—Elmby Lovett, Hanbury, Stoke Prior and Tidmington contain Early English churches; Alvechurch, Hagley and Whitford contain Decorated churches; while fine churches of the Perpendicular period are to be found at Great Hampton, Kidderminster and Upton Warren.

H. Y. M.

The Design of Water Tanks.

[At Witney, in Oxfordshire, a new water tank has been erected on a tower in the place of an old tank which burst eighteen months ago. The new tank was filled one evening last month, and the next morning, following the example of its predecessor, it burst. The whole of the front of the tank was torn away. A correspondent asks for an explanation of this. We give Professor Adams's reply below.]

The tank on brick tower, of which an illustration was sent by a correspondent, is of cast-iron and was made by Messrs. Mather & Platt. It is 31ft. by 31ft. by 10ft. deep, having a capacity of 60,000 gallons. It had just been completed, and was being filled with water on July 20th, when one side burst out, the tank being only about three-fourths full. The failure is said to be due to want of uniformity in the adjustment of the stay rods, so that some of them had more than their proper share of the load. The broken parts are now being renewed. It is a remarkable fact that this tank is being erected to replace a wrought-iron tank of the same area, but 13ft. 6ins. deep with a capacity of 80,000 gallons, which failed under almost similar circumstances on February 22nd, 1904. This was made by Messrs. Rowell & Sons, of Chipping Norton, under the supervision of Mr. George Winship, F.G.S., consulting engineer, of Abingdon, and from its external appearance after the failure appeared to be insufficiently stayed. Local authorities ought by this time to be aware that tank designing is work for a specialist, and that initial economy may mean final disaster.

HENRY ADAMS.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Concrete Garden Frames and Edging.

DUBLIN.—GARDENER writes: "What is the gauge for mixing concrete for walls for garden frames about 12ins. thick and 2ft. high; also for garden edging 3ins. wide by 6ins. high?"

For garden frame walls 7 of large aggregate to 1 of Portland cement is ample. This can be plastered or rough-casted in cement. For garden edging we suggest 4 shingle, 1 sand and 1 of cement.

Buildings to Measure around Worcester.

PLYMOUTH.—REGULAR READER writes: "Please name some buildings in and around Worcester suitable to measure (in two days) for the R.I.B.A. testimonies of study."

The examiners of the R.I.B.A. prefer drawings of a complete building, but as you

MAIN ENTRANCE HALL AND CORRIDOR.

MEMORIAL ARCH AT CHATHAM.

THE Royal Engineers' memorial arch at Chatham, illustrated on this page, was unveiled by His Majesty the King recently. The design is by Mr. E. Ingress Bell, F.R.I.B.A., and is carried out in Portland stone of a specially selected quality.

The arch stands in a square or "place" which has been formed between the inner parade of Brompton Barracks and the forecourt of the Royal Engineers' Institute, and faces the Crimean Memorial Arch. In the four re-entering angles of the "place" the large bronze statues of Boers, lent by Lord Kitchener, have been temporarily erected on suitable pedestals, and Burmese and Boer

On a large panel above the arch an inscription records the circumstances of the erection of the memorial.

The friezes which run round the structure are of Istrian marble, and inscriptions filled in with lead give the names of the sixteen actions for which clasps were awarded with the war medals. The broad piers at the abutments of the arch have Istrian marble tablets, on which are recorded in leaded letters the names of the officers, warrant officers, non-commissioned officers and men (about 420) of the regular, militia and volunteer Engineers who lost their lives in the South African War. On one of the inner faces of the archway a similar tablet gives the titles of the various units of the

HOUSES BUILT OF GLASS.

MR. C. E. EASTMAN, a well-known architect of Des Moines, Ia., has just patented the use of glass for building houses, office buildings, hotels, &c. These glass structures consist of a steel framework supported by brackets attached to the beams of the floors, in duplicate, making two walls of opalescent wire-glass, the glass being set in the steel framework. The glass walls are approximately 1 ft. apart. This system of construction allows of any arrangement of floor plan, because windows are unnecessary, the light coming from the walls being sufficient even in the most thickly-built portions of a city where the buildings crowd

THE ROYAL ENGINEERS' SOUTH AFRICAN WAR MEMORIAL ARCH AT CHATHAM. E. INGRESS BELL, F.R.I.B.A., ARCHITECT.

cannon have been placed on the flanks of the two memorial arches. A principal feature of the structure is a series of sculptured panels in high relief showing:—(a) A typical blockhouse with barbed wire defences, telegraph lines and accessories; (b) a movable ox-wagon blockhouse; (c) a pontoon bridge with a team of wagons crossing it, and a military balloon in the background; (d) a destroyed railway bridge, with an armoured train running over a diversion in the bed of the river. All these have an historical value inasmuch as they are based upon photographs of the actual incidents and scenes. Two other panels, representing Paardeburg and Wagon Hill—where the Engineers particularly distinguished themselves—are required to complete the series.

Engineers that served in the war; and it is proposed to inscribe on a companion tablet on the opposite wall the fact that the memorial was inaugurated by His Majesty King Edward VII. as colonel-in-chief of the corps.

The alto-relievos are by Mr. W. S. Frith. The composite capitals to the columns, the keystones of the arches (figures of Victory), and the spandrels containing representations of the medals for this campaign, are the work of Messrs. Fagan & Bell. The marble tablets and inscriptions are by Messrs. Farmer & Brindley, and the copper lamps on the detached piers are by Messrs. Thomas Elsley & Co., Ltd. The general contractors were Messrs. Longley & Co., of Crawley, Sussex.

close upon one another and so block out the sunlight. For the same reason the exterior will admit of any style of treatment entirely free of the restrictions of fenestration. The inside treatment allows of a wainscoting half way to the ceiling, with glass over, so that wall-space is available for desks, counters, shelving, &c., on all sides of a room. If an outlook is desired, a portal of plate-glass of one thickness can be placed in the wall, or the columns in the treatment of the exterior can be of plate-glass forming bays. The cost of these glass buildings, compared with stone, terra-cotta or brick, is stated to be from a quarter to a third less for the outer walls; while the inner construction of the building is similar to that in general use, either in steel or masonry.

Tests on Timber.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Referring to the interesting results of tests on timber scantlings published on p. 81 of your issue for August 9th, may I point out that by an obvious error the headings "lbs." and "tons" to columns 1 and 2 of the table should be interchanged.

Commenting upon the results of the experiments, one is struck by the fact that the moduli of rupture given by Sir John Anderson, deduced by testing specimens 2ins. by 2ins., are from 62 to 90 per cent. greater than those obtained at the Bradford Technical College by breaking 12in. by 9in. pieces of the same length.

The discrepancy may be partly accounted for by the great temptation there is in experimenting with small scantlings to select only the best and straight-grained pieces, whereas the larger scantlings are much more likely to approximate in quality to those used in practice. Hence the superior value of such large-scale tests as those you publish.

In conducting these experiments it is unfortunate that no record is given of the percentage of moisture contained in the pieces tested.

Prof. Hudson Beare, in a lecture given at Carpenters' Hall on May 3rd, 1900, pointed out that the percentage of moisture influences the breaking strength of wood to a very large extent, the drier pieces invariably giving a higher breaking strength, both in compression and in bending tests. The increase of strength is most marked in compression, those woods which contain only 12 per cent. of moisture being, as a rule, about 75 per cent. stronger than the same woods when green.

The rate at which the load is applied is also an important factor in determining the breaking strength. By maintaining the load upon a beam for a very long time it has been found that failure will occur under a load representing only 60 per cent. of that required when quickly applied.

In any future experiments it would, therefore, seem highly desirable to ascertain and publish not only the percentage of moisture in the specimen at the time of fracture but also the rate at which the load is applied.—Yours truly,

HAROLD BUSBRIDGE.

PLUMSTEAD.

Cheap Cottages Exhibition.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Mr. Baillie Scott's reply to "X" will probably be sufficient for that gentleman; but others of the so-called extravaganzas in Mr. Scott's cottages are surely as absurd as the imaginary rough-cast on the chimneys. For example, "X" mentions the "expensive paving to front entrance," by which he presumably means the rough cobble paving with pattern formed in white stones—the materials for which were picked up, I believe, by the builder on and around the site!

"The huge proportion of roof," which is such a terrible expense in the eyes of "X," is really economical when the whole of the bedrooms are obtained in the roof space; as the usual waste of roof space (when the eaves are kept up to the height of the bedroom ceilings) is therefore avoided.

"X" seems to think that the dressers ought to be included in the competition amount. Why not the old oak furniture, window blinds, &c., as well?

I should think Mr. Scott will consider "X's" letter one of the highest compliments he has received on his houses.—Yours truly,

A. EDGAR BERESFORD.

ALDERLEY EDGE.

Keystones.

The new County and Grand Stands on Stockton Racecourse have been completed. The alterations and additions include new luncheon-, kitchen-, and stewards' retiring-rooms. The architects were Messrs. Mangnall & Littlewood, of Spring Gardens, Manchester.

Mr. Sydney A. Smith, hon. secretary of the Surveyors' Institution junior meetings, is about to pay a business visit to America and Canada, but during his absence all letters connected with the junior meetings for the ensuing session addressed to him at 22, Chancery Lane, London, will receive due attention.

The new Library at Glenalmond College is being constructed of stone obtained within the college grounds, Craiglea slates being used for the roof. The contractors are:—Builder, Mr. Robert M'Ritchie, Crieff; joiner, Mr. William M'Quibban, Perth; slater, Mr. Alexander Eadie, Methven; plasterers, Messrs. A. M'Ritchie & Son, Dundee; glaziers, Messrs. G. R. Douglas & Son, Perth. Mr. A. G. Heiton, of Perth, is the architect.

The Royal Theatre, Halifax, has undergone transformation. The proscenium front has been entirely remodelled; the fronts of the dress circle and gallery are new, a fresh scheme of colouring has been adopted, and the ceiling has been raised. New dressing-rooms, refreshment buffets and smoke-rooms have also been provided. The work has been carried out, at a cost of about £4,000, by Messrs. Waring & Gillow, under the supervision of Mr. A. Beedle, from the designs of Mr. J. J. Coventry; the electric lighting being by Messrs. Stafford & Co., under the direction of Mr. John Pell.

St. Mark's Church, Harrogate, is approaching completion. At present the building consists of nave and chancel. The former cost £9,000 and the latter £6,500. A tower is to be added. The building is being constructed of Pateley stone, from the designs of Mr. J. Oldrid Scott. The east window was executed in stained glass by Messrs. Powell & Sons, of Whitefriars, London. The clergy desks and choir stalls, which are of carved oak, are the work of Mr. R. Bridgeman, of Lichfield, while the stonework which adorns the chancel arch, the arches of the organ-chamber and side chapel are the work of Mr. John Baker, of London.

Norton and Lenchurick Parish Church is to be restored. The building was first restored about the year 1840-41, when a ceiling of lath and plaster was added. It is now proposed to remove this ceiling, which has become unsafe in several places, and to uncover the old rafters. It has been found necessary to include in the scheme the unroofing of the nave, as several of the stone tiles are falling from their places, having been secured by wooden pegs; these will be replaced with copper nails. The plaster on the walls will be stripped off to reveal the quoin stones of the windows and arches. It is hoped that new choir-stalls and seats in the nave may be provided, as the present ones are unsafe and unsightly owing to dry rot.

Ventilation of Cowsheds.—In a paper on "Some Points connected with the Sanitation and Management of Dairies and Cowsheds" which he read before the conference of the Sanitary Inspectors' Association held in London on Thursday last Dr. William Daley, of Bootle, said that the practical difficulties connected with the efficient ventilation of cowsheds could not be overcome if the air-space of the shippon were less than 600ft. per cow, but a well-ventilated shippon with this amount of cubic space was infinitely more wholesome than one with twice its capacity if not properly

ventilated. Cubic space would not compensate for ventilation. A healthy cow would stand any amount of incoming air near its head, but if the openings were so arranged that the air struck the animal near its hind-quarters, then injurious effects followed, with the result that the cowkeeper often blocked up the offending ventilators.

OUR PLATES.

THE "King's Own" Memorial Chapel at Lancaster Parish Church has been built at the north-west corner of the building. The north aisle wall has been taken down, the roof propped, and a new arcade of four bays inserted; these have moulded piers with moulded caps and bases, and the caps have a raised inscription in Latin taken from the "Benedicite," which is cut in the bell of the caps. The old windows and buttresses and base-course of the aisle have been most carefully taken down and rebuilt in the north wall of the new chapel, a parapet has been added, and most of the old building stones have been re-used in the external facing. The chapel is 67ft. long by 21ft. wide and 24ft. 6ins. high to wall-plate. The east end has an octagonal apsidal termination with circular shafts in the angles inside, which run up and support the drop rafters of the roof. In this end are a central three-light window and two side windows of two lights each. In the west gable is a tracery-headed five-light window, below which is the arched entrance doorway, screened on the inside by oak inner screen doors. A feature has been made at this end by an octagonal turret at the junction of aisle and chapel. This is carried up 36ft., the winding stairs having access to the roof gutters, &c. The chapel has a very fine open-timber roof of oak, with moulded tie-beams with carved bosses, carved curves, and tracery panels between queen-posts. A panelled ceiling with bosses at the intersections of the ribs is formed over the altar. The roof is covered with green slates and the chapel is lined inside with ashlar stone facing above a panelled oak dado. The aisle passages are laid with flags, the seat sections being laid with oak blocks. The sanctuary floor is laid with red and white marble in pattern. The retable in the east wall is of alabaster with carved paterae under the shelf. Between the arches are open screens of oak with tracery heads and moulded cornices and posts. The heating of the chapel is by low-pressure hot water and the lighting by electric pendants hung from the roof beams, the latter matching those in the church itself. The accommodation is for 150 worshippers. Chairs are provided for present requirements. The altar table, altar rails, litany desk and credence table are all of oak and have been designed by the architects, Messrs. Austin & Paley, of Lancaster. The work has been carried out by the following firms:—Masonry, J. Thoms; joinery, J. Hatch & Sons; plumbing and glazing, R. P. Wilson; slating, T. Cross & Sons; heating, Seward & Co.; electric lighting, Calvert & Heald—all of Lancaster.

Obituary.

Mr. James Salmond, civil engineer, of Dundee, died recently.

Mr. M. Marshall Milner, builder and contractor, of Lee Green, died recently.

Mr. James Pennington, builder, of Waterloo, Liverpool, died recently, aged 48.

Mr. Samuel Mather, surveyor to the Surbiton Urban District Council, died recently, aged 65 years. He was an associate member of the Institution of Civil Engineers and a member of the Sanitary Institute.

THE DRAINAGE OF LONDON.*

By Sir Alexander Binnie, C.E.,
Former Chief Engineer to L.C.C.

LONDON for the purpose of main drainage is divided by the River Thames into two entirely distinct portions, with distinct outfalls into the river: that on the north has its outfall at Barking, the system on the south having its outfall at Crossness.

Some idea of the difficulty of draining London may be gathered from the fact that out of the 121 square miles within the county at least 10 per cent., or 12 square miles, are situated below the level of high-water in the Thames, these districts being principally on the south side of the river.

Before 1855 the sewage of the Metropolis was discharged directly into the Thames by means of a series of sewers which ran practically at right angles to its course. This having caused the pollution of the river, the Metropolitan Board of Works instituted a series of intercepting sewers.

Sewers on the North.

On the north side of the river the high-level sewer, which acts by gravity throughout its own length, commences in the neighbourhood of Hampstead and Highgate, and passes to the outfall works at Barking. The middle-level sewer, taking its rise at Kensal Green and passing by way of Uxbridge Road and Oxford Street, is also a gravitation sewer from its commencement to the outfall at Barking. The low-level sewer which drains the lower districts north of the Thames commences at Hammersmith and is pumped about 16ft. at the western pumping station, where it is again pumped about 36ft. in the main outfall which passes to Barking.

The Isle of Dogs, the whole of which is below high-water mark, is served by a separate sewer, which also has a pumping station at Abbey Mills.

Sewers on the South.

On the other side of the river, in like manner, there are three intercepting sewers: one, the low-level, draining the district between Battersea, Bermondsey and Deptford, is pumped at the latter point and flows on to Crossness. The two sewers which drain the higher parts of South London receive the sewage pumped from the low-level at Deptford, but the combined sewage of the whole of South London is finally pumped at Crossness a height of 20ft.

The Outfall Works.

Up to 1888 the sewage was passed untreated into the river at the two outfalls, Barking and Crossness, but the pollution became so evident that the Metropolitan Board of Works, under the advice of my predecessor in office, the late Sir Joseph Bazalgette, commenced a series of precipitation works at the two outfalls. These works have been fully described by the late Mr. W. W. Santo Crimp and Mr. Edward Worth in a paper read before the Institution of Civil Engineers on February 23rd, 1897.

The principle adopted in these works is that of

Chemical Precipitation.

4 to 5 grains of lime and 1 grain of sulphate of iron per gallon being added to the crude sewage. It is then admitted into precipitation channels, from which the effluent water passes into the river. The sludge so deposited, after a further period of sedimentation, is pumped into ships and deposited in the sea twenty miles below the Nore.

These works as originally designed were estimated to deal with 150 million gallons of crude sewage a day and 3,000 tons of sludge per day. The total quantity of sewage now dealt with is about 132 million

gallons a day at Barking and 98 million gallons a day at Crossness, a total of over 230 million gallons. The quantity of sludge sent to sea is over two million tons per annum, containing a little less than 10 per cent. of solid matter. There are six ships of 1,800 tons gross and 1,000 tons nett capacity engaged in this work, and in the year 1900 their aggregate number of voyages totalled a distance of 236,000 miles. The capital cost of works of precipitation only, including ships, was £1,079,000, and the annual cost of working is about £161,000.

Wonderful Results.

The wonderful effect produced by the work of the past eleven years, as briefly described above, has been of a character which has surprised even those who were most sanguine at the time of the inauguration of the system. The river, which previous to 1890 was exceedingly foul in the neighbourhood of the outfalls, with large masses of black, floating matter, is now comparatively free from all noticeable pollution. In so speaking of the Thames it must be remembered that at the point of outfall it is a large navigable river of slightly brackish water, so that that refinement or purification which would be applicable in inland towns is not required.

During the past nine or ten years a series of experiments has been carried out on bacterial filtration, which has been fully described by Dr. Clowes, and about the efficacy of which there can be little doubt.

When we look at this important matter of the purification of the effluents of our sewage works we must all acknowledge that it is in a state of considerable uncertainty, as no one can confidently affirm that any one particular mode of treatment is the best or which can be applied under all circumstances. And this view is fully confirmed by the interim report of the Royal Commission on Sewage-disposal, which has recently been made public.

The Present Position of Affairs

may be said to be one of transition. Formerly it was considered that dead organic matter was almost, if not entirely, removed by the action of the oxygen in the air; in other words, that it was a process of burning up and of a more or less chemical character.

Within the last twenty years, however, principally owing to the valuable series of experiments carried out at Massachusetts, in the United States, we have been brought face to face with the fact that the elimination of dead effete matter is largely, if not entirely, due to the action of various microbe organisms. These organisms, acting for a longer or shorter period, appear to be able to reduce dead organic matter into an inert and harmless condition.

I have studied the question very carefully for the past eleven or twelve years, and the

Conclusions

at which I have arrived may be briefly summed up as follows:—

(1) That, as far as possible, all solid and floating matter should be removed from the sewage by mechanical means; for although undoubtedly these solid and suspended matters would ultimately be destroyed by the micro-organisms, yet the time required would be too long to admit of its application in ordinary cases.

(2) That, as far as possible, such minute suspended matter still remaining in the sewage should be reduced by the aid of those organisms with which we are well acquainted from the solid to the fluid state. This, to my mind, is the first step and the first lesson which we have clearly learned from our investigation into this wonderfully interesting subject.

The effluent sewage containing, then, a large proportion of dissolved organic matter, is in a condition to be further treated either by intermittent filtration in what are called

Contact Beds,

or by some other means being brought into contact with those organisms which have the mysterious power of reducing these dissolved organic substances, which if left to themselves would putrify and be the cause of offensive smells, if not of dangerous consequences.

In the case of intermittent filtration and contact beds considerable difficulty arises from the presence in the effluent, along with the dissolved organic matter, of certain mineral substances in a minute state of subdivision, derived, no doubt, from the washing of the streets. These latter substances, of course, cannot be acted upon by any species of bacteria, consequently, in course of time, they tend to clog up the filter beds themselves.

But intermittent filtration and contact beds is not the only mode of treating the sewage effluent which has been deprived of its grosser and more palpable organic matter. It is a well-known fact that if the sewage effluent be poured into a sufficiently large volume of otherwise comparatively pure water the dissolved organic matter contained in it disappears with remarkable rapidity; in other words, the contact bed, instead of being composed of coke or other solid matter, is formed of water in which the mysterious process of the reduction of the dissolved solids is carried on.

Of course, it is to be understood that the water into which the sewage effluent is discharged must be of large volume and in constant motion, and it is to this latter process that the success which has attended the London sewage works is to be attributed.

No doubt these works are not perfect, and at the present time require enlargement, but the success which has attended the work of the past eleven years is a sufficient guarantee that, if the surrounding circumstances are suitable, this mode of treatment is almost as good as any which at the present time can be suggested.

Law Cases.

Value of Premises in Piccadilly.—The case of the *Norwich Union Life Insurance Society v. the London County Council* came before Mr. Loveland Loveland, K.C., and a jury at the Clerkenwell Sessions House recently. This was a claim for compensation in respect of the compulsory sale to the Council of a strip of frontage, area 1,210 sq. ft., in St. James's Street and Piccadilly. The premises had a total area of 6,525 sq. ft., and 5,314 sq. ft. were thus left in the claimants' possession. Mr. James Green (Weatherall & Green) estimated the annual ground value of the property in question at £1 ts. 6d. per foot, and capitalized it at 30 years' purchase, adding 10 per cent. for compulsory sale and £10,000 for damage to the residue, his total being £52,949. In cross-examination Mr. Green said he did not know whether his figures worked out at one million and a half per acre. Mr. Runtz and Mr. Gruning gave evidence from an architectural point of view as to the user of the site. Mr. Leslie R. Vigers, member of the council of the Surveyors' Institution, expressed the opinion that the capital value of the site was £32 per foot, or £38,720. With 10 per cent. thereon for forced sale and an allowance in respect of damage to the remaining portion of the property, his total valuation amounted to just over £51,000. On behalf of the County Council Sir Edward Boyle called Mr. W. H. Warner (Lofts & Warner), who valued the land in question at 16s. a square foot, or £968, which he capitalized at 25 years' purchase—£24,200, amounting with 10 per cent. for forced sale to £26,620. Mr. G. H. Brougham Glasier, Mr. Howard Martin and Mr. William Woodward also gave evidence. The jury awarded the claimants the sum of £41,000.

* A paper read before the London Conference of the Sanitary Inspectors' Association on Thursday last, August 17th, 1905.

(Royal Academy Exhibition, 1905.)

THE TESTING OF NEW MATERIALS.

THE Bureau of Buildings of the Borough of Manhattan, New York, have gone into an investigation as to what specifications should govern the acceptance of new building materials. This was made necessary by the introduction of sand-lime bricks, cement bricks, hollow concrete blocks, &c. Common building bricks having been accepted as sufficiently strong, they were taken as the basis, and a series of tests were carried out by Prof. Woolson at Columbia University with a view to determining such factors as were necessary. As a result of these tests Prof. Woolson found that figures for transverse strength given in engineering books showed results from 20 to 50 per cent. too high. There was also no conformity between transverse and crushing strength and between strength and absorption. The crushing strength of the common American brick is about 4,000 lbs. per sq. in. When crushed wet, this figure is always lower by 10 to 45 per cent. For absorption tests Prof. Woolson recommends only partial immersion. He also recommends that the methods of testing bricks should be standardized, so that results may be comparable.

Following on these tests a number of regulations have been formulated and approved by the authorities of Manhattan. These stipulate that the material is to be subjected to the following tests: Transverse, compression, absorption, freezing, and fire; and additional tests may be called for when considered necessary. For the purpose of the tests at least fifteen samples or test pieces must be provided, such samples being approximately 8 ins. long., 4 ins. wide and 2 ins. thick. The transverse test is to be made first on full-sized samples, and the resulting half samples are then to be used for the compression and absorption tests.

Transverse Test.

For this test the sample will be placed flat on two rounded-knife-edge bearings set parallel, 7 ins. apart. A load will then be applied on top, midway between the supports, and transmitted through a similar rounded edge, until the sample is ruptured. The modulus of rupture will then be determined by multiplying the breaking load in lbs. by 21 (three times the distance between supports in inches) and dividing the result by twice the product of the width (approximately 4)

in inches by the square of the depth (approximately 2) in inches.

Compression Test.

For this test the sample must first be thoroughly dried to a constant weight, then carefully measured, then bedded flat in plaster-of-Paris or blotting paper, to secure a uniform bearing in the testing machine, and crushed. The total breaking load will then be divided by the area in compression in square inches.

Absorption Test.

For the absorption test the sample will first be thoroughly dried to a constant weight, the weight carefully recorded, and the sample then placed in a pan or tray of water, immersing it to a depth of not more than $\frac{1}{2}$ in. It will again be carefully weighed at 30 minutes, 4 hours and 48 hours respectively from the time of immersion, being placed in the water in each case as soon as the weight is taken. Its compressive strength, while still wet, will then be determined at the end of the 48 hours period.

Freezing Test.

For this test the sample will be immersed (as described) for at least 4 hours, and then weighed. It will then be placed in a freezing mixture or a refrigerator, or otherwise subjected to a temperature of less than 15 degs. Fahr. for at least 12 hours. It will then be removed and placed in water, where it must remain for at least one hour, the temperature being at least 150 degs. Fahr. This operation is to be repeated twenty times, after which the sample will again be weighed while still wet from last thawing. Its crushing strength will then be determined.

Fire Test.

For this test two samples are to be placed in a coal-gas furnace, in which the temperature will be gradually raised to 1,700 degs. Fahr. in one hour. One of the samples will then be plunged in cold water (about 50 degs. to 60 degs. Fahr.) and results noted; while the second sample will be permitted to cool gradually in air and the result noted.

Requirements to ensure Acceptance.

The following requirements must be met to secure an acceptance of the materials by the Manhattan authorities:—The modulus of rupture must average 450, and must not fall below 350 in any case. The ultimate compressive strength must average 3,000 lbs.

per sq. in., and must not fall below 2,500 in any case. The percentage of absorption, being the weight of water absorbed divided by the weight of the dry sample, must not average higher than 15 per cent., and must not exceed 20 per cent. in any case. The reduction of compressive strength must not be more than $33\frac{1}{3}$ per cent., except that when the lower figure is still above 3,000 lbs. per sq. in. the loss in strength may be neglected. The freezing and thawing process must not cause a loss in weight greater than 10 per cent., nor a loss in strength of more than $33\frac{1}{3}$ per cent., except that when the lower figure is still above 3,000 lbs. per sq. in. the loss in strength may be neglected. The fire test must not cause the material to disintegrate. (Note.—No great stress will be laid on this last test.)

Builders' Notes.

Reinforced Concrete in Austria.—Writing to the "Times" from Vienna, Mr. E. Probst says that the last few years have witnessed an enormous development in the use of reinforced concrete for structural purposes there, but very little competition exists because the industry is maintained in relatively a small number of hands. The floorings of many of the largest buildings, as, for instance, those for the new post-office and the new chamber of commerce at Vienna, are almost entirely of reinforced concrete, while the piers and floors of the most recently built warehouses are likewise constructed of armoured concrete.

Rugeley Church.—A new chancel, vestries and organ-chamber are being built at St. Augustine's, Rugeley, from the designs of Mr. F. L. Pearson at a cost of £5,000. Mr. Edwin Whittingham, of Newport, Salop, is the contractor.

The Calendar of the Glasgow and West of Scotland Technical College for the session 1905-06 has just been issued, and will be found to be replete with all information concerning the various subjects taught, fees, diplomas and scholarships. The calendar is published at 1s., and may be obtained from the Secretary and Director at the College in Glasgow.

Views and Reviews.

Municipal Engineers' Specification.

The first number of this annual text-book has just been published. It is a sister volume to "Specification," and deals especially with those aspects of construction in which Municipal Engineers are interested.

This first volume is divided into four divisions—I. Executive work (dealing with such subjects as Municipal cleansing, Municipal buildings, Municipal plant, Ambulances, &c.); II., Roads; III., Sewerage; and IV., Electricity supply. It is not possible in the compass of a review to consider the various articles and notes in detail, but in the first division we may notice the notes on "Dust-laying," by Mr. John Hatton, of Buxton, which will be of peculiar interest at the present time, owing to the difficulty in dealing with the dust problem, which the advent of motor cars has brought so prominently into notice. Mr. Hatton, after dealing generally with the recent steps taken by various public and private bodies to devise a remedy for the difficulty, deals in detail with all the various patented substances for laying dust, and gives particulars of the various experiments which have been made with each of them.

Another important article in the same division is that on disinfectants by Dr. David Sommerville, lecturer on Public Health at King's College. For very many years past, new disinfectants have been placed upon the market and actively boomed by their proprietors, which have had little or no value as germicides. At the Sanitary Institute Congress in 1903 Dr. Rideal and Mr. J. T. Ainslie Walker read a paper showing that in tests against certain bacteria cultures the majority of disinfectants were comparatively useless, or that the amount of them required to kill the typhoid bacillus was so great that in one case the cost of the disinfectant would amount to the incredible sum of £68.

An article by Mr. Sidney F. Walker on municipal motor wagons should be read with considerable interest. Mr. Walker's article deals very minutely with three different types of cartage wagons and the working of the machinery in each. An article by Mr. Arthur Ventris, Deputy Engineer of the City of Westminster, gives particulars of the working of the motor wagons in that city.

A section is devoted to the question of ambulances, a subject which is at present receiving the attention of the London County Council; and the notes prepared by Mr. W. R. Edwards, of the St. John Ambulance Association, on the various classes of ambulances and the details of the ambulance service in London, Manchester, Liverpool, Paris, Vienna, New Orleans and other places should be of considerable value.

In connection with the question of roads the articles on tar macadam are among the most important. A good deal of information in the book is given in tabular form, showing the cost and details of roadmaking and the various kinds of road materials used in different towns. In connection with tar macadam the methods of manufacture of this road material and the making of roads are given for fourteen towns. Though this material has long been used for the construction of footways in suburban and country districts it is only recently that it has been employed in the making of roads. The short trial lengths which have been laid on the Victoria Embankment will be watched with some interest.

Another question in connection with our city streets is the continual breaking-up of the surface to attend to the various mains and services. The only remedy for this appears to be the construction of subways, and it is worth noting that the London County Council in all the new streets it is

constructing is putting in these subways. A special article on the subject by Mr. R. M. Parkinson is given on p. 171, and designs for several different types of subways are illustrated and estimates given for the construction of the same.

Another subject that is dealt with at considerable length is the question of sewage treatment. In connection with this subject we reprint part of the editorial summary and conclusions on the published reports of the Royal Commission on Sewage disposal, and the notes on this question are practically an abridgment of the evidence given by the various experts before that Commission, supplemented by constructional notes to show the design of the various beds and filters:—

The elimination, naturally, of the foul matters in sewage is accomplished by the action of micro-organisms and their products; certain organisms eliminating the suspended solid matters in the absence of air, preparing the sewage for other organisms who eliminate the dissolved organic matters in the presence of abundant air. These processes are complicated by the existence of another large class of organisms, distinct from the other two, which is capable of working in the absence or presence of air according to the material presented to it to work upon. The waste products of the organisms also assist in the work of "breaking down" the polluting matters.

These micro-organisms are housed naturally in the soil within a few feet of the surface, and consequently the land has been utilized for the purification of sewage for a very considerable period. As far as can be ascertained, the various classes of micro-organisms are promiscuously mixed in the soil, and the two operations in the purification of the sewage may proceed side by side, but because of this the rate of purification is slow. It is believed that the organisms that require air predominate at the surface of the soil or nearest the air, and the others, working in the absence of air, deeper down; but as those deep down are required for the first stage of purification (the elimination of the suspended solids) and those on the surface are required for the second stage (the elimination of the dissolved organic matter), this may explain the slowness of purification by the soil. Moreover, long experience of purification by the soil has shown that if crude sewage is turned on to the soil it gradually clogs the surface with the suspended solids, possibly because the first-stage bacteria are not present there in sufficient numbers to deal with it.

Experience in land treatment has also proved that certain soils, those of the lighter kind having most interstitial space, are better for purification purposes than those of a heavy, close kind, having little or no interstitial space; and although no soil is, scientifically, useless for purification purposes, some soils are useless for the practical work of purifying a town's sewage, as they introduce requirements of time, area (and consequently cost), with which it is impossible to comply. Even where the soil is practically suitable for purification, the difficulty of the surface-clogging still exists, and this can only be obviated by relieving the soil of the initial work of purification, viz., the elimination of the suspended solids. This is accomplished by first screening the crude sewage, which is afterwards allowed to rest for a short period in tanks, during which a large portion of the solids mechanically subside, and the clarified effluent passes on to the land or to a filter, where the dissolved organic matter is dealt with by micro-organisms working in the presence of air. The same effect may be produced, but rather more speedily, by the addition of chemicals to the crude sewage, but in this case care

must be exercised that the quantity or properties of the chemicals added are not such as to inhibit or retard the subsequent necessary bacterial action to eliminate the dissolved organic matter. Both these methods, however, leave a residuum of mineral or organic solids termed sludge, and this is troublesome and costly to get rid of. It was at one time thought to possess great manurial value; but it is now known that the most valuable manurial properties in sewage only come into existence during the second stage of treatment. The difficulties with the land in practical purification led to the devising of artificial substitutes for the soil as a housing medium for the micro-organisms.

It has been found that, by the adoption of artificial beds and the separation as far as possible of the operation of the bacteria that do not work in the air, or anaerobes, and those that do require air, or aerobes, the process of purification can be accomplished more speedily than by treatment on the land, and the purification effected is as good or better. The elimination of the suspended solid matters are effected (if the chemical precipitation or simple subsidence methods are not adopted) by treatment in a septic tank, where the crude sewage is held up for a sufficient time to enable the anaerobes to change and liquefy the solid organic matters into ammonia; there is, in addition, some carbon matter present. As air is detrimental to anaerobic action the first septic tanks were covered in; but it has since been found unnecessary (as far as the purification is concerned), and the tanks are now mostly made open. The surface of the sewage in these becomes covered in a few weeks to two or three months after the first filling with a scum some inches thick which acts as an air excluder, and is due to the septicizing or putrefying action going on in the tank. The anaerobic action must, however, not be allowed to go too far or it will inhibit the subsequent bacterial action. The action in the septic tank is mainly that phase of fermentation called putrefaction, and offensive gases and smells are given off. On this account the use of this tank has been opposed in many quarters, and this opposition has led to attempts to carry out the whole of the purification by aerobic means, discarding the anaerobic action. The aerobic system is known as the "contact bed" system, and it may be either a "double contact" or a "multiple contact." In the first-named the crude sewage is first held up in contact on a bed of coarse material (as coke, &c.) and afterwards similarly rested in a bed of finer material; similarly in the "multiple contact" there are three or more beds from coarse to fine. The sewage is admitted at the bottom of the bed and rises until it reaches the top of the bedding material; the filling, it is held, must be done quickly. The bacterial action in these beds was presumed to be wholly aerobic.

That the action is wholly aerobic is open to grave doubt if crude sewage is being treated on contact beds. The natural action in the first stage of purification is anaerobic, and it is almost certain that this action persists in spite of the aerobic conditions aimed at in the bed. For the treatment of crude sewage the contact bed has been a failure. Even with the most careful management it shows a gradual loss in capacity by silting-up, and the surface is easily clogged; it is further slow in action.

Contact beds have, however, answered very well when used for the second operation of eliminating the dissolved organic matter. They constitute one class of filter in the final treatment; flow filters are the other.

The last division, devoted to Electricity Supply, is in charge of Mr. E. Kilburn Scott.

The Municipal Engineers' Specification, No. 1, 1905. 2s. 6d. nett. London: 6, Great New Street, E.C.

ENGLISH AND FRENCH GOTHIC.
A Breezy Criticism.

PROFESSOR BALDWIN BROWN, of Edinburgh, having come to the rescue of English Gothic in a recent number of the "North American Review," esteeming it to have been much too despitely treated by Mr. Charles H. Moore in his "Gothic Architecture," we find the "Architectural Record" of New York engaged in a breezy criticism of the Professor. Our contemporary observes: "It is true, of course, that, as Professor Baldwin puts it, 'English Gothic is so remarkable an artistic achievement that at one time to the insular imagination it represented the style in general, as if Gothic were an English institution in which other countries only shared.' Daniel Webster was at one time misled into making an address on the subject in which he waxed exceeding bold and said that Gothic architecture might properly be called English architecture, seeing that its principal monuments were in England. But that proves nothing but that the godlike Daniel did not know much about architecture. Poor Mr. Fergusson talked in much the same way, instituting elaborate and absurd parallels between Lichfield and Cologne, for example, to prove the superiority of the insular variety. But one thought it now recognized by serious students that the insular imagination would have been impossible, if it had been supplied with more information.

English Gothic not Belated French.

"Professor Baldwin has a good deal to say, and it is all instructive and worth saying, about the differences between the English cathedral as the nucleus or the result of a monastic establishment and the French cathedral as a church of the people. The very fact that the foreground and frame of the former are a 'close' and of the latter a 'place' is significant of many differences. Ruskin's vivid description of the typical English cathedral in the 'Stones of Venice' would have presented an even more vivid

contrast with a French cathedral than with St. Mark's, with which he contrasted it. But all that has nothing to do with the specific point Professor Baldwin tries to make, which is that English Gothic is not a belated copy of French, but a parallel and independent artistic development. To that effect he quotes a recent German historian that, 'regarded as a whole, Early English is an essentially autonomous (autochthonous?) style,' and that 'what it owes to French Gothic is only the first impulse.'

"Evidently this kind of discourse is equally aimless and endless until you have defined your terms.

What do you mean by 'Gothic'?

That is the first question. Professor Moore tells us exactly what he means by it. He means 'a system of construction in which vaulting on an independent system of ribs is sustained by piers and buttresses whose equilibrium is maintained by the opposing action of thrust and counterthrust.' If one accepts that definition, it will be difficult, if not impossible, for him to resist Mr. Moore's conclusion that there is no Gothic, properly so-called, outside of France, except what has been directly inspired by French examples. Does Professor Baldwin accept it? Apparently not, for he says, *inter alia*, 'we cannot reasonably condemn English work for falling short of the French ideal if it was all the time inspired by a distinct ideal of its own.' Very well. What was the ideal 'which was a rival to that of the French Gothic? If it was 'distinct,' it must be susceptible of distinct expression. But for such an expression, such a definition, we search Professor Baldwin's pages quite in vain.

"The German expression of

'Tectonics,'

which he adopts, and which denotes the devices by which a definite and organic structural scheme is carried into execution, he does not appear to think meets the whole case. Certainly, if it does, his case for the originality or the perfection of English Gothic is gone. Students who admire

Gothic as 'a system arising out of a principle,' to quote Mr. Eidlitz's: 'Nature and Function of Art,' will have no difficulty in agreeing with Professor Moore's conclusions about it. Such students would unhesitatingly select the choirs of Canterbury and Westminster as

The most Gothic things in England,

undeterred by the evident and admitted fact that they are the least English, and were in fact the work of Frenchmen imported to do them. The residue of English cathedral architecture they would dismiss as a picturesque degeneration of French Gothic in which the forms were retained but the reason for the forms had been forgotten.

To maintain that English Gothic is as Gothic as French Gothic, one must overthrow the definition of Gothic and produce a new one which English work fulfils as well or better than French. It does not meet the case to assert that the English, 'with their national genius for compromise, are satisfied in art with an attractive general impression and hesitate to apply the severer aesthetic canons.' On the contrary, it gives the case away. Neither is it to the point to say that the English parish churches are extremely picturesque and pretty, as they undoubtedly are. We have just called English Gothic a picturesque degeneration of French, although the most insular form of the style, the Perpendicular, which Professor Freeman, apparently on that account, finds 'on the whole the best,' is as far from being the most picturesque as it is from being the most Gothic. And so much that is adventitious enters into the picturesqueness of the English parish church that one cannot credit the architect with more than a share in it. He might as well ascribe to the mediæval English builder the romantic associations which form so much of the charm of his work, or the 'ivy mantle' which cloaks his tower, or even the moping owl which complains from it to the moon. The ivy mantle and the moping owl are not architecture."

ABLE ASSISTANT (24½) seeks RE-ENGAGEMENT. Careful draughtsman.—F. B. HOOPER, The Hermitage, High Wycombe.

A GOOD STAIRCASE and GENERAL HAND desires Leading or Foreman's place. Accustomed to work from Drawings and Specifications and to the control of men.—HITCHENS, 4, Goldsdown Road, Brimsdown, Middlesex. 1298

ARCHITECT and SURVEYOR'S experienced and capable all-round ASSISTANT desires permanency. Thoroughly well versed in quantities, working drawings, construction, steelwork, details, surveying and levelling. Moderate salary.—H., Preston Villa, Markenfield Road, Guildford. 1238

ARCHITECT and SURVEYOR'S ASSISTANT desires ENGAGEMENT, 3½ years' varied experience, able to prepare working drawings from rough sketches; surveying, levelling, &c.; moderate salary.—X., 48, Thornton Avenue, Chiswick, W. 1240

ARCHITECT and SURVEYOR'S ASSISTANT, A.R.San.I., desires ENGAGEMENT; 10 years' varied experience. Measuring up, contract drawings, details, specifications, knowledge of quantities, surveying and levelling, superintending works.—Box 1278, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S Junior ASSISTANT (22½) desires SITUATION. Excellent draughtsman, well up in construction, working drawings, measuring and plotting, specifications. Could assist with quantities. Six years' experience.—S. W. H., Brookdale, Manor Road, Teddington. 1268

ARCHITECT'S ASSISTANT (23), six years' Midland experience, chiefly domestic; surveys, working drawings, details, &c.; low salary.—Z., "Ingleside," Olton, Birmingham. 1253

ARCHITECT'S ASSISTANT, 21 years' general and public experience; competent quantity surveyor. First-class references. Salary, 3 guineas.—Box 1261, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S ASSISTANT (24) disengaged; competent; working drawings, all details, specifications; assist with quantities, land survey, &c.; moderate salary.—Box 1277, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S Junior ASSISTANT (20) disengaged September 4th. Five years' experience. London or country. Working drawings, details, good tracer, colourist, &c. General office routine. Salary 25s.—A. G. S., "Kirkdale," Stanmore Road, Leytonstone, Essex. 1279

ARCHITECT'S ASSISTANT (25), experienced; free after 16th September. Domestic and all work. Salary 35s.—J. SUGDEN, "Beeches," Frimley Road, Camberley. 1297

ARCHITECT and SURVEYOR'S ASSISTANT, 10 years' good all-round experience, desires re-engagement, temporary or permanent.—For reference, &c., write, X. Y. Z., 104, Derby Road, Loughborough Leicester. 1300

ARCHITECT'S ASSISTANT; 4 years' experience; working drawings, details, general work, assist with quantities, good tracer, colourist. Good references. Salary, 25s.—Box 1299, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S ASSISTANT, capable, energetic, eight years' experience, seeks re-engagement. Town or country. Salary £2 2s.—LASCALLE, 5, Dovecote Road, Wandsworth Common. 1302

ARCHITECT'S IMPROVER (20) desires Engagement. Working drawings, small details, good draughtsman, &c. Small salary.—R. R. H., 6, Cromwell Road, King's Lynn. 1294

BUILDER'S, &c. CLERK OF WORKS ASSISTANT (22); drawing, tracing, knowledge quantities and details; 4½ years in architect's office; certificates, building construction, advanced, 1st freehand, &c.—H. M. N., Thornicroft, Farnham, Surrey. 1243

BUILDER'S WORKING FOREMAN seeks permanency in private or jobbing firm in London district. Well up in all branches, plans, and details. Trade, bricklayer. Good references. Abstainer. Aged 30.—Wood, 80, Selwyn Avenue, Higham's Park, N.E. 1269

CLERK of WORKS or GENERAL FOREMAN disengaged; practical and reliable; experienced in all classes of public and private works; good references; town or country.—C. W., 53, Portland Road, Notting Hill. 1304

CRANE or ENGINE DRIVER FITTER, take charge of plant, thoroughly experienced; young man seeks situation.—F. W., 1a, Comboss Road, White Post Lane, Victoria Park. 1276

ESTATE OFFICES, ARCHITECTS, SURVEYORS.—Young Gentleman well up in Planning, Surveying, Levelling, Quantities, and Specifications, desires permanency. Experienced in General Management and Estate Development. A.I.S.E. and A.R.S.I.—Box 1311, BUILDERS' JOURNAL Office, Gt. New St., E.C.

FOREMAN of JOINERS seeks situation with a firm which turns out first-class work. Accurate setter out. Good references.—Box 1231, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

GENERAL FOREMAN, just finished contract, wants RE-ENGAGEMENT. Thoroughly competent in all branches. Energetic and reliable. Punctual time-keeper. Excellent London references.—G. T., Netherbrook, Nether Street, Finchley, N.E. 1263

GENERAL FOREMAN or CLERK of WORKS shortly disengaged, seeks RE-ENGAGEMENT, experienced in all branches. Reliable and accurate setter-out; good references; wages moderate; aged 48.—Box 1284, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

GENERAL FOREMAN.—Advertiser has had 5 years' experience as a Carpenter and Joiner, 7 months in charge as general foreman, and about 11 years in office work, management, drawing, quantities, &c. Wishes to get outside job. Would accept moderate salary as General Foreman.—Box 1301, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

GENERAL or WORKING FOREMAN (Carpenter) seeks SITUATION. References. Age 29. Gold and silver medals Carpenters' Comp., first-class certificate and bronze medal Carpenters' Comp. Exam.—W. S., 43, Skinner Street, Clerkenwell. 1305

MACHINIST. Competent spindle and all-round hand; first-class saw sharpener, cutter maker, &c. Good references.—Box 1260, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

MACHINIST (Joiners), spindle, tenon, general joiner, moulding, machines, &c.; all-round hand; take charge and set out if required; good references and reliable.—JOINER, 65, Fairfield Road, Bow, E. 1265

MACHINIST (24), spindle hand improver; can also work saw bench, band saw, overhead and panel planer; make cutters, sharpen saws.—MACHINIST, 18, Lausanne Road, Peckham, S.E. 1266

MASTER FOREMAN seeks RE-ENGAGEMENT; quick setter out; good manager; 15 years' experience; first-class references.—Box 1309, BUILDERS' JOURNAL Office, 6, Great New Street, E.C.

PAINTING, DECORATING, &c. Good work on reasonable terms. Town or country. Estimates given on the shortest notice.—YOUNG and LAWRENCE (Painters to the Trade), 28, Prairie Street, Queen's Road, Battersea. 1295

NOTICE TO OUR SUBSCRIBERS.

THE INDEX OF "THE BUILDERS' JOURNAL."

The Title Pages and Index to any volume of "THE BUILDERS' JOURNAL" may be had free, upon application being made to the Office, Great New Street, enclosing 1d. stamp to cover postage of same.

To Contributors.

THE EDITOR will be pleased to consider any articles, illustrated or otherwise, dealing with old and new buildings, methods of construction, or other matter of an architectural character. He will also be glad to consider architectural photographs and sketches (the latter preferably in black and white) and measured drawings of work in this country or abroad. News items of interest to architects and builders will also be considered, provided the name and address of the sender are given; no notice will be taken of anonymous contributions. All communications should be addressed to the Editor of THE BUILDERS' JOURNAL, 6, Great New Street, E.C.

Privileges open to all Regular Readers of the "Builders' Journal."

I.—Free Monthly Advertisements.

1. A Free Advertisement of 12 words in the Wanted or Miscellaneous Advertisement Columns, in one issue of the BUILDERS' JOURNAL during each calendar month will be given to any regular reader.

2. The charge of one penny will be made for each additional word.

3. Advertiser's Name and Address or Box Number must be counted, but will in no case be reckoned as more than five words.

4. All advertisements must be accompanied by the correct remittance, and should a receipt be required a stamped addressed envelope must be enclosed.

5. The Proprietors reserve to themselves the right of refusing any advertisement.

II.—Free Answers to Enquiries.

1. The services of a large staff of experts are at the disposal of all regular readers who require information on architectural, constructional or legal matters.

2. Questions should in all cases be addressed to the Editor, and be written on one side of the paper only.

3. Correspondents are particularly requested to be as brief as possible.

4. The querist's name and address must always be given, not necessarily for publication.

Note.—Owing to the large number of enquiries we receive weekly, we are compelled to restrict the advantages of this department to Regular Readers.

III.—Free Accident Insurance of £500.

1. Every regular reader of the BUILDERS' JOURNAL is entitled to the benefit of this Insurance.

2. A Pamphlet giving full details of this and other Insurance schemes inaugurated by the BUILDERS' JOURNAL for the benefit of its readers, and guaranteed by "The Ocean Accident Corporation, Limited," will be sent on application.

What is a Regular Reader?

We have employed the term "Regular Reader" throughout these announcements as the description "subscriber" is often understood to mean one who subscribes direct to the publishing office.

We mean by a Regular Reader anyone who has placed an order with us or any newsagent or bookstall for the BUILDERS' JOURNAL for one year.

Those readers who order the BUILDERS' JOURNAL through their local newsagent or bookstall should send us the newsagent's receipt. Their names will then be placed on our subscribers' list, and they will be entitled to all the advantages set out above.

5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS.

OFFICE: 6, GREAT NEW STREET, FETTER LANE E.C.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, Great New Street, Fetter Lane, E.C. Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

THE
BUILDERS' JOURNAL
AND ARCHITECTURAL RECORD.

August 30, 1905. Vol. 22, No. 551.

6, Great New Street, Fetter Lane, E.C.

Summary.

Of the late Mr. Alfred Waterhouse the "Times" says: "Whatever his defects of taste, a man who had such capacity and readiness in planning and designing buildings on a large scale, and who seemed able to grasp and deal with every practical problem in building as soon as it was presented to him, was essentially a great architect." (Page 125.)

The correspondence about the restoration of Iona is now about concluded. One critic says that the charm of the place has been wholly destroyed by the unholy and violent hands which mis-called "restorers" have laid upon it, to its most effectual and irretrievable disfigurement and wrecking. (Page 118.)

Some very interesting old Tudor wood-work has been uncovered in the course of alterations to Picton House, Hackney. (Page 116.)

Vitrified brick, laid in neat cement, has the greatest crushing strength of any of the incombustible and otherwise indestructible materials. (Page 117.)

A correspondent who has had between thirty and forty years' experience asserts that concrete does not expand to any appreciable extent in floors, walls, &c. (Page 122.)

Mahogany was first introduced into England about 1720. (Page 122.)

Among successful practitioners in the United States an undue proportion are men who owe their success to their abilities as organizers, promoters and business men rather than as designers, as architects. (Page 126.)

Photographs in the Architectural Association competition are to be submitted by October 1st. (Page 121.)

The long-drawn-out strike among the bricklayers at Newcastle has been settled. The wages are to be 9½d. per hour; piece-work rules are to be established; and in future disputes a conciliation board is to be called together. (Page 121.)

A scheme of cheap cottages after the manner of Letchworth has been commenced by a Fleetwood company near Blackpool. The first cottage has cost £180, including cartage and extras. (Page 119.)

Twelve large Boyle "Air-pump" ventilators with a diameter of shaft of 2ft. 6ins. have been fixed on the roof of Cannon Street Station, and prove very effective in clearing the air. (Page 121.)

Mr. Hare thinks that the rule-of-thumb standard of floor-space per reader in libraries is generally inadequate. (Page 126.)

Wide Streets and Open Spaces.

THE existing by-laws of this country have been subjected to much adverse criticism, and all sorts of ill-effects have been attributed to them, but very few persons have made suggestions complete enough to bear serious scrutiny. Of course the desire on the part of many people to do without any laws or regulations can be dismissed as altogether impracticable, and as tending only to a worse state of affairs than exists at present. It is a peculiar thing that all those who have come forward with suggestions for reforming the by-laws, instead of lessening their severity, have generally ended in increasing them. The latest proposal, and one which deserves investigation, is that of Mr. Isaac Richmond Dixon, of Manchester, who has written a long letter to the press in which he summarizes the progress made in the direction of housing reform in various towns in Germany. He reminds us that since March, 1901, every German town has been compelled to adopt a housing scheme by order of the Imperial Government. The powers given to the municipalities touch the root of the problem in so far that they provide facilities for the purchase of land in the immediate neighbourhood of towns and for the laying down of an organized system of thoroughfares, the adoption of which is made compulsory on all landowners who develop their estates for building purposes. Mr. Dixon suggests that the Local Government Board's model code of by-laws should be made stringent in regard to the width of roads and the amount of open space in connection with every building. He proposes that all yards of domestic houses should be not less than 40ft. super., as against the present 150ft. super., and that all new roads 150 yds. long should be 12 yds. wide; if 250 yds. long 14 yds. wide, increasing by 2 yds. width for every additional 250 yds. in length up to 2,000 yds., above which the maximum should be 30 yds. There seems to be no valid objection to increasing the open spaces in cities, for quick transit is now possible, and there can be no vested interest in land in the suburbs. The present ability of landowners to hold land until they can obtain an exorbitant price for it is simply iniquitous, and is the primary cause of overcrowding. The leasehold system, indeed, should be done away with. When we come to Mr. Dixon's other suggestions, we must say we think they are fatuous. He suggests that all foundations should be covered with cement-concrete or asphalt; that no staircases should be steeper than 45 degs., and should have a window opening to the outside and a handrail; that no living or

sleeping room should be less than 144ft. super.; no materials from demolished buildings should be used; and better mortar should be provided. In regard to the first of these suggestions to cover all the site with concrete, this is not hygienically necessary in all cases; it depends upon the subsoil. As to the second suggestion, an examination of architects' plans will clearly show that staircases can be so arranged that no such necessity arises and a hard-and-fast rule like this would only lead to extra expense. As to increasing the area of rooms, this would greatly increase the cost immediately. It depends upon the purpose for which the room is to be used as to what size it should be, and restrictions in this respect are inadvisable. As to old materials, they are seldom infectious, and when they are they can be disinfected.

Structural Accidents.

THE collapse of buildings from faulty construction has to be continually noted, and the difficulty of assigning blame makes it desirable that there should be some alteration in the existing law. The trouble arises in every country, and in some is far more acute than it is here. In the United States, where some shocking fatalities have occurred, an expert commission appointed by the Superintendent of Buildings in New York to investigate the collapse of a number of structures which fell at the beginning of the spring thaw has recommended that architects should be required by law to supervise the construction of buildings for which they have furnished plans, and that before a person is allowed to practice as an architect he should hold a diploma from some institution of learning or a recognized board; that all contractors for masonry, brick or structural steelwork should be licensed, it being unlawful for anyone unlicensed to carry out such work. The commission thought that such enactments would make the recurrence of similar accidents practically impossible and render the inspection of work in progress by municipal officials a matter of secondary importance. From this we may judge that not only would the authorities in the States have architects registered, but contractors also. It is apparent, however, that the architect should not be expected to give all the superintendence that is necessary to prevent faulty construction. He has to depend upon clerks of works and contractors; and the plan of the German Government in making all those responsible for the erection of buildings pass examinations before they are allowed to practise their respective professions and trades is therefore a wise one, and worthy of general adoption.

COMMITTEE-ROOM, HACKNEY CHURCH INSTITUTE.

OLD TUDOR WORK IN HACKNEY.

THE accompanying photographs show some interesting old woodwork which has been discovered in the course of alterations made to an old house in Hackney. This is Picton House, High Street, Homerton, which has of late years been used as the St. John's-at-Hackney Church Institute. The house was condemned by the London County Council as unsafe, but rather than let such an interesting landmark disappear the Rector of Hackney (the Rev. and Hon. A. G. Lawley) started a restoration fund, which amounted to about £3,000. The building was placed in the hands of Mr. Sydney Jeffree, of 9, Southampton Street, Holborn, W.C., who entered into the enterprise in a very praiseworthy spirit, and has taken extraordinary precautions to preserve everything of interest. Associated with Mr. Jeffree was Mr. Lionel Crane.

It will be seen from the plan that he has extended the accommodation by erecting a kitchen and offices, and a hall for meetings. These harmonize very well with the character of the old work, Luton bricks having been used to obviate the great contrast between the new and old work, which is in red brick, time-stained, almost black.

The courtyard, shown on the plan, was formerly roofed in with a collection of tumble-down sheds, but these have been cleared away, showing some fine old chimneys and brickwork.

All the old glass in the windows and the tiles on the roofs have been preserved as far as possible, and the old oak woodwork cleared of the many coats of paint with which some vandals had obscured it, though the front doors still await this cleaning process.

In the course of renovating the larger billiard-room on the first floor some fine old oak panelling was discovered underneath the wallpaper (shown in the view on p. 118). The panels over the fireplace are finely carved.

Similarly, the smaller billiard-room was found to be panelled in oak, and the fireplace, when uncovered, still disclosed the original painted panels in the spandrels of the arch. The two coats-of-arms shown in the view also preserve their original colouring.

The committee-room on the ground floor was also found to have oak panels carved peculiarly with a kind of imitation of folded linen. The two side pilasters were discovered in the cellar, and fit exactly into the positions

they now occupy; the bases only needed to be restored.

Plain oak panelling was found beneath the paper in the social room on the first floor (see p. 118), and the new portion that has been necessary to give continuity harmonizes well with it. There are some fine hand-turned balusters to the stairs. An old six-light window looking from the inner hall into the courtyard, constructed of oak mullions, has been repaired, and a number of bedrooms have been constructed in the attics, the old wooden tie-beams being preserved and exposed where below the ceiling level.

The secretary's room is panelled in woodwork of the Georgian period, painted white, and though of a different style is distinctly fine. The building dates in the main from the early Tudor period, but the old oak woodwork and panelling probably belong to an earlier building. Among the former occupiers were Thomas Sutton, founder of the Charterhouse, General Picton (of Waterloo fame), Nicholas de St. Croix—the French political reviewer, and Dr. Burnett, the schoolmaster, who numbered the great Lord Lytton among his pupils.

Messrs. Patman & Fotheringham, Ltd. (managing director, Mr. James F. Parker), of 100 and 102, Theobald's Road, London, and Islington, deserve praise for the great care and interest they have taken in the alterations which they have executed at this old house.

The oak panelling was restored by Messrs. Keble Brothers, of Carlisle House, Soho Square.

INTERNATIONAL HOUSING CONGRESS AT LIEGE.

THE seventh International Congress on Housing recently met at Liège, when the secretary was able to report that the membership numbered upwards of 700 and that they belonged to eighteen different countries. Delegates were present from all parts, those from France and Belgium being in the majority.

The first discussion dealt with the methods of public intervention in the supply of cheap dwellings, a subject which is not often discussed in England, but in Germany it was stated much is done in certain districts in the loan of capital to building societies either by the municipal savings banks, by hospital trustees, or by other public bodies who require a safe investment.

The second discussion was a highly technical one, on the incidence of taxation.

Sanitary Inspection.

The third matter discussed dealt with sanitary inspection, and on this all the delegates found themselves in accord. Systematic inspection, house by house and street by street, said one delegate, was what was required; and speaker after speaker simply repeated this. It was pointed out that inspection was economical when seriously undertaken and well done, since it prevented evil conditions from coming into existence. But the service required trained men and women, sufficiently numerous to enable them to work efficiently, and, above all, the loyal co-operation with these experts of the general body of citizens.

The Plotting of Towns.

The fourth section embraced the whole subject of the plotting of towns, and also a discussion on garden cities. The most valuable papers in this section were contributed by representatives of Germany, where, as is well known, the plotting of towns with due regard to their regular and orderly development is now a definite duty thrown on the municipality. Mr. Horsfall, of

SMALL BILLIARD-ROOM, HACKNEY CHURCH INSTITUTE.

Manchester, was among the speakers who urged the need for further steps in this direction. The garden city movement received generous support, although many delegates felt that garden cities could only touch a very small part of the problem of housing the masses. The secretary of the Congress, Professor Mahaim, of Liège, opened a useful discussion on the need of special enquiries as to housing conditions in different towns. Evidence was brought forward to show that only when the results of such enquiries, scientifically carried out, were available was it possible to say what had to be done in a town. The question of improving the appearance of workmen's dwellings without adding to the cost was also considered. Simplicity and directness were called for, and the abolition of false ornament, on the authority of Ruskin and Morris.

The final session of the Congress discussed workmen's gardens, the provision of allotments, and the utilization of what are called in America "vacant lots."

An International Committee.

A resolution was passed at the close of the discussions proposing the constitution of a permanent international committee to have an oversight of the matters considered by Congress. It was decided that the committee should consist of representatives from each of the countries taking part in the Congress, and that it should have its headquarters in Brussels. Mr. Lepreux, the president of the Congress, was elected first president of the committee. The English representatives appointed were Alderman Thompson, of Richmond; Mr. Horsfall, of Manchester; and Mr. H. R. Aldridge, secretary of the National Housing Reform Council. The last-named put forward, on behalf of the English delegates, an invitation to hold the next Congress in England in 1907—an invitation which was accepted.

CRUSHING STRENGTH OF PIERS.

ONE of the most interesting exhibits at the St. Louis Exposition, says Mr. George J. M. Ashby in the "Clay Worker," was that of the Watertown Arsenal tests, shown at the west end of the Government Building. The exhibit contained all the information on the face of it. There were twelve columns of equal dimensions. The rods on the outside of the brick and concrete columns which had been subjected to the crushing test served the purpose of holding them together. Signs told that these columns were "specimens of constructive timber, brick and concrete pillars, and columns tested at the Watertown Arsenal Testing Laboratory, Watertown, Mass."

Reading from left to right, the first five columns were timber. The first of these was Douglas fir or Oregon pine; the crushing strength was 732,000 lbs., or 6,360 lbs. per sq. in.; moisture 11.3 per cent. The next was long-leaf pine; crushing strength 616,300 lbs., or 4,400 lbs. per sq. in.; moisture 26.9 per cent. The third was short-leaf pine; crushing strength 504,000 lbs., or 3,780 lbs. per sq. in.; moisture 30.7 per cent. Next was spruce, 392,000 lbs., or 2,780 lbs. per sq. in.; moisture 42.2 per cent. The last timber was basket oak, showing a resistance to crushing of 431,000 lbs., or 2,950 lbs. per sq. in.; moisture 35.8 per cent.

Next in order were three concrete columns. The first of these was composed of Portland cement 1, sand 2, pebbles 4, and was reinforced with eight twisted steel bars. The age at time of testing was three months fifteen days; the crushing strength was 497,000 lbs., or 3,160 lbs. per sq. in. The second concrete column had a composition similar to the first, but was not reinforced. The age at testing was three months and seventeen days, the crushing strength was

272,000 lbs., or 1,710 lbs. per sq. in. The third concrete column, having a similar composition of cement, sand and pebbles, was reinforced with four corrugated bars; the age was three months sixteen days, the crushing strength 349,100 lbs., or 2,180 lbs. per sq. in.

The centre of the exhibit was occupied by three portions of columns, showing the method of reinforcing with steel bars.

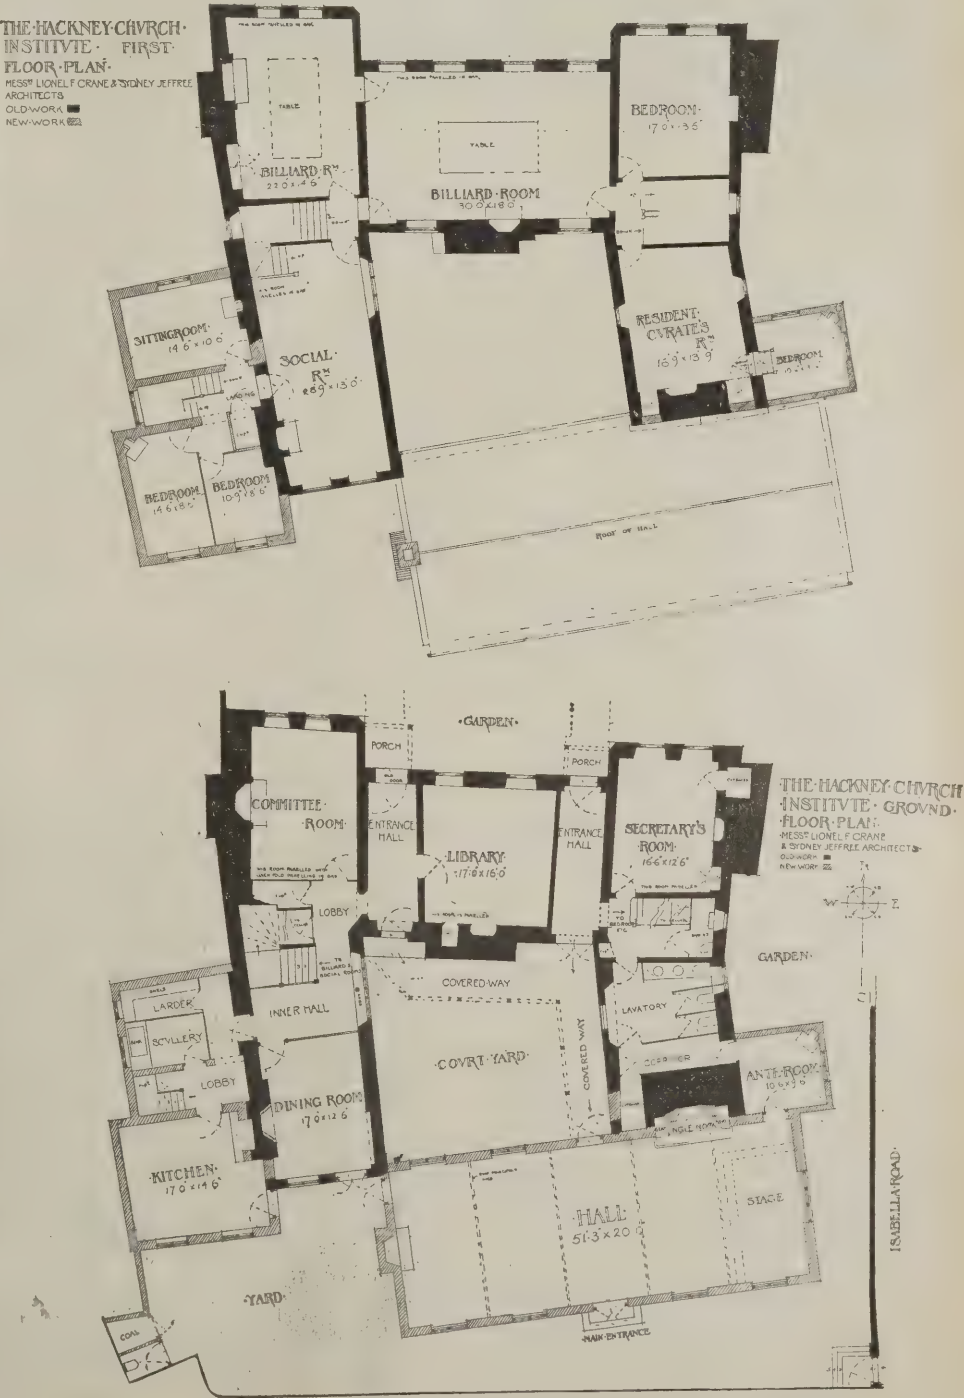

The last four columns were brick. The first of these was labelled "hard brick," laid in neat cement, age one month. The crushing strength of this was 623,600 lbs., or 4,700 lbs. per sq. in. The next "light hard brick." This was laid in lime-mortar—lime 1, sand 3; age twenty-four days. The crushing strength was 69,200 lbs., or 465 lbs. per sq. in. The third column was "wire-cut brick." This is a side-cut brick, laid in cement mortar, of cement 1, sand 2; age twenty-five days. The crushing strength was 342,000 lbs., or 2,410 lbs. per sq. in.

The last column was "dry-pressed brick," laid in neat cement; age one month. The crushing strength of this was 402,000 lbs., or 2,880 lbs. per sq. in.

By this it is seen that the vitrified brick, laid in neat cement, has the greatest strength of any of the incombustible and otherwise indestructible materials.

It was a very instructive and interesting exhibit, although the Government test merely gives a perfectly impartial statement of one set of comparative facts.

A new Baptist Church at Doncaster is being erected in Late English Gothic style at a cost of £3,500. The walls are faced with red Conisbro' bricks, with dressings to doors, windows, spire, &c., of Hathern terra-cotta. The roof is covered with Welsh slates and the ceiling is of pitch-pine. The architects are Messrs. John Wills & Sons, of Derby and London, and the contractors Messrs. H. Arnold & Sons, of Doncaster.

LARGE BILLIARD-ROOM, HACKNEY CHURCH INSTITUTE.

IONA CATHEDRAL.**More Criticisms of the Restoration.**

IN continuation of the letters by Mr. Honeyman and Mr. Champneys upon the restoration of Iona Cathedral, published in our issue for August 16th, we now give two further contributions to the controversy.

Mr. M. E. M. Donaldson writes: "Certainly for anyone who entertains any veneration for the past, the charm of Iona is wholly destroyed by the unholy and violent hands which mis-called 'restorers' have laid upon it, to its most effectual and irretrievable disfigurement and wrecking. Anything more hideous than the aggressive modern roof superimposed upon those ancient walls is inconceivable; certain it is that they will not be long able to support the indignity. Already ruin more complete than that wrought by centuries of stormy climate has been accomplished by the 'restorer.' Better, surely, a thousand times that the ruins should perish naturally (though this could be averted without rebuilding operations), and in their natural decay retain the old associations, than succumb to wrecking artificially and prematurely wrought, depriving them of all historic and antiquarian interest. As it is, yet another holy place is defiled and outraged.

"The Society for the Preservation of Ancient Buildings has already expressed its opinion on the use of a green roof and American oak scantlings without tie-beams; and with most people their specialist collective pronouncement will carry more weight than that of one individual, however distinguished. To talk of 'preservation' rather than 'restoration' in the face of the monument of ugliness, desecration and execrably bad taste erected in Iona is the sheerest nonsense. One would imagine that wholesale rebuilding operations were the only means of staying the ravages of time. Truly did Ruskin say that 'restorations' were either architects' jobs or ministers' vanities': they also spell the abomination of desolation—destruction. Have any preservatives ever been applied to the priceless crosses and their inefficacy proved that these monuments must needs be rooted from their ancient sites (as the guide announced was the intention) to the shelter of the appalling roof? We shall next hear of some 'enlightened scheme to preserve' Fountains Abbey by re-roofing; and of another to remove Stonehenge to the shelter of the nearest barn! Give, oh give us the 'ignorance' of Mr. Champneys in preference to the

superior knowledge of Mr. Honeyman if it leads to such iniquities as one now sadly witnesses in Iona. Would that contributions to the funds for 'restoration' had been much less than apparently they have been. If there is any good taste or a sense of the fitness of things yet left in Scotland, they will wholly cease when it is seen of what enormities 'restoration' as exhibited in the doubly-ruined ruins of Iona is capable."

Another Reply by Mr. Honeyman.

Mr. John Honeyman in reply says: "I have no wish to continue discussing points raised by Mr. Champneys in the columns of the daily press, but it is possible (though unlikely) that I may do so in our professional journals.

"I am disposed to agree with Mr. Champneys in one thing, namely, that when matters of fact only are under discussion it is right to omit such terms as 'ridiculous,' 'absurd' and the like. Still, in some circumstances even stronger terms may be legitimately used, and I think I may be pardoned if I partially 'relieve my feelings' by saying that I regard

the letter of your correspondent M. E. M. Donaldson as merely a tissue of hyper-sentimental foolishness, to which I could reply but would never dream of doing so. I was for many years a member of the Society for the Protection of Ancient Buildings, but when the Society departed from its original purpose and became practically a Society for the Destruction of Ancient Buildings—insisting that (like Mr. Donaldson) they should be allowed to go to rot—I left it.

"Perhaps I should explain that the much-abused roof was on the choir more than a year before I was consulted by the trustees, but I may add that there is abundant evidence to show that the slates on the old roof were at one time of exactly the same colour."

Mr. Champneys' Retort.

To the foregoing Mr. Champneys replies as follows:—

"Mr. Honeyman's consistency is certainly exhibited in his retirement from any society for the protection of ancient buildings—whatever precise form its principles may have assumed. I wonder whether the old slates to which he refers may not belong to the seventeenth-century repairs; also, whether the new form of internal roof (which he has himself introduced into the north transept) is, apart from all other considerations, as safe as that with the old flat ceilings. However, Mr. Honeyman having now retired from the correspondence on the subject, I shall not say more on any points that can be questioned, but merely state the position in which his letters leave the trustees, though this is sufficiently obvious. Subscriptions were asked for the restoration of Iona Cathedral. As to the north transept, their architect says: 'There is no restoration at all, nor any attempt at restoration'; and 'the gable is in no sense a restoration—it is a new design,' &c. The same statement is made in other words, but not less plainly, about the carving at the entrance to the sacristy; and as regards the greater portion of the internal roofing, and a certain part of the plaster, it is admitted. The trustees, then, are in the position of having asked money for one thing and allowed it to be spent on another."

New Chapel at St. Paul's.—At St. Paul's Cathedral the south-western chapel is being fitted up for the Knights of St. Michael and St. George, under the direction of Mr. Somers Clarke.

SOCIAL ROOM HACKNEY CHURCH INSTITUTE.

CHEAP COTTAGES.

A Seaside Scheme.

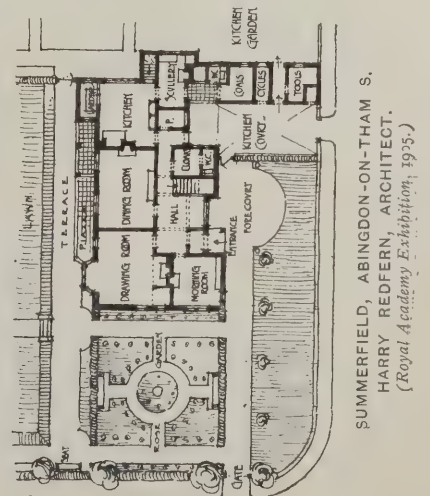

AT Thornton, near Blackpool, a Fleetwood company has an extensive tract of land, and a large portion of it has been set aside for the building of cheap cottages. The company has worked out its scheme somewhat on the lines of Letchworth, the sum of £150 being fixed as a basis of cost per cottage. The first cottage is now completed and tenanted, and the cost has worked out at £180, including carriage and extras. The plans comply with the by-laws of the Thornton Urban District Council. The company has purchased its own materials and sublet the labour. Materials are not specially cheap. The bricks had to be conveyed from Blackpool, and the tiles were from Staffordshire, but there is some advantage in having timber so near at hand as the Fleetwood dock. The cottage stands in its own garden, and has picked grey headers to the first floor and above, cement rough-casted and limewashed, with half-timbered gable and tiled roof. The living-room is 17ft. 3ins. by 12ft.; scullery, 11ft. by 10ft.; and the bedrooms are respectively 12ft. by 12ft., 8ft. 6ins. by 8ft., and 11ft. by 10ft. The height of all the rooms is 9ft. and cubical contents of bedrooms 2,916ft. The cost of the cottage works out at 4½d. per ft. cube. There is no bathroom, but the plan is so arranged that this additional convenience could be added over the porch at a cost of about £20. The washhouse and other offices are separately built at the rear of the back garden. Another cottage in progress is of a bungalow type and is estimated to cost £154. It will provide a kitchen 15ft. by 11ft.; scullery, 7ft. 6ins. by 7ft. 3ins.; pantry, 4ft. 3ins. by 3ft.; two bedrooms, 10ft. by 7ft.; and one bedroom, 10ft. by 9ft. The cubical contents of the bedrooms will be somewhat less than in the two-storey building, namely, 1,980 cub. ft.

Obituary.

Mr. Thomas Sharples, for thirty years general secretary of the Amalgamated Society of Painters and Decorators, died recently at Greenheys, aged 86 years.

Mr. Joseph Howe, head of the well-known contracting firm of Messrs. Joseph Howe & Co., of West Hartlepool, died recently, aged 55.

Mr. Duncan Stewart, of the firm of Messrs. Duncan Stewart & Sons, builders and contractors, Wallington, who died on May 9th, aged 67, left estate of the gross value of £59,487.

SUMMERFIELD, ABINGDON-ON-THAM S.
HARRY REDFERN, ARCHITECT.
(Royal Academy Exhibition, 1905.)

KING ST

GROUND PLAN

FIRST FLOOR PLAN

EAST GATE HOTEL, CORNER OF HIGH AND KING STREETS, OXFORD. EDWARD P. WARREN, ARCHITECT.

Ground-floor walls are faced with Brise Norton hammer-dressed and coursed rubble, the dressed stone being Monk's Park. The walls of the upper floors are of rough-casted brick. The roof is covered with green slates. The sign was designed and executed by Mr. George Simonds, sculptor, in coloured cement, and represents the old East Gate, which stood about this point. The builders were Messrs. Benfield & Loxley, of Oxford.

Keystones.

Ayr Brig is being inspected by many architects in consequence of Lord Rosebery's appeal through the press. Mr. Francis Fox, M.I.C.E., of Sir Douglas Fox & Partners, is to give a report to the Ayr Council, without fee, and Mr. John Strain, M.I.C.E., and Mr. John Carruthers, M.I.C.E., are numbered among those who are to give a gratuitous opinion on the ancient structure.

"Triumphs of Modern Architecture."—An article on this subject, by Mr. Hugh B. Philpott, appears in "Cassell's Magazine" for September. It is illustrated by a number of drawings and photographs, including some of Westminster Cathedral, Liverpool Cathedral, the Chartered Accountants' Hall, Lloyd's Registry, the new Sessions House, Cardiff and Sheffield town halls, the Rylands Library at Manchester and the M'Ewan Hall at Edinburgh.

Kingsway: Expected to be Finished by November.—The new thoroughfare from the Strand to Holborn, which is to be known as Kingsway, is now rapidly approaching completion. The section between Great Queen Street and Holborn has been finished some time, and between Great Queen Street and what used to be Sardinia Street the road and subways are in various stages of incompleteness. From Sardinia Street to Aldwych a great deal remains to be done, and some delay has been caused in arranging the drainage of a new side street. The portion opening into Aldwych is, however, sufficiently forward to allow of its being brought into use whenever the northern end of the section is completed. The Works Department of the London County Council confidently expects that the whole thoroughfare will be completed before November 8th, on which date it is hoped that His Majesty the King will perform the formal opening.

York Architects in Sheffield.—The members of the York Architectural Society recently visited Sheffield in order to see some of the new buildings which have been erected for educational purposes. Chief among these are the new University buildings in Western Bank. Here the visitors were joined by many members of the local society, and the combined party was conducted over the buildings by the architect, Mr. E. M. Gibbs. At the conclusion of the inspection the party left by special tramcar for Nether Green Council School, where the members were met by Mr. A. F. Watson, the architect of the building, who conducted them round.

Old Lead Tank at Richmond.—In a recent issue we illustrated a very interesting old cast-lead tank at 11, The Green, Richmond. We have now received a letter from Mr. W. I. Chambers, architect, saying he is anxious that any student or others desirous of seeing the tank and other interesting items in the house should have an opportunity of doing so, but he must confine their visits from 2 till 6 on Saturday afternoons only, as since the insertion of the illustration his house has been invaded by students and archaeologists at all inconvenient hours of the day. He also desires to say that he will obtain a list of the best things to sketch in Richmond (which we will publish) and that he must decline to answer any more letters on the subject.

Ventilation of Cannon Street Station: Curious Result.—Cannon Street Station was built during the years 1864-66, and the station was opened for traffic on September 1st, 1866. The roof is of wrought-iron with a single span. During the forty years which have elapsed since its construction, it has been painted several times, but owing to defective ventilation and to the action of the

gaseous fumes given off from locomotives the ironwork had become much corroded and weakened, while the covering was in a more or less leaky condition. It was found that the ironwork at the south end of the station was in the worst condition, the atmosphere being generally much fouler at that end. This is due to the fact that the engines of trains leaving the station give off a great deal of steam and sulphurous vapours in getting up speed, and in moist or foggy weather these vapours do not readily disperse, but hug the back of the screen. Additional ventilation has been obtained by adding twelve large Boyle "Air-pump" ventilators, with a diameter of shaft of 2ft. 6ins. These have proved effective, the atmosphere being now much clearer than was the case before the alterations. A curious circumstance is that the glazing requires washing only on the outside, the inside remaining perfectly clean.

OUR PLATES.

THE house at Reigate is to be built of red bricks and tiles; the bays are to be covered with cast-lead between the heads of the ground-floor windows and the sills of the first-floor windows.

The house at Bickley Park is built of red bricks, roofed with dark red hand-made Wrotham tiles. The builder was Mr. P. F. Duthoit, of Bromley, Kent.

Competitions.

Palace of Peace at the Hague.—The conditions of this competition are given in the R.I.B.A. Journal for August 26th.

New Assurance Offices at Cape Town.—Forty-six sets of designs have been submitted for new chief offices of the Southern Life Assurance Co. in St. George's Street, Cape Town. Six sets were disqualified. The first premium of £250 has been awarded to Mr. John Lyon, of Cape Town.

Council Schools, Bolsover.—In the recent competition for three council schools at Bolsover, for the Derbyshire Education Committee (limited to architects in the county of Derby), the first place for the Stanfree School has been secured by Mr. Clarence R. Ross, of York Chambers, Long Eaton, while for Langwith Bassett and New Bolsover the successful architect is Mr. H. Tatham Sudbury, of Lord Haddon Road, Ilkeston. Both have been engaged by the committee to carry out the works.

A Photographic Competition is held annually by the Architectural Association Camera and Cycling Club, and is open to all members of the architectural profession. The council of the Association offer a prize of three guineas for the best set of prints submitted. The main conditions are as follows:—(1) The competition is confined to sets of photographs adapted for the purposes of architectural study. (2) Each set should consist of not more than twelve prints and should illustrate one subject or class of subjects. (3) Copies of the winning prints by a permanent process must be deposited with the Architectural Association before the prize is presented to the winner. (4) Photographs must be sent to the secretary of the A.A. Camera and Cycling Club at 18, Tufton Street, Westminster, not later than October 1st. (5) The judging will be first of all by the committee of the Camera and Cycling Club as to the prints which reach a fair standard of technical excellence; they will then be finally adjudged by an authority on architecture (not a photographer) appointed by the president of the Association. The judge appointed by the president this year is Mr. Arthur Stratton.

Builders' Notes.

The Bridge over the St. Lawrence, at Quebec, now being constructed, has two approach spans of 100ft. each, two shore arms 500ft. in length, and a great central span of 1,800ft.—the longest yet built.

Uganda Bricklayers form a Union.—The whole of the industrial undertakings of the Church Missionary Society in Uganda have just been taken over by a public company, and some of the small chiefs, who act as foremen bricklayers or head men, have formed themselves into a sort of union for the purpose of regulating the number of apprentices admitted.

Nottingham Building Trade Dispute.—It would appear that, as a result of a joint conference last week between representatives of the masters and men, the threatened strike in the Nottingham building trade may, after all, be averted. A settlement has been arrived at upon the vexed question of "walking time," and the proposals as to a standard rate of wages and the letting of contracts are in a fair way of settlement.

The Screw Trade.—It is reported that an arrangement has been arrived at between British and German makers in the screw trade by which the severe competition which has prevailed for so long in this branch will come to an end. It is announced that a syndicate has been formed embracing all the makers in the trade, and that one uniform price has been fixed, representing an advance of about 50 per cent. on previous quotations. The British market is to be closed to the importation of German screws.

A Fatal Accident.—On p. 96 of our issue for August 16th we published a report of proceedings at a coroner's inquest upon the death of a stonemason who fell off a scaffold at Hanover House, a block of flats in course of erection at St. John's Wood. The Home Office inspector watching the enquiry made some remarks about carelessness that reflected upon the foreman in charge (Mr. Hosken). We wish to remove any such impression. The stated facts clearly indicate to anyone conversant with building operations that any such imputation would be groundless, and we agree with Mr. E. P. Warren, the architect of the work, who is pre-eminently entitled to an opinion, that the remarks of the inspector were quite uncalled for, and in no way justified by the facts of the case. We may mention that Mr. Hosken's carefulness and ability as a foreman are testified by Mr. Oswald Craske, builder, of Chelsea, in whose employ he was for eighteen years.

Newcastle Bricklayers' Strike Ended.—The conference held in Newcastle last week in reference to the local building dispute with the bricklayers resulted not only in a practical settlement of a long-drawn-out strike but established the adoption of the principle of arbitration to prevent future disturbances of the industry. The wages are to be 9½d. per hour; piece-work rules, previously existing, are to be established; the rule limiting apprentices is to be cancelled; and in future disputes a conciliation board of twelve representatives from employers and workmen is to be called together within forty-eight hours. Failing an agreement, a disinterested gentleman of known integrity will be invited to act as umpire and to give his casting vote. On wages the bricklayers have made the same concessions as the masons made at the end of May. The labourers will follow suit, and the plasterers, it is hoped, will fall into line.

HOUSE AT TRISCOMBE, SOMERSET.

(Royal Academy Exhibition, 1905.)

As the house is exposed, the design was kept low. The walls are of cement, rough-casted. The roof is covered with thick slates varying in colour from green to deep orange. The builder was Mr. Henry Pollard, of Bridgwater; the lead glazing and casements were carried out by Messrs. Burt & Potts; and the heating and hot-water supply by Messrs. Crispin, of Bristol.

Correspondence.

Expansion of Concrete Floors.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In reference to the correspondence on this subject in your issues for August 9th and 16th, resulting from an enquiry by "C. W." published on p. 24 of your issue for July 12th, my experience of between thirty and forty years with concrete in many forms is that it does not expand to any appreciable extent in practice. It may do so slightly, perhaps, but this is imperceptible in floors, walls, &c., where ramming or compression cannot be effectually performed. It is not then perfectly homogeneous, and the expansion, if any, simply increases the homogeneity in a minute degree. Concrete compressed in a machine occupies at least 5 per cent. less space than when not compressed. The expansion, if any, apparently ceases when the concrete is set, that is, within forty-eight hours, assuming the cement to be of good quality and seasoned, and the aggregate of a suitable nature; and, no matter how large the area of a floor, one portion will have ceased to expand while another portion is in hand.

Occasionally there appears to be direct evidence of expansion, the brick walls having been disturbed, but this, in every case I have come across, has occurred through the concrete resting on a portion of the wall and the outside portion of the latter having been built up (perhaps 9 ins. in height) for the concrete when soft to stop against. When concrete is in a soft state considerable pressure is exerted laterally (as we know when concrete walls are built between wood encasements) and the brickwork "bulges" where the concrete rests against it.

The expansion and contraction of concrete through changes of temperature is quite another matter, and is now well understood. In my experience reservoirs of concrete—cemented—have never been known to leak when underground and covered, whereas if open they have never been watertight. I well remember one of the latter class that held water perfectly during the summer months, but never during the winter.

An enquiry made of a clerk of works to a large public building brought the following reply, dated May, 1903:—

"In reply to your enquiry I have not found any expansion of concrete floors in any of the buildings, although several have been done now over four years.

"A number of the pavilions are 120ft. long and 26ft. wide, without a break or division wall, the ground floors being 5ft. from the

ground and the upper floors 14ft. above the ground floors. Had there been any expansion it must have shown long before now."

I know of nothing that can be more conclusive than this letter.

I never—except on one occasion to satisfy a client—used fillets round floors, and never remember a genuine case of any bad result from expansion. Mr. Flitton has evidently in mind the system adopted when plaster concrete was in vogue. Obviously where very hot or inferior cement has been used expansion may possibly occur up to two years after the work has been completed, owing to the chemical changes cement undergoes for that period, as Mr. Grant proved by experiments made for the old Metropolitan Board of Works. All this is, however, ancient history, and was fully dealt with many years ago in my book on "Concrete." There is, however, another feature connected with the use of cement that often occurs, namely, the development of cracks in walls built with cement-mortar long after they have been finished. This may be traced to the incompressibility of cement-mortar, the walls being as a result unable to resist the effect of climatic changes. Lime-mortar is more elastic, and is better able to yield sufficiently to avoid these cracks. If the cement is hot, or the proportion of sand to cement is too small, the possibility of cracks is much increased. If concrete floors are in proximity thereto they have to bear the blame; while if there are none, then it is put down to a "settlement." I have known numerous instances of this kind, and it would be useful to know if "C. W.'s" walls were built with cement-mortar. A certain means of judging whether hot cement has been used is that horizontal cracks are usually in evidence at various points, as well as vertical ones.

A correspondent writes: "When will engineers and architects refrain from using that very doubtful concrete aggregate 'coke-breeze'; it has nothing to recommend it, and it is certainly not fireproof." As a matter of fact, it is the coal-dust that is sometimes found in breeze that makes it less fireproof than some other materials; but I am surprised to read that limestone, which in a fire is rapidly converted into carbonate of lime, is the best material for fireproofing. The old rule that "anything that has passed through fire can best resist fire" still holds good in my opinion.* Coke-breeze is, however, a better material than it gets credit for. Messrs.

* Arrangements have been made by the Associated Portland Cement Manufacturers, Ltd., to have the resistance of various aggregates investigated shortly at the London Testing Station, and that should settle the question.—Ed. B.J.

Kirkaldy made a series of experiments for the West Ham Corporation on the comparative strength of brickwork and coke-breeze concrete, with the following result:—A stock brick pier 18 ins. by 18 ins. by 6 ins., built with blue lias lime mortar, crushed under 730 lbs. per sq. inch. A coke-breeze concrete pier of similar size, composed of 1 part of cement to 6 parts of breeze, crushed at 2057 lbs. This is a result which, except on the report of so eminent a firm as Messrs. Kirkaldy & Sons, would be taken probably with a grain of salt.—Yours truly,

THOMAS POTTER.

66, VICTORIA STREET, LONDON, S.W.

The Mahogany Stair Balustrade, Dunnikier House, Kirkcaldy.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—It might be interesting to know the date of this reputed fine balustrade, which now, unfortunately (according to your issue of August 2nd), appears to be likely to be removed from its original position. Mr. Frederick Litchfield in his excellent work, "The Illustrated History of Furniture" (published by Truslove & Shirley, 143, Oxford Street, W., 1892, price 25s.) puts down the year of the first introduction of mahogany into England as about A.D. 1720. This is the story he tells relative to it (p. 195):—"Mahogany may be said to have come into general use subsequently to 1720, and its introduction is asserted to have been due to the tenacity of purpose of a Dr. Gibbon, whose wife wanted a candle-box, an article of common use at the time. The doctor, who had laid by in the garden of his house in King Street, Covent Garden, some planks sent to him by his brother, a West Indian captain, asking the joiner to use a part of the wood for this purpose; it was found too tough and hard for the tools of the period, but the doctor was not to be thwarted, and insisted on harder-tempered tools being found, and the task completed; the result was the production of a candle-box which was admired by everyone. He then ordered a bureau of the same material, and when it was finished invited his friends to see the new work; amongst others, the Duchess of Buckingham begged a small piece of the precious wood, and it soon became the fashion. On account of its toughness and peculiarity of grain it was capable of treatment impossible with oak, and the high polish it took by oil and rubbing (not French polish, a later invention) caused it to come into great request. The term 'putting one's knees under a friend's mahogany' probably dates from about this time."—Yours truly,

FAIR PARK, EXETER. HARRY HEMS.

NEW BUSINESS PREMISES, HIGH HOLBORN, LONDON. H. PERCY ADAMS, F.R.I.B.A., ARCHITECT.

The basement and ground floors are built of Grey Royal granite, and the building above is faced with Portland stone. The turret is covered with lead, and the roofs with Westmoreland slates. The carving was done by M. Aumonier from sketches supplied by the architect. The internal joinery-work is chiefly teak and mahogany, the staircase being of teak. The ground floor consists of shops and bank or insurance premises, with basement rooms in connection. The four upper floors comprise suites of offices entered by way of a teak-panelled hall and lift from Southampton Street. The works were carried out by Messrs. Prestige & Co., of Pimlico.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Price of Bricks at the Cheap Cottages Exhibition.

WORKINGTON.—J. S. writes: "At what price per thousand are the bricks calculated in the construction of the cottage designed by Mr. Percy B. Houfton for Messrs. Green Brothers, and illustrated on p. 75 of your issue for August 9th?"

Mr. Houfton replies that Messrs. Green Brothers inform him that the bricks used in the cottage erected by them were local Arlesley make, and cost 20s. per thousand delivered on the site. The total number used was 20,900.

Sketching at Kirby Hall.

OLDHAM.—REGULAR READER writes: "To whom should I apply for permission to sketch at Kirby Hall, Northamptonshire?"

Permission to sketch at Kirby Hall, Deene, Wansford, may be obtained from Mr. J. Rooke, Estate Office, Weldon Grange, Corley, Kettering. H. M.

Places suitable for a Sketching Tour.

HESSLE.—O. H. W. H. writes: "I am desirous of spending a week or ten days in a neighbourhood where there are good examples of English Renaissance work for sketching, and should be obliged by any suggestions."

As you have only a week or ten days for sketching you had better go to some place where a large number of historic buildings are to be found close together, in order that no time may be wasted in travelling from one place to another. Such places are Cambridge and Oxford and, before all places, London. If you prefer a little travelling on your sketching expedition you will find Lancashire as rich as any county in good examples of Renaissance architecture.

H. Y. M.

Buildings to Measure in Lancashire and Yorkshire.

PRESTON.—ENQUIRER writes: "Please name any Renaissance buildings in Lancashire or Yorkshire suitable for the measured drawings of the R.I.B.A. final."

In Yorkshire perhaps the finest example of Renaissance work is Burton Agnes, which was commenced in the year 1603 and was added to in 1628 by Inigo Jones. Other examples in Yorkshire are Burton Constable, 10 miles north-east of Hull, built at different periods in the reigns of Henry VIII., James I. and Charles I.; Howsham Hall (Elizabethan); Slingby, built in 1603 and now in a ruined condition; Ripley Castle; Temple Newsom (Charles I.); Bowling Hall (Elizabethan, with towers of an earlier period); Woodsome Hall (Henry VIII., refronted seventeenth century); Ledstone Hall (Jacobean); Castle Howard and Buncombe Park, by Vanbrugh; Harewood; Wentworth Woodhouse; Nostel Priory; Snape (Perpendicular and Elizabethan); Mount Grace Priory; Ingleby Manor. —Lancashire is very rich in Renaissance work, of which the finest examples are Clegg Hall, Kenyon Peel, 1631; Speke Hall, half-timber; Hoghton Tower; Astley Hall. Some fine examples of domestic work are to be found around Manchester. Good work is to be seen at all the following places:—Ashton under-Lyne, Rochdale, Buckley Hall,

Chadderton Hall, Healey Hall, Wolstenholme Hall, Chadwick Hall, Extwistle Hall, Emmott Hall, Smithills Hall, Hall-i'-th'-Wood, Pleasington Hall, Gawthorpe, Nuttall Hall, Brandleham Hall, Samlesbury Hall, Clitheroe, Mearley Hall, Horrocksford Hall, Waddington Hall, Lea Hall, Ashton Hall, Borwick Hall, Capernwray Hall, Holket Hall, Swathmore Hall, Bendsea Hall, Croston Hall, Wigan, Haig Hall, Ince, Wardsley Hall, Kenpool Hall, Wansley Hall, Monk's Hall, old houses on the banks of the Mersey, Shaw Hall, Hale Hall, Bewsey Hall, Newton Old Hall, Bold Hall. H. Y. M.

"Sirapite."

X. writes: "Who are the makers of 'Sirapite'?"

The Gypsum Mines, Ltd., Mountfield, Robertsbridge, Sussex.

R.I.B.A. Testimonies of Study.

STUDENT writes: "Will the R.I.B.A. allow the testimonies of study of measured work for the final examination to be coloured up so as to distinguish the various materials?"

Yes; it is left to the discretion of candidates.

The Development of Building Estates.

PLYMOUTH.—REGULAR READER writes: "Please name a standard work on the development of building estates, including necessary sewerage, &c."

"Building Estates," by F. Maitland (price 2s. post free from our offices).

School Board Regulations.

HALIFAX.—INCOGNITUS writes: "Is there any schedule of conditions or special by-laws for the erection of elementary schools published under the new Education Act; or do the same requirements hold good as under the old School Boards before the introduction of the new Act? Where could I get a copy of such conditions?"

The schedule for school planning is published by Messrs. Eyre & Spottiswoode, 9, East Harding Street, E.C., price 2d.

Liability for Damage to Tiles.

X. X. write: "Makers consigned by Great Western Railway a truck of 1,520 tiles and ridges, of which 299 were admitted as being broken when tendered to us by the Great Northern. Senders say the tiles were packed in the usual manner, and the Great Western did not question this, but refused to carry unless senders signed a risk note, on the ground that they only took such goods at owners' risk, and on this both railway companies now base their refusal to pay claim. Although gross misconduct is obvious it cannot be proved and located. Senders say they compulsorily signed the note on our behalf (but we gave no authority) or tiles could not have left the station. Does a risk note absolve railway companies from liability when such a large proportion of the goods is broken? What course do you advise us to take?"

We cannot see that there has been any gross misconduct on the part of the railway company. The goods were packed by the senders and unpacked by you, and they ought to have been securely packed so as to stand the buffeting that necessarily occurs on a railway journey. If packed in the usual manner we can only say that was the wrong manner. However, the signing of a risk note relieves the companies of liability. An order for such goods should always require the senders to deliver the goods and take all risk, and if they paid the carriage in this case they are clearly liable for the damage. Considering that the goods were inadequately packed and that you were asked to give authority for the signature of the risk note, we think the senders would be held responsible.

THE BUILDING TRADES IN JULY.

THE Board of Trade reports that employment in the building trades during July continued dull and showed little change compared with June. It was worse than a year ago.

The percentage of unemployed trade-union carpenters and joiners was 6.5, as compared with 6.7 in June and 5.7 a year ago. With plumbers employment on the whole was much the same as in June. In England it was bad; in Scotland moderate. The percentage of unemployed trade-union plumbers was 10.1 at the end of July, as compared with 10.2 at the end of June and 10.5 a year ago.

With bricklayers, masons and plasterers employment generally was dull, and worse than a year ago. With slaters it was much the same as in June, being bad in England but fairly good in Scotland. It was worse than a year ago in England, but rather better in Scotland. Employment with painters was slack, and worse than a year ago. With builders' labourers it was dull on the whole.

The following is a summary of the reports received from all sources as to the state of employment in the various districts:—

London.—Employment, though still slack, was better than in June. It was, however, worse than a year ago. Returns received from 56 employers show that in the last week of July they paid wages to 11,091 workpeople of all classes, as compared with 10,899 in June and 13,065 in July, 1904.

Northern Counties.—In the Newcastle and Sunderland districts employment was affected by disputes. In the Tees and Hartlepool district employment generally was only moderate, and showed little change on the whole compared with June.

Lancashire.—At Liverpool and Manchester employment continued dull. At Bolton it was fairly active, and better than during June. At Oldham it was moderate. At Blackburn employment on the whole was moderate, and about the same in June.

Yorkshire.—Employment generally was slack, and showed no improvement as compared with June.

Midlands.—Employment generally was dull, and much the same as in June. At Birmingham, however, a slight improvement as compared with June was reported by the carpenters and joiners and plasterers, as also by the plumbers and plasterers at Leicester. At Coventry, Walsall and Burslem employment was fair.

Eastern Counties.—Employment generally continued slack, and was slightly worse than during June.

Southern and South-Western Counties.—Employment continued dull generally, and there was a further falling off in certain branches.

Wales and Monmouthshire.—Little change was reported compared with June, and employment generally continued slack.

Scotland.—In Glasgow employment generally was quiet, but a little better than in June. In Edinburgh employment has shown some improvement since the termination of the joiners' dispute. In Dundee and Aberdeen employment was dull; the improvement with joiners in June was not maintained.

Ireland.—In Dublin the improvement in June was maintained, and employment was moderate. In Belfast employment was moderate on the whole. In Cork it was much the same as during June.

Mr. F. R. Farrow, of Messrs. Colson, Farrow and Nisbett, architects and surveyors, 29, New Bridge Street, Ludgate Circus, E.C., informs us that his telephone number has been altered to "2328 Holborn."

THE LATE MR. ALFRED
WATERHOUSE, R.A., F.R.I.B.A.

MR. ALFRED WATERHOUSE, R.A., LL.D., who died on Tuesday last week at Yattendon, Berkshire, was born at Liverpool on July 19th, 1830. His father (also named Alfred Waterhouse) married Mary, daughter of Paul Bevan, and as both families (the Waterhouses and the Bevas) belonged to the Society of Friends Mr. Waterhouse was educated at the Quaker School, Grove House, Tottenham. His earliest architectural training was received in the office of Richard Lane, in Manchester, and it was in that city that he first began practice, at the close of 1853, after making an extensive tour in France and Italy during the same year. Mr. Waterhouse's wish as a boy had been to follow the art of painting, and the choice of architecture had been a compromise on the part of his father between Bohemia and commerce. The pictorial instinct was strong in the young student, and the architectural sketches which were the product of this Continental tour are very far from being the ordinary educational studies of a tyro. It was in 1859 that the competition for the important assize courts at Manchester gave Mr. Waterhouse the opportunity of exhibiting his powers of dealing with a complicated problem and of showing his colours in the matter of style. In his design, which was selected, he at once declared himself not only one of the Gothic champions, but also a master of the art of planning. About nine years later came his next great Manchester success, the winning of the competition for the town hall; and though he had as early as 1865 transferred his practice to London, Manchester continued throughout his career to give him opportunities of work. Among them may be mentioned the Owens College (1870-1901), the Salford Gaol, St. Mary's Hospital and the premises of the National Provincial Bank of England (1888), the Refuge Assurance Co. (1891) and the Prudential Assurance Co. Liverpool also has a fair share of his work in such important buildings as the University College, the London and North-Western Hotel, the Seamen's Orphanage, the Royal Infirmary, the offices of the Pearl Assurance Co., and the Turner Memorial Home.

Mr. Waterhouse's work in London may be said to have opened with the New University Club in St. James's, a bold application of Gothic art to an unusual purpose. Mr. Waterhouse came, it is said, very near to success in the great competition for the Royal Courts of Justice, and it was a significant fact that at the close of that remarkable process of selection the Government, in quasi-acknowledgment of a certain claim on the part of two of the unsuccessful competitors, Waterhouse and Barry, announced that they entrusted the latter with the alterations at the National Gallery and the former with the building of the National History Museum at South Kensington. As a matter of fact, there was no real compensation to Mr. Waterhouse in this arrangement, as he had

already been commissioned to erect the museum, which in its completed state may be regarded as a pioneer attempt in the use of terra-cotta on a large scale and as a vigorous essay in the free adaptation of Romanesque art to modern needs.

It was comparatively early in his career (1867 and 1868) that Mr. Waterhouse was entrusted with his first collegiate work—the rebuilding of large portions of Balliol College, Oxford, and Caius College, Cambridge. In the latter design he attempted a Renaissance *motif*, which, though it does a respectful homage to the immediately surrounding buildings, is hardly as successful as his later Renaissance and Classical designs, such as the National Liberal Club (1885).

ALFRED WATERHOUSE, R.A., F.R.I.B.A.

Other work of Mr. Waterhouse's is to be seen at Cambridge in Pembroke College (1871), Giron (1872), and also in the small bank for Messrs. Foster. Several other banks came under his care, notably Brown's Bank, Leeds (now Lloyd's) and the National Provincial Bank in Piccadilly. For the Victoria University he erected not only the already mentioned colleges at Manchester and Liverpool, but also the large range of buildings known as the Yorkshire College at Leeds. Of his schools, the chief are St. Paul's School, Hammersmith (1881), St. Margaret's School, Bushey (1895), and the Central Technical Institution, South Kensington (1881).

In 1870 Mr. Waterhouse was first engaged

by the late Duke (then Marquis) of Westminster in the alteration of Eaton Hall, Chester, a project which eventually developed into a complete rebuilding and gave the architect an exceptional opportunity that led to a very celebrated achievement. Other domestic work of importance was Iwerne Minster (1877) for Lord Wolverton; the rebuilding of Heythrop (1871), a severely Classic house, for Mr. Albert Brassey; Abinger Hall for Lord Farrer; Hutton Hall for Sir Joseph Pease; Springfield, Maidstone, for Mr. R. J. Balston; Buckhold, Berks, for Dr. Watney; Steventon, Hants for Mr. Harris; and a villa at Cannes for Mr. Grant Morris.

For the Prudential Assurance Co. Mr. Waterhouse designed not merely the premises in Holborn, which date from 1876 to 1901, but branch offices in various principal towns, such as Edinburgh, Glasgow, Newcastle, Nottingham, Leeds, Bradford, Dundee, Hull and Birmingham.

His principal hospital work is that for the University College Hospital in Gower Street. The Nottingham General Hospital (additions) and the Alexandra Hospital at Rhyl deserve mention. Mr. Waterhouse designed two Congregational places of worship—the Lyndhurst Road Chapel at Hampstead and the Weighhouse Chapel, Grosvenor Square. His best church is that of St. Elizabeth Reddish. It remains to mention two more buildings in London—the Surveyors' Institution in Great George Street and the Jenner Institute of Preventive Medicine at Chelsea. During the last twenty years his services were in frequent request as assessor in architectural competitions.

From 1888 to 1891 Mr. Waterhouse was president of the Royal Institute of British Architects, of which he had been a member since 1861. He received the Royal Gold Medal of that body in 1878, became an Associate of the Royal Academy in the same year and a full R.A. in 1885. Many foreign Academies honoured him with their diplomas, notably those of Vienna (1869), Brussels (1886), Antwerp (1887), Milan (1888) and Berlin (1889). As early as 1867 he acquired a Grand Prix at the Paris Exhibition, followed by a "Rappel" in 1878. In 1893 he was a "Membre correspondant de l'Institut de France." In 1898 he was one of the international jurors in the competition for rebuilding the west front of Milan Cathedral; in 1890 he sat on the Westminster Abbey (Burials) Commission; and in 1895 he received from the Victoria University the honorary degree of LL.D.

Mr. Waterhouse married in 1850 Elizabeth, daughter of John Hodgkin, barrister-at-law, and had five children, four of whom survive. His eldest son, Mr. Paul Waterhouse, was in partnership with him since 1891.

A great part of the leisure of Mr. Waterhouse's life was devoted to landscape painting in water-colour, and latterly in oils. Three times he built himself a house—first at Manchester (Barcombe Cottage, Fallowfield), next at Reading (Fox Hill, Whiteknights Park), and finally at Yattendon, Berkshire, where he died.

Commenting on his work the "Times" says: "It would be affectation to ignore the fact that among the younger school of architects and artists Mr. Waterhouse's architecture was not regarded with favour or sympathy. . . . As far as his earlier Gothic buildings are concerned, this depreciation is to a great extent the result of the change of architectural fashion. When the Manchester Assizes Courts and the town hall were built their architect was regarded as an artistic leader. Now that the mediæval revival has run out, these works are regarded with indifference—a change of front which is hardly fair to him. As regards his later works, unconnected with the Gothic Revival, their prevalent defect is, no doubt, a florid character of detail and a want of repose. His University buildings, those at Caius College especially, are not in harmony with the *genius loci*. Perhaps he never quite got over the influence of a Manchester training; for Manchester architecture, like Manchester politics, had at one time its own special characteristics. But the prejudice against his architecture has been carried, in what may be called "æsthetic" circles, to an absurd and unreasoning extent. It is criticized by people who could not themselves have planned Mr. Waterhouse's buildings, or even, perhaps, understood the points of his planning. Whatever his defects of taste, a man who had such capacity and readiness in planning and designing buildings on a large scale, and who seemed able to grasp and deal with every practical problem in building as soon as it was presented to him, was essentially a great architect. . . . Personally Mr. Waterhouse was one of the most genial and attractive of men. Good health, cheerfulness and good nature seemed expressed in his appearance and manner, and probably of few men could it be more truly said that he was liked by all who knew him. Even those who did not like his architecture loved the man. . . ."

LIBRARY PLANNING.

MR. HENRY T. HARE, F.R.I.B.A., in a paper read before the Library Association at Cambridge last week said that he was invited to deal more particularly with the question of the design and planning of the buildings for public-library purposes, and he might say that it was by no means easy to meet all the requirements in a perfectly satisfactory manner. The leading requirements of the building were (1) ample space or area in all parts; (2) abundance of light, air and ventilation; (3) facility for supervision and working. He suggested that the rule-of-thumb standard of floor space per reader was generally inadequate. Almost all their public libraries were much too closely packed in their arrangement for the comfort, health and free circulation of readers.

Mr. F. J. Burgoyne (librarian of Lambeth) thought that during the past few years there had been great developments in the art of library planning. Since Mr. Carnegie's benefactions had been the means of exciting the emulation of architects in all parts of this country and America, the results showed that many plans had been evolved well worthy of consideration. No model plan could be the best for all, with the varieties of size, area, shape and position of sites. Various statistics were given on which to base plans of any given library. Before the building was planned architects should obtain from the librarian a clear idea as to the methods of work to be employed in it. He hoped that his remarks would tend to obviate the fatal error so often made in purchasing ground too small for wants and in erecting buildings incapable of extension.

SOCIALISM AND THE ARCHITECT.

By Charles Henry Israels.

THE industrial machinery of the twentieth century demands of each individual the performance of the task for which he is best equipped. The tendency of the age is towards specialized and co-operative effort. Each department has its definite area of activity, and co-operation itself is obtained through specialists in executive management. Most of the forces of industry are instinctively adjusting themselves to the new conditions. They have selected their own positions in the movement. A few have refused to recognize the tendency: the procession has swept by, and being unable to carry them along has ruthlessly bent them in the direction of progress—where they either remain stationary or are forced into positions for which their workers are ill-equipped and their original destiny perverted.

The Architect a Business Man.

The complex building trades have responded in the main to this tendency—all but the architect. He is reactionary. Architecture in past ages was an art. Its practitioners were recognized as artists. The architect still proclaims himself an artist, but in a large measure he has become a business man; and the practice of architecture has become a business. A list of the most successful practitioners in the United States would contain the names of an undue proportion of men who owe their success to their abilities as organizers, promoters and business men rather than as designers, as architects.

The architect may deplore the fact; but he is himself responsible. He has not readjusted his work in order to cope successfully with the conditions of the times. He has not specialized in the one field in which his training makes him supreme. He has opposed this specialization. He has been stubborn. Other forces have bent him—and in his own speciality he stands still. His progress has been in directions where others can give better results.

His energies have been so much given to maintaining his business footing that he has neglected his art. Under these conditions the practice of architecture must remain a business, artistically uncreative and stagnant.

The industrial world looks to the architect as the man best fitted technically to assemble the complex materials of a modern structure into a harmonious whole. His success or failure is gauged by the results obtained in his finished product. To be thoroughly successful this product must show the highest efficiency in all its parts and at the same time be aesthetically satisfying. When the architect has arrived at this result he has accomplished his mission.

Modern Methods.

Under the pressure and specialization of modern practice he is not achieving the results expected of him. His methods are not harmonious. He is not maintaining the proper balance between the component parts of his work. His energies are diverted from their proper channels. He is devoting an undue proportion of his talents to business, engineering and mechanics, and the æsthetic side of his work for which he is best fitted is being neglected.

The architect foolishly believes that this programme is necessary in order to maintain his position as an artist. In reality it is having the directly contrary effect. The only way in which the architect can regain his position in the arts is by recognizing the modern tendency of industry, and by being content to perform only that portion of the work in connection with building for which he is adequately equipped. The best results will be obtained if the architect recognizes

this evolution and readjusts his work and his duties accordingly; but with or without his consent the change will come, and architecture will again become an art in spite of him.

A Socialistic Tendency.

It is not my purpose to argue for or against this industrial evolution; but no unprejudiced observer can deny its tendency. Rightly or wrongly, all signs point one way. This way is socialistic: but the men who are mainly responsible for the tendency are not "doctrinaires." They are the "captains of industry." They would be the last to admit that they are the forerunners of the co-operative commonwealth, and yet to the socialist they are the living proof of his doctrine.

The formation of every trust, every trade and labour union, every society of professional men, and every combination of employers tells but one story. These combinations are in turn subdividing, each subdivision working in its own speciality and having its own organization, but maintaining its affiliation with a central body.

The age of individualism is fast becoming a memory. Men are combining not for individual but for co-operative effort. The conduct of the business of architecture follows this socialistic tendency as to organization but not as to specialization. The work is specialized but within itself. It is co-operative; but the technical and strictly architectural speciality and the executive speciality are both centred in the architect. The executive speciality requires constant and prompt attention. Its demands must be instantly met. Its powers cannot be delegated to others. The architectural speciality needs quiet and tranquillity, and under the pressure of modern business it becomes physically impossible for one man to attend to both. The result is obvious. The tranquil state is not reached. The architect devotes his energies to his imperative duties.

The Architect of To-day.

The busy architect of to-day does not draw, he does not design; the purely commercial interests of his work occupy all his time. The client usually demands careful and personal supervision of his finances as paramount to any other consideration, and at most the busy man finds it barely possible to make the roughest kind of sketches which he turns over to his draughtsman for further elucidation. When the design is finished he signs his name as architect—but the individual touch of the artist is usually not there, and, if there, it is only the voice of the architect but the hand of the draughtsman.

The modern architect's office is one vast machine, in which the work is subdivided into many departments. Architectural firms have grown out of this condition, and their formation is generally consequent upon the necessity of making combinations of specialists to the end that the firm may be able to handle the complex problem of modern construction. One man is the designer, the second may be the engineer, and the third the business man. Even then they cannot cover the whole field, for their draughtsmen, too, have become specialists. In some cases a draughtsman becomes a managing clerk; others are designers; some simply trace, others attend to construction. A well-organized office has a specification writer and specialists in heating and electricity, as well as outside superintendents and book-keepers. In fact, the business of a large firm with an extensive practice is as complicated in its machinery as a department, store, but with this difference, that the department store has a manager whose sole business it is to manage. The manager has a specialist under him in each department, and he makes no pretense to special knowledge except in the executive department. If the architect is satisfied that architecture should remain a

business, this method is logical. If he persists in proclaiming himself an artist he should give up the management of this complex machinery to others trained for the purpose.

The New Conditions.

Under the conditions which obtained in the past the architect could fairly assume that he was competent to grapple with the business problems incident to his work and still maintain the proper relation between his business and his art. His training in the schools still teaches him that he should be considered first and foremost as an artist—and in these schools the proper balance is maintained between the strictly architectural and the business side of his profession. The men responsible for the curriculum realize that an attempt to teach modern business methods would carry it far beyond the domain of academic training. They assume for the purpose of this training that old conditions still obtain. Under these conditions it was possible for the architect to be the master-builder and to assume that he was an expert in all the building crafts.

To-day the architect cannot honestly assume this position. Construction has become too complicated. His knowledge must be superficial, and in his effort to assume a preponderance of exact information in all of the works over which he presides, he finds that he is outstripped by the experts working under him. If he continues to attempt to hold on to the powers and authority that he has exercised in the past there is no hope for the architecture of the future.

He cannot produce his work as a commercial commodity and at the same time be an artist. The dealers in this commercial commodity will always need the artist. They realize that beauty has a commercial value, and in no other age has the average man been so willing to expend his wealth for the purely beautiful. There have been popes, kings and emperors who have been patrons of the arts in a larger measure than any individual of to-day. But now the people are interested. They may be interested because it pays—but they are interested. The architect cannot satisfy that interest; he cannot give the best he has in him while his time is consumed by the multiplicity of details which modern practice demands of him.

American Work.

The result of this tenacious holding on to an obsolete programme is visible in much modern work, and particularly in American work, where the strain is greatest. The American nation has made no advance whatever towards the creation of a national style. When it wishes to build a beautiful tower a Spanish monument is copied; when a modern clubhouse is to be erected the design of an Italian palace is enlarged and fitted to the new conditions. American architects have worked Vignola to death—but they have not solved the modern problem. What encouragement is there to the younger workers when they see the *doyens* of their profession, the men who are accepted as types of successful practitioners, willing to rest their reputations upon good copies of ancient works?

These old and beautiful examples of the art of the past were the results of the application of an artistic spirit to the needs of the time. They were the outgrowth of a system which left the architect time to give his work creative study. They answered the problem. The architecture of to-day under pressure of the industrial system has degenerated into copying. It is good architecture only as far as the copying is judicious.

On the business side of his work the architect has been trained to believe that he would have a free hand. He actually finds himself bound by hard and fast limitations. He expected to be employed by an indi-

vidual—his client is more often a firm or corporation. He was to seek the co-operation of many individuals, who in turn would employ the units which would cause his design to become a concrete thing. He actually finds a few corporate interests, with whom he must deal under definite conditions, which in turn deal with other combinations of men through trade organizations and labour unions. Circumstances may make it advisable that he should avoid the larger corporations in seeking to have his client's work performed—but even then he finds his liberty of action hemmed in on all sides by combinations of both employer and employee. He can carry out no work for his client unless he deals with these combinations. Under the simpler constructive methods of the past the architect dealt with a few trades; he now finds that he must deal with hundreds; and each unit is simply a part of an organization which refuses to do business except under co-operative conditions.

Building Corporations.

By far the largest number of building operations of importance have as their controlling interests corporations formed for the purposes of building or holding real estate, or professional real estate operators who are thoroughly trained in finance. They know to a nicety just what their building properly demands. They have figured out the rentals and running expenses minutely, and they are perfectly familiar with the commercial value of their product and of all of its component parts. They need the architect to solve successfully the commercial problem on the basis of definite data and to inject into the scheme the utmost amount of beauty consistent with its solution. These corporations cater to the private owner as well as the business firm, and palatial dwellings are now procurable by the home-seeker ready made.

In the past a wealthy client would have carefully considered every detail of the plan of his new home—his entire family would have been consulted at every step. To-day he can find dwellings offered for sale ready for occupancy in fashionable neighbourhoods, thoroughly suited to his requirements, constructed with due regard for the most fastidious taste, and containing every possible mechanical appliance known to modern construction.

The heads of the corporations who control these large operations have absolutely no need of the architect in the financial management incident to their schemes. Once having the technical data complete in the form of drawings and specifications, these men, skilled in finance, are infinitely better equipped to consummate monetary deals than the architect, provided that no changes in construction or design are made without the architect's approval, where he alone is in a position to judge of the limitations of any portion of the work.

The changes in the methods of building have made these corporations an indispensable part of the modern business system.

In order to meet the commercial demand of the age time is an essential. One year's loss of rentals frequently means financial disaster. Attempts are made, wherever possible, to construct buildings between rental seasons; and whereas under the older methods it was generally sufficient for the client to engage the architect at a time almost co-incidental with the construction of his building, in many cases the architect is now called in months before the property upon which the improvement is to be made is even purchased. In fact, the services of the architect are essential at the very inception of the scheme as a business venture. The interested parties must have a definite statement of the possibilities of the land placed before them prior to their decision to proceed.

Economical Building.

There are but two ways open in our large centres of population by which a finished building can be produced in a sufficiently economical manner to compete successfully with its rivals. Both of these methods involve using the forces of co-operation to the fullest extent to which they have been carried in practical everyday methods. The economy of one method over the other is purely a question of the importance of time. One is to deal directly with the great building corporations, with their complicated machinery well regulated and in running order. The other is to form a temporary corporation for the particular project, which, although saving large sums of money, must necessarily involve slower methods due to lack of experience.

The method having been decided upon, the business problem thus presented to the modern architect can be solved only in one of these two ways; both centering around the corporation and leading in the same direction, but one starting from a more progressive stage than the other. The old method of calling for competitive tenders from four or five contractors, who would in turn farm out the work to many sub-contractors, is no longer an economical success.

There is no middle course between these corporation methods, and the sharp competition of modern industry has brought about a tendency to eliminate a portion of the competitive system itself so as to save the profit of the middleman.

The modern structure has also become specialized, like all other products of modern industry. In the preparation of the preliminary scheme for a new project the architect frequently finds a large amount of special knowledge necessary, for which he must consult other parties. If it is an office building, a block of flats or a hotel he must familiarize himself thoroughly with local rental conditions—information which can be obtained only from a specialist in the neighbourhood in which the building is to be erected. If a private dwelling, he must know the habits of the family for which he builds; and if a factory or business premises, complete familiarity with the methods of the particular business or manufacture is absolutely essential to success. The impossibility of grasping all of this knowledge is recognized in the trend of modern practice. Men have become experts in theatres, flats, interior decorations, breweries, mills and other classes of buildings, and our large cities have architects on their lists who rarely go outside of their particular specialty and who frequently act in a consulting capacity to the decreasing number of general practitioners.

Construction.

The exacting demands made upon the modern architect are the natural consequences of the complication due to methods of construction. Nowhere is this more apparent than in the fourteenth edition of "Kidder's Architects and Builders' Pocket-Book," where, in explanation of the enlarged size of the new volume, the author states that "at the time the first edition was issued architectural engineering had not been used in its present application, and the term 'structural engineering,' when used, referred almost exclusively to bridge work."

"To-day structural and architectural engineers are concerned almost exclusively with building construction, and their work is more closely allied to that of the architect than to that of the civil engineer; hence the author has had in mind the needs of the structural engineer and draughtsman, as well as those of the architect and builder, and the book should be of nearly equal value to both."

These modern methods of construction

demand of the architect an amount of exact technical service far in excess of that required of him under former conditions. The corporation must have much more exact preparation than the private client required, as it usually demands that all of the material be prepared, fitted and stored before actual construction is started on the site.

More Drawings Required.

...This system has multiplied and concentrated certain services required from the architect many times. Before the first spade of earth is turned he has frequently worked many months in carefully preparing the drawings and specifications of every detail, so that all portions of the work may be started in the various shops at the appointed time.

High taxes and high-priced property demand that each day shall count. Co-operation and specialization have caused the actual output of drawings required from the architect to be increased manifold. Formerly about four or five sets of scale drawings were prepared, and a similar

number of general specifications prior to the work being started. All the details of construction were made as the work proceeded. To-day the architect is expected to reproduce his scale drawings thirty and forty times, and to divide the specifications with the ultimate amount and minutiae, separating them for the various trades, so that some thirty specifications may become necessary, besides the frequent reproduction of all details, prepared far in advance of even the beginning of actual construction. The securing of low tenders to perform the various parts of the work is ensured thereby, and the middleman whose habit it was to guess at the cost of some intricate piece of detail finds that he and his guess are not wanted. The manufacturer of the commodity to be supplied is satisfied with nothing but an accurate full-sized drawing. Wherever these details include the work of several contractors copies must be distributed to the various interested parties as often as the work of each contractor is shown thereon.

Superintendence.

The system of dealing with a large number of workers and having the material completely prepared beforehand requires much more accurate and continuous superintendence than was formerly needed, much more thorough inspection than can be obtained by the occasional visit which the architect is supposed to give. Superintendence as defined in the schedule of the American Institute of Architects is totally inadequate. In fact, to secure proper results it must be continuous, and this is so keenly realized that the clerk of the works has become the rule rather than the exception on all large operations.

Trades-Unionism among Architects.

The architect recognizes the encroachment of his business upon his art; but he has not moved a finger to protect the position which he claims to value. His efforts are purely for business protection. He recognizes the co-operative tendency in his professional association, but mainly for the purpose of upholding professional fees and regulating practice. In England and the United States the Institute of Architects performs the same function as a trades-union. It attempts to level the compensation at least not below the minimum wage, but it is not as altruistic as the trades-union, as the schedule provided is for minimum compensation and its power over its members is not as great. The Institute has set a precedent, but it is not a positive force. In other respects in his professional association the architect refuses to admit that he must change his position, and combats all efforts by others to make the change.

Full Control for the Architect.

The National Convention of the American Institute of Architects, held in Cleveland last year, promulgated the new doctrine that it was unprofessional for an architect to assume to design work without having complete control of its construction. The Institute refused to recognize that under modern methods this supervision should be within limits which would allow the designer to devote the proper proportion of his time to the artistic creation of his design.

Registration Opposed.

Legal enactments in several States requiring the architect to secure a licence have recognized the increased technical responsibilities placed upon the modern practitioner, but these acts have been frequently opposed by the leaders in this most influential of professional associations on the ground that architects were artists and that art could not have its fullest development under legal restrictions. Paradoxically, this same influence has resisted the attempt of the Government to remove some of the technical and business burdens, presumably upon the ground that fees would be reduced accordingly. The logical position would have been to accept the proposition, but to insist that the fees now paid should not be reduced in view of the much larger service required under modern methods.

The Architect is the General of Division.

While the architect is wondering what is to be done—bemoaning his dethronement from the position which he formerly occupied in the arts—his status is being fixed by the building corporation, at the head of which is an executive specialist eager to obtain the best results from each one of the component parts of the great machinery under his control. These great corporations—these department stores of the building industry—are fixing the architect's status anew; and although the process may seem harsh to the profession, this tendency will ultimately cause the architect to be again recognized as an artist. The executive specialist knows the intricacies of building. He realizes keenly just where the architect is an indispensable part of his programme. He confines the

architect to his specialty just as he confines his business and financial managers to theirs. In a supervisory capacity he requires the architect's service only to a limited extent. The executive head of the great corporation is the commander-in-chief; the architect is the general of division—the technical and artistic division and in this division the architect has his engineering, sanitary and electrical experts, all responsible to the commander through the architect. In the details of their specialty they are supreme, provided they do not encroach upon the limitations of the other specialists or interfere with the general scheme.

It is the architect's duty to keep each specialist within his limitations, and the architect himself must bow to the same inexorable laws. His principal value in the realm of supervision is as an advisor. In the complicated construction of modern work the professional electrician, the heating and ventilating engineer, and the many other specialists whose work contributes to the finished product must each be left to attend to his own details. The architect cannot be expected to master the intricacies of their work, of which they are the most competent judges if kept within their proper sphere.

The architect is needed to supervise upon

his own initiative only as far as the finished product is concerned. The obtaining of estimates, preparation of contracts, the mass of correspondence and other details consequent upon the erection of a great building, together with the vast business interests of the work, are supervised and managed by the corporation directly through its well-oiled and experienced business machinery.

This is the System of the Future,

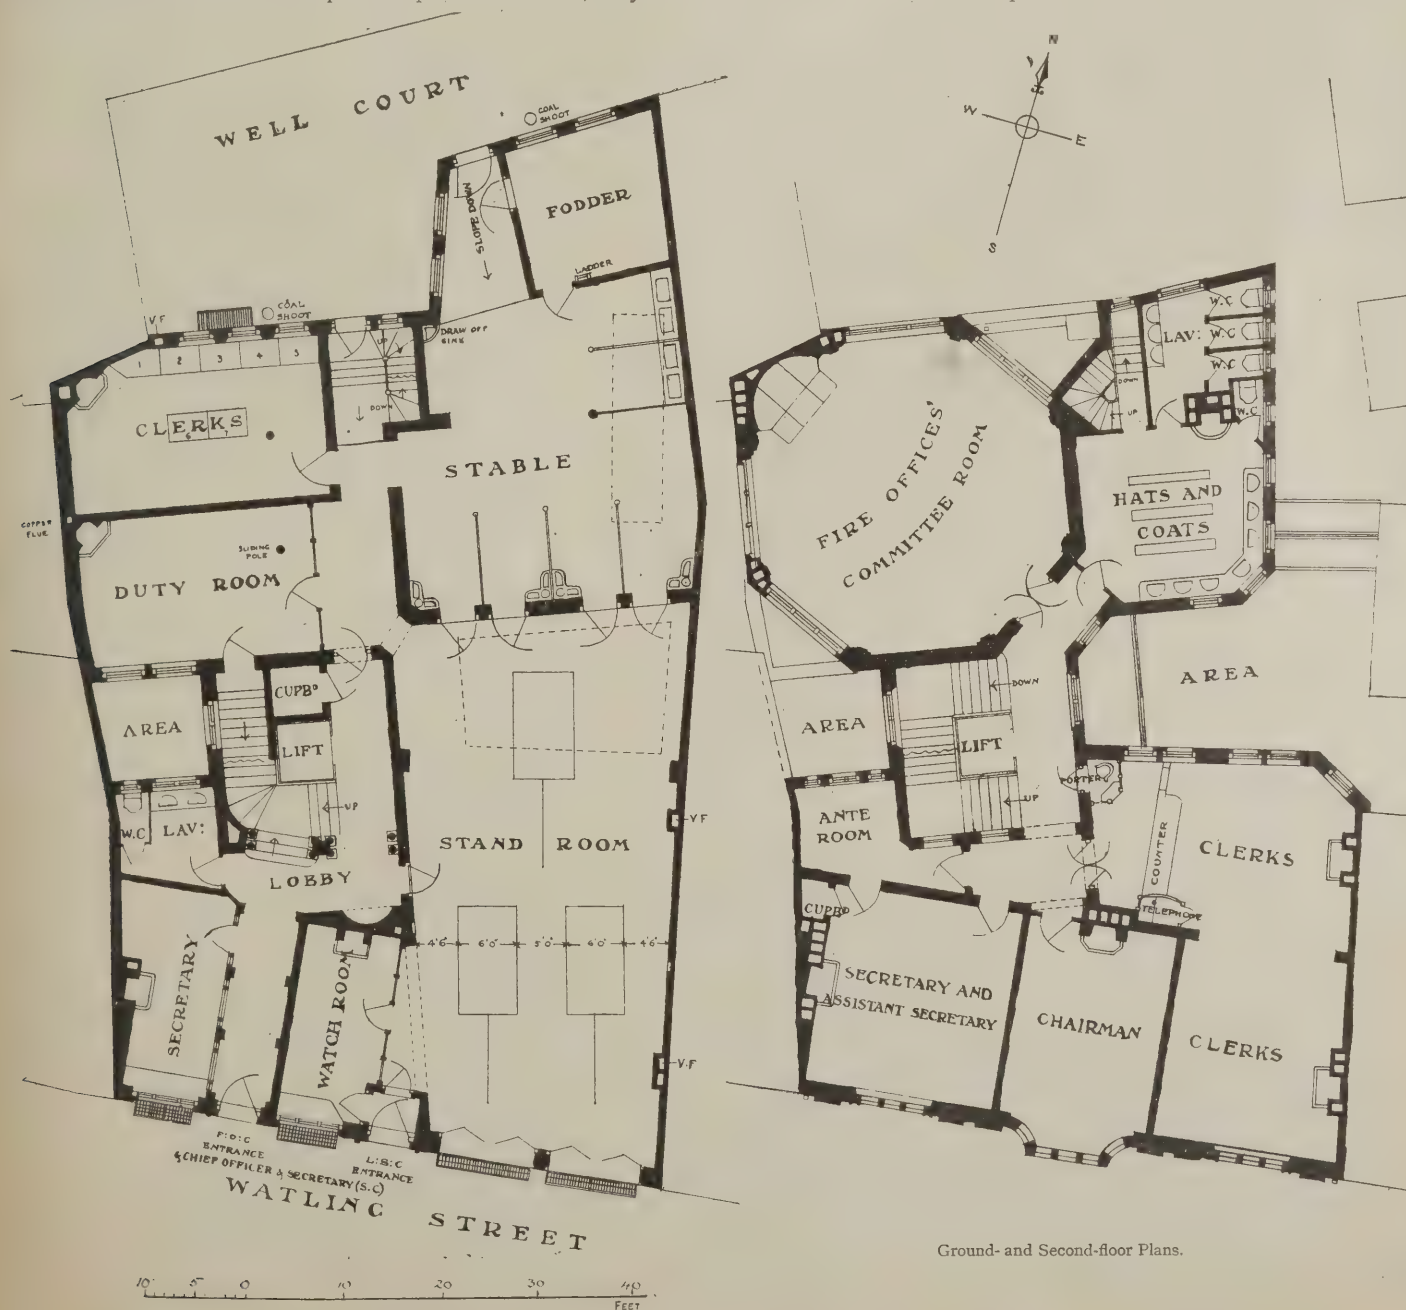

in some cases of the present. Under its influence the architect will again be left time to design, to plan, to draw, to give the best results in the specialty for which he is properly equipped—in fact, to be an architect. His power will not be as great as under the older system, but he will be an artist and will accomplish his mission.

There is no use in bemoaning the conditions which have caused this decadence of the most ancient of the arts. Architecture never created a civilization. Its monuments are the answers to that civilization's needs. Its lasting monuments are its successful answers, created under conditions which allowed of the putting forth of the best efforts of the designers. Other conditions now confront us; from them there is no appeal. They are fixed; they all tend in one direction.

How will architecture live as a vital artistic force under the new conditions unless it obeys the industrial law?—*Architectural Record*.

SALVAGE CORPS BUILDING.

THE proposed new building of the London Salvage Corps, here illustrated, is intended to occupy a site part of which is identical with its present premises. A large portion of the ground floor is necessarily occupied with the stand room for the Salvage Corps "traps." At the rear are the stables. The basement is mostly taken up with accommodation for the men of the Salvage Corps, who also have a large dormitory on the mezzanine, from which there will be an approach to the watch-room by a sliding pole. In the upper portion there is a residence for a chief officer, as well as accommodation for three married men. The second and third floors are taken up by the rooms for the Fire Offices Committee, who will have on the second floor an octagon-shaped meeting hall with ceiling of convex form. The exterior elevations will be entirely of Portland stone. The design of Mr. Paul Waterhouse was selected in a limited competition.

Ground- and Second-floor Plans.

Complete List of Contracts Open.

DATE OF DELIVERY.		WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
BUILDING :				
Aug.	31	Barley—Fittings to Stores	Barley Co-operative Society ...	H. B. Buckley, Architect, 85 Commercial Street, Batley.
"	31	Bridgend—Library	Free Library Committee... ..	P. J. Thomas, Architect, Station Road, Bridgend.
"	31	New Romney, Kent—Re-slating Roof of Town Hall	Town Council	Borough Surveyor, New Romney.
"	31	Wolverton—Schools	Education Committee	Clerk of Works Education Offices, Aylesbury.
"	31	Ynysybwl—Chapel	Building Committee	W. W. Lewis & Morgan, Architects, Market Street, Pontypridd.
Sept.	1	Merthyr Tydfil—Alterations to Schools	Guardians	T. Roderick, Architect, Clifton Street, Aberdare.
"	1	London, N.—School	Finchley U.D.C.	W. G. Wilson, Architect, 5 Bloomsbury Mansions, Hart Street, W.C.
"	2	Burnopfield—School	Urban District Council	A. W. Kyle, Architect, Burnopfield, R.S.O.
"	2	Taibach—Council Offices	Gas Co.	J. Cox, Surveyor, Port Talbot, Wales
"	2	Berkhamstead—Retort-house	City Council	A. F. Phillips, M.I.C.E., 38 Parliament Street, London, S.W.
"	2	Exeter—Dwellings	County Asylum Committee	City Engineer and Surveyor, Exeter.
"	2	Exminster—Cottages	Town Council	E. H. Harbottle, County Chambers, Exeter.
"	4	Kew—Convenience	Urban District Council	Borough Surveyor, Town Hall, Richmond.
"	4	Ramscombe—Farmhouse... ..	Gas Co.	H. A. Hosking, Architect, Landrake, St. Germans, Cornwall.
"	4	Norwich—Asylum Extension	Corporation	A. E. Collins, City Engineer, Guildhall, Norwich.
"	4	Castlewellan, Ireland—Houses	Trustees	W. H. Mills, Engineer, Amiens Street Terminus, Dublin.
"	4	Coventry—Meter-houses	County Council	F. W. Stevenson, Gasworks, Coventry.
"	4	Glasgow—Alterations	Lord Kensington	W. W. Lackie, Electrical Engineer, 75 Waterloo Street, Glasgow.
"	4	Rhymney—Chapel Alterations	Urban District Council	W. Jones & W. D. Morgan, Architects, Pentre, Rhondda.
"	4	Shepton Mallet—School	Corporation... ..	Mackay & Son, Shepton Mallet.
"	4	St. Bride's—Improvements to Mansion House	Great Western Railway Co.	J. Fergusson, St. Bride's, Littlehaven, South Wales.
"	4	Aberdare—Classrooms	H.M. Office of Works	J. Morris, Town Hall, Aberdare.
"	4	Sawbridgeworth—Fire-station	Corporation... ..	Council Offices, Sawbridgeworth.
"	5	Portsmouth—Library	Pembroke Estate Co.	A. Hellard, Town Clerk, Portsmouth.
"	5	Lye—Goods Shed	Education Committee	Engineer, G.W.R. Station, Wolverhampton.
"	5	Blackburn—Post Office	Great Western Railway Co.	Postmaster, Blackburn.
"	5	Aberdare—Houses	H.M. Office of Works	A. T. James, Hawthorne House, Gloucester Terrace, Aberdare.
"	5	Derby—Car-sheds Extension	Corporation... ..	J. Ward, Borough Surveyor, Derby.
"	5	Goodwick—Alterations	Education Committee	Jenkinson & White, 1 Princes Street, Westminster, S.W.
"	5	Newcastle-on-Tyne—Playshed	Great Western Railway Co.	A. Goddard, Education Offices, Newcastle.
"	5	Templeton—Station Buildings	Trustees	Engineer, Neath Station
"	6	Brynmaur—Alterations to School	Managers	H. Waters, Architect, Beaufort.
"	6	Pontypool—Alterations to Schools	Metropolitan Asylums Board	H. J. Griggs, Architect, Newport, Mon.
"	6	Rustington—Sun-room, &c.	Guardians	Rowland Plumble & Harvey, 13 Fitzroy Square, London, W.

Ynysybwl.—Accepted for alterations and additions to Zion English Baptist Chapel, Ynysybwl, for the Trustees. Messrs. Morgan & Elford, architects, 1, Jeffrey Street, Mountain Ash and Aberdare:—

Williams & Son, Ynysybwl ... £1,600

New Cavalry Barracks at Norwich are to be erected at a cost of about £200,000.

A new Roman Catholic Church at Stirling has been opened. The building, which was erected from plans by Messrs Pugin & Pugin, of London, is in the late Decorated style of Gothic architecture, having nave and side aisles, chancel and side chapels, &c. Red sandstone has been used in the construction of the church, the columns and arches in the interior being from Northumberland quarries. Six stone arches, with circular columns, divide the nave from the aisles. The aisle roofs are carried on arches which spring from a point low down on the aisle walls, and on the nave side rest on richly-carved stone corbels. The high altar is of Beer stone, with rouge marble panels and green Connemara marble columns. The side altar is of alabaster.

ROOFING SLATES:

Velinheli, Penrhyn, and Westmoreland.

SLATE SLAB GOODS:

Both Plain and Enamelled.

YOUNG ARCHITECT wishes to join another or artist, to share apartments, near City.—Particulars and lowest terms to Box 1316, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

MONTHLY

FIRE SUPPLEMENT

TO THE

BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

Edwin O. Sachs, F.R.S.Ed., Architect,
Consulting Editor.

Number 11.
August, 1905.

PARLIAMENT AND FIRE-PROTECTION.

ROYAL Assent was given to the Building Act Amendment Act of 1905 at the close of the session. The Act only deals with the question of escape from fire which formed the portion known as Part VIII. of the original Bill put forward by the London County Council. For reasons that it would be too lengthy to refer to here, all the other part of the original Bill presented was thrown out, including also certain fire-protective clauses which were of a constructional character, and which it had been anticipated would be dealt with at the same time as the Fire-escape clauses. It is to be hoped that the constructional fire-protective clauses will be brought before Parliament next session, as it is only with the aid of these or similar measures that it will be possible to reduce the fire risk of the Metropolis.

That that part of the Bill dealing with the escape from fire should have obtained Royal Assent as a separate Act is of course a step in the right direction. Although property owners appear to think that there will be a great hardship in meeting the requirements of the new Act, we anticipate that in actual practice the improvements will by no means be as serious or as vexatious as they anticipate, for the Act as it stands is sufficiently elastic, and there is, further, the usual method of referring to the Tribunal of Appeal, which should satisfy the most carping of critics.

It is our intention in a future supplement to deal with this Act at some length, but at the present moment we would only mention that the question of escape from fire as set forth in the Act not only refers to new buildings but is retrospective and deals with existing buildings. The great principle of retrospective legislation has been applied, and we think wisely applied in this case; and although many vested interests are naturally touched upon by such retrospective legislation, it is for the benefit of the Metropolis that such enactment should have been put on the Statute Book.

A feature of the Bill is the revision of the schedule of fire-resisting materials; this shows considerable improvement upon the existing schedule, but we think it will still require considerable modification upon a future occasion if it is to meet the results of actual experience and investigation. We think that all who were so actively engaged in the promotion of this section of the London County Council's Bill should have the congratulations and thanks of the community, for there are few measures that are of so much direct benefit to the welfare and safety of the community as the Amendment Bill which has just been passed.

THE INSURANCE OFFICES AND REINFORCED CONCRETE.

THE insurance companies as represented by the Fire Offices Committee have issued a guide to those using reinforced concrete, which practically means that the insurance companies have specified the conditions under which they will accept the risk of reinforced-concrete buildings from the fire point of view. While so much has been heard of this system of construction and its advantages, it has yet been apparent to those interested in fire-protection that there are certain grave risks in the application of reinforced concrete from the fire point of view, and although legislation has so far done nothing in the direction of safeguarding the owners and occupiers of buildings so constructed, it is only a question of time until special Bills must come into force on this matter.

In France and in the United States the rudiments of fire-prevention have been sinned against in the most callous manner by the firms connected with reinforced-concrete work, and it is we think only due to the propaganda in Great Britain on this point that more attention has been paid to this matter of late both in the United States and on the Continent. Notable warehouses in this country erected of reinforced concrete are distinctly of a very dangerous character, for the simple reason that the metal-work is not sufficiently protected by the concrete covering, and thus must be affected by heat and practically result in collapse if their contents were to get well alight.

With the new fire-insurance companies' rules, we think the metal-work in reinforced concrete will be suitably protected. We think that with the advent of the Fire Office Rules the ferro-concrete manufacturers will realize that the fire question will have to be seriously considered in this country, and the moment they thoroughly realize this, as has already been the case with one or two individual firms, the only one remaining disadvantage of the general application of reinforced concrete will be swept aside. It is in the interests of the reinforced-concrete constructors, in the interests of our cement industry, and in the interests of economical building that reinforced concrete should not be associated with any such disadvantage as that of neglect in respect of fire-resisting qualities, and all those interested in the advent of reinforced concrete must thus appreciate the fire offices' requirements and see in them a matter for congratulation.

As to the tenour of these rules, we present them in extract, and at the same time we think we should indicate at this point that

one of the leading French firms is at the moment preparing to demonstrate at the London testing station the fire-resistance of a reinforced-concrete floor if constructed in accordance with fire-protective requirements, the fire-test being with a floor measuring 15ft. by 22ft.

Rules as to Reinforced-concrete Construction.

Buildings constructed with concrete reinforced in every part with embedded metal rods, or bars spaced not more than 12ins. apart securely connected or overlapping at least 6ins. at all abutments and intersections, having also bands or bars across the thickness of the concrete, may be deemed of standard fire-resisting construction, provided they conform to the ordinary fire-office rules with the following modifications:—

Rule 3. Concrete may be composed of sand and gravel that will pass through a $\frac{3}{4}$ in. mesh, or of the other materials mentioned in the rule, but in any case the cement used must be Portland (equal to the British standard specification of December, 1904) in the proportion of 6 cwt. of cement to each cubic yard of concrete. The concrete must be thoroughly mixed both dry and wet, and must be rammed round the metal-work in position, every part of which must be completely enclosed with solid concrete.

Rule 4. No external wall to be less than 6ins. and no party-wall less than 13ins. thick in any part.

Rule 7. Flues may be built of reinforced concrete as described not less than 4ins. thick, if lined throughout with fireclay tubes not less than 1½ins. thick. No timber or wood-work to be in contact with such flue.

Rules 10 and 11. Floors must be constructed of reinforced concrete as described not less than 5ins. thick in any part without woodwork bedded therein, supported on beams and columns of similar reinforced concrete.

Rule 13. Roofs must be constructed in a similar manner to floors, the concrete in no part to be less than 3ins. thick.

Rules 14, 15 and 16. All structural metal-work must be embedded in solid concrete, so that no part of any rod or bar shall be nearer the face of the concrete than double its diameter; such thickness of concrete must be in no case less than 1in., but need not be more than 2ins.

Rule 22. Fireproof compartments in connection with reinforced-concrete structures must also be of reinforced concrete as described, with walls not less than 9ins. and floors not less than 5ins. in thickness.

Rule 18. Enclosure to staircase and hoist, if of reinforced concrete as described, may be 6ins. in thickness.

FIRE TESTS IN GERMANY.

By F. JAFFE, Crown Architect, Berlin.

(Free Translation from the German.)

At no time during the world's history has the battle for existence and possession been greater than it is to-day. Countless inventions are placed upon the market yearly, bringing with them innumerable dangers of a nature unknown or undreamt of by those who preceded us. Thus advanced civilization for the time being has to offer sacrifices, and the victims of electrical high-tension systems and of automobilism are our daily offerings to progress.

And yet genius strides through the world of to-day filling it with life and energy, and we who live in this twentieth century should be filled with pride and joy that we live in an epoch which aims at helping the needy, both morally and physically, to live a more useful and healthy life.

At no time in history has the sun of altruism shone as brightly as at present. The uniting of whole classes against a common enemy has never reached so high a standard as at the present time. Our aims generally are good and noble, and are to be commended more than ever, when the ideal and the practical stand on the same ground.

At the present day the protection of our neighbour against the dangers of fire is one of the important tasks of a civilized State, and in all countries of the world which claim to take part in the work of the civilization of humanity many busy and earnest men are making this their life-work. All are called to aid in a battle against the common enemy "fire," an enemy that lays waste our homes, our business premises, our beautiful buildings which adorn our cities, our factories, our theatres and our places of worship.

"Si vis pacem, para bellum!" (If you wish peace, be prepared for war!) Never was this Roman watchword more true than to-day, and it is only by increasing our methods of fire-prevention that we may hope to triumph. We must neither cease nor flag, for dangers come upon the scene in the shape of new inventions which must first be proved, and the necessity to test and test again our fire-preventive weapons becomes more imperative each day.

The efforts which were commenced in Germany to test the safety from fire of building construction date back some twenty years. The first scientific and practical tests on a large scale took place in Munich in 1885, Berlin followed in 1893, and Hamburg in 1895. Further tests and experiments have recently taken place in Berlin and other places in Germany. All these tests aimed at obtaining materials and systems of construction to prevent fire and keep it within bounds. They also aimed at assisting to prepare building regulations and to improve existing ones. Charlottenburg, near Berlin, the centre of these tests, has now become the Technical Research Laboratory (recently transferred to Lichterfelde), whilst the recent work of similar institutions which exist in Munich, Karlsruhe, Leipsic and Stuttgart should not be overlooked.

A historical description of the individual tests is perhaps the best way to illustrate the gradual building up of German testing work and the results obtained.

Tests in Munich, 1885.

These tests, conducted under the direction of Professor Bauschinger of the Technical High School in Munich, were carried out with a view to ascertain whether cast-iron or wrought-iron supports were to be recommended as a durable construction, from a fire-safety point of view. These tests must be described as laboratory tests, but they were carried out in a most scientific manner.

The work under observation was:—(1)

Wrought-iron columns, (2) cast-iron columns, (3) pillars or uprights of hard-burnt bricks in cement. The tests were conducted in such a manner that the iron columns were laid lengthwise in an iron bed of fire, and the variations which took place in length and breadth were registered by means of apparatus erected at the side. The iron columns were then heated to 300 degs. and then to 600 degs. C., the temperature at which red heat commences. Water was then applied from the opposite side, as they become red-hot, in order to bring any cracks into prominence. Alloys (globules) were used to measure the temperature, which, according to experiments made, have the following melting points:—

1 of tin to 2 of lead	= 300 degs. C.
9 of lead to 1 of silver	= 400 "
3 of lead to 1 of silver	= 500 "
6 of lead to 4 of silver	= 600 "

The twelve tests which took place one after another on this occasion showed that wrought-iron columns, even under the most favourable circumstances, begin to bend under their weight at not quite 600 degs. C.; in any event, when they become red-hot bending is assisted and hastened by the application of water from the opposite side. No actual breaks or cracks were reported in connection with these wrought-iron columns; their power of resistance under heat was, however, proved to be practically destroyed.

The cast-iron columns showed a tendency to bend towards the fire, which was increased by the application of water from the opposite side, but this bend did not exceed a certain limit, and the column did not cease to carry a load even when cracks made themselves apparent. As they cooled they became almost straight again.

The supports which came out the best in these tests were those made of concrete, Portland cement being used. These absolutely resisted a fire of an hour and three-quarters.

An equally good test was obtained with bricks of cement-mortar, where only the plastering suffered.

The worst tests were those obtained with natural stones, such as sandstone, limestone, which became soft; argillaceous stones, which diminished and lost their power of holding together. No natural stone showed itself so proof against fire as Portland-cement concrete.

Fire Tests in Berlin, 1893.

In connection with the German Accidents Exhibition, held in Berlin in 1889, the Exhibition Committee had placed at their disposal by the Union of German Fire Insurance Companies a sum for prizes, to be spent in awards for specially good results in the sphere of fire-protection. In 1887 a terrible catastrophe occurred in connection with the fire which took place at the warehouse of the Berlin Warehousing and Forwarding Company. It therefore became

THE FIRST FIRE TESTS IN AN OLD BUILDING AT BERLIN (1893).

imperative to think of some means by which such fires could be avoided. The points to be considered in this connection were:—(1) Apparatus and arrangements for the prevention of fire; (2) materials and systems of construction which would lend themselves to the limitation of a fire; (3) appliances for the extinction of fire.

The testing of materials and systems of construction, as indicated in item No. 2, was of the greatest importance, and the jury appointed for these tests therefore decided that these trials should be as much in accordance with reality as possible, and that the competing fire-resisting ceilings, floors, staircases, doors, &c., should be built into a building which had to be shortly pulled down.

The different rooms of the structure tested were therefore fitted up as petroleum stores, drug shops, carpenters' shops and living rooms. In some of the rooms a large amount of timber was stored, which shortly before setting fire to the house was saturated with petroleum. For registering temperatures metals and alloys were used, which were applied to different points such as the ceilings, the floors and the protection around the iron columns. They were as follows:—

Cadmium with a melting point of - - - -	315 degs. C.
Zinc with a melting point of - - - -	412 "
Aluminium with a melting point of - - - -	620 "
800 of silver to 200 of copper - - - -	850 "
Pure silver - - - -	954 "
400 of silver to 600 of gold - - - -	1,020 "
800 of silver to 200 of platinum - - - -	1,190 "
400 of silver to 600 of platinum - - - -	1,460 "

In addition, "Seeger's melting cones" were used, with melting points of from 900 degs. to 11,410 degs. C.

The fire tests showed that the temperatures in the rooms destroyed by fire varied between 100 degs. to 1,300 degs. C., whilst the temperatures under the floors and between the iron columns and stanchions, and their respective protective coverings, always remained under 315 degs. C.

In order to test the durability of certain constructions when exposed to blows and sudden concussion, iron bars were used which rested free on wood supports and fell gradually as the wood burned away.

The above-mentioned tests took place under the direction of the late Chief Officer Stude, of the Berlin Fire Brigade, and his fire inspector, Reichel (now chief of the fire brigade in question), and representatives of the municipality, of the police and the fire insurance companies were present.

With each object the time it was under fire, the temperatures reached, and its state after the fire were recorded.

To go into detail as far as these tests are concerned would be impossible here, but the first prizes were awarded to the Aktien-Gesellschaft für Monierbauten, Berlin; the Gypsum Slab Manufactory of A. & C. Mack, in Ludwigsburg (whose partition slabs were afterwards made in England by Messrs. King & Co.), and to C. Schubert, in Breslau; whilst a number of diplomas were awarded to other well-known manufacturers.

Tests in Hamburg, 1895.

These tests were made in connection with the fire which took place in the warehouses situated near the docks in Hamburg, and the question was whether the principle of wrought-iron stanchions inside a building should be abandoned. The decision was in favour of maintaining the wrought-iron stanchions, but a fire-resisting protection was considered absolutely necessary, that the whole building may not be endangered owing to the failure of individual metal

supports. Another question raised in connection with these tests was whether the spaces between light lattice-girders or stanchions should be filled with cement so as to withstand the fire better. The question was decided in the negative.

It was necessary that the constructions tested should be the same, and that the load and tension should also be approximately the same as those in actual use. It was suggested to heat the columns by means of coke and wood firing, but gas was eventually used, as it enabled a better regulation of the temperature. As the protective covering to the iron proved so efficient against the melting of the metal, some experiments were also made with wooden supports of pine and oak with an outer covering.

The vertical supports were surrounded by an oven half their height, which had four burners on each side. The temperature was taken by means of a pyrometer put inside the oven, whilst a hydraulic press with a manometer indicated the pressure to which the column was submitted. At these tests the alterations which took place in the length and breadth of the columns were taken by means of appliances fixed on the sides of the columns, but independently of them.

In order to ascertain the exact effect which a protective covering had on the durability of the columns, the supports in question were surrounded by fire-resisting materials such as gypsum boards, xylolith plates, wood and sheet-iron plates, "cork-stone" and pumice asbestos plaster. All these materials were fitted in the shape of protective slabs built round the supports. The effective value of certain of these protective coverings was proved in these tests. Such coverings kept the fire from the iron construction in various ratios and protected the ironwork from blows and other disturbing influences.

TEMPORARY PLANT FOR TESTING STANCHIONS AT HAMBURG.

The tests with wooden supports showed that pinewood is more inflammable than oak, and that covering it with sheet-iron proved of use. The fact that wood only chars to a certain depth under fire led to the at that time surprising result that, under certain circumstances, wooden supports possess a far greater power of resistance against fire than unprotected iron ones, as the latter melt or bend and collapse under their load.

The Royal Technical Research Laboratory, Charlottenburg, Berlin.

The buildings in which the Berlin Institute originally made its name were erected in the year 1884 on the construction of the new buildings of the Technical High School, in Charlottenburg, near Berlin, and they were equipped with the most modern appliances and requirements for testing different materials.

The testing station is a public institution, supported by the state, and in addition to a director has a working staff of about 100 men. It is divided into four departments, each having its own superintendent; one of these departments is devoted to the examinations of building materials, and is entrusted with the fire tests. In this department constructional work can be tested in respect to strains, deflection, stability, breaking points and other technical qualities. The choice of test is on the whole left in the hands of those wishing to have material tested, but the Institution is always ready to assist those wishing to test and to advise them to their best advantage. A certificate of test is issued with each test and contains detailed criticism of the building material. It is usual to make several tests with the same material in order to obtain an average result.

Fire tests now form a prominent feature of this department for the examination of materials, and are mostly conducted in detached huts standing in the open or in specially-prepared stoves. The fuel used is wood, the huts erected have an area of about four square metres, and attached to them is a space set apart for observations, which is separated from the hut by a fire-resisting partition. Both spaces have a door leading into the open. The testing hut has openings for the introduction of pyrometers, and is supplied with a chimney. So-called laboratory tests are rarely undertaken by the institution. They are refused because the result of such small tests brings about unreliable results.

For the better observation of the material during and after the test it is preferable that it should be isolated rather than surrounded, as in the latter case it can only be observed by means of small openings. For the measurement of temperatures "Seeger's burning cones" have long been in use. These are hung free in small porcelain saucers in the midst of the fire. Their effectiveness, however, depends on the rapidity in the rise of the temperature. Sometimes they expand, and do not melt at the desired temperature; one is therefore compelled to have recourse to metal alloys. At the more recent tests undertaken by the Institution, the Le Chatelier's pyrometer has been used, the working of which depends on the thermo-element, the joints being platinum and platinum-iridium. The current produced by the heat is measured by means of a galvanometer made by Messrs. Siemens & Halske, Berlin. The appliances themselves are tested for their correctness at the Physical-Technical State Laboratory in Berlin. The testing laboratory in Berlin does not insist upon the automatic registration of the variations in temperature, as is the custom with the British Fire Prevention Committee.

Owing to the very numerous requests for tests by municipal authorities and private individuals, the accommodation of the Berlin Institution became insufficient, and it has

lately been moved to a new building in Lichterfelde, near Berlin, which is built in accordance with the latest and most advanced views so as to be able to adequately deal with the tests to be undertaken.

The experiences gained by the tests in Berlin and Hamburg led the Technical Research Laboratory to institute a number of fire tests with unpatented materials, *i.e.*, non-proprietary work, at the instigation of the Royal Berlin Police. Recent tests have dealt mostly with cement, plaster, &c., in the form of walls and ceilings for inner decoration, but fire-resisting wired bricks and various limestones have also been included. All these tests were conducted in the huts before described.

The Berlin Fire Exhibition and other Tests.

With the assistance of the officers of this laboratory a number of tests were undertaken at the International Fire Exhibition in Berlin in 1901. Here, as in earlier experiments, ceilings and partitions showing a combination of metal and concrete (cement or plaster) were mainly under consideration.

Karlsruhe Tests, &c.

Similar experiments were carried out in Karlsruhe in 1903 with wood and stone stairs, doors, asbestos, piers of brickwork, plaster-boards and cork sheets, wire-glass and impregnated wood. Similar experiments were also carried out in Leipsic, Munich and Stuttgart with ceilings, plate-glass and electro-glazing.

Conclusion.

Fire prevention has made great strides in Germany. A number of excellent inventions have been introduced, and these have been carefully and scientifically investigated and independently tested. The interest awakened is very great; new industries have sprung up, and municipalities, insurance companies, fire-brigade associations, architectural and engineering societies are all taking their share in the work.

I consider that the results of these experiments have been of the greatest possible influence and benefit to our German building regulations. I consider that the tests that have been undertaken have materially assisted in the reduction of the risk of fire in many of our buildings, and that with the aid of the results of these tests and with future investigation of a like character we can look upon the future development of fire-prevention and the safety of life and limb with greater equanimity than before.

I consider that the tests which have now been conducted for some twenty years in Germany have not only been of benefit to Germany but of considerable benefit to other countries, inasmuch as the recognition accorded to earlier scientific experiments conducted in Germany led to these investigations being taken up in other countries. Germany is proud that in scientific research work of this kind she works hand in hand with other civilized countries, united in the unanimous endeavour to protect life and property from fire.

The fight which is now being made in all countries against fire is rapidly growing, and a continuous interchange of information and results should hence be encouraged between the different countries.

It is well that in this age of political ambitions and strife there should be an international centre, where mutual work can be carried on peacefully for the benefit of humanity and the benefit of all nations, such as we see to-day in London in the British Fire Prevention Committee's organization, a centre which bids fair to become a permanent international institution.

Mr. Ellis Marsland, district surveyor, has been elected an hon. member of the Luxembourg Fire Service Union in recognition of his work in the interests of fire-prevention.

CHICAGO'S NEW BY-LAWS.

Extracts from the new Building Ordinance adopted by the City of Chicago on March 13th, 1905.

Classification of Buildings.

53. (Buildings.—Classes of.)—All buildings (other than sheds and shelter sheds, as herein-after described) now existing or hereafter constructed, altered or enlarged within the city shall be classified as follows:

54. (Class I.)—In Class I. shall be included every building used for the sale, storage or manufacture of merchandise, other than department stores, as described in sections 60 and 70 of this ordinance, and all stable covering or occupying a ground area of over 500 sq. ft.

55. (Class II.)—In Class II. shall be included every office building, hospital and every building used for hotel purposes or for boarding or lodging-house purposes where such building so used for hotel or boarding or lodging-house purposes is occupied by twenty or more persons.

56. (Class III.)—In Class III. shall be included every building used as a family residence, also every building used for stabling purposes where such building so used shall occupy a ground area of less than 500 square feet.

57. (Class IV.)—In Class IV. shall be included every building used as an assembly hall, whether such hall is used for the purpose of worship, instruction or entertainment, unless such building is used for any of the purposes for which buildings of Class V. or Class VIII. are used.

58. (Class V.)—In Class V. shall be included every building which is used as a public theatre where an admission fee is charged and in which movable scenery is used; provided, however, that public halls and club halls with a seating capacity of less than 600, although occasionally used for theatrical representations, shall not be constructed to be public theatres within the meaning of the term as used in this section, notwithstanding the fact that movable scenery is used upon the stage therein on such occasions, and such public halls and club halls shall not be considered as buildings of Class V. as herein defined. Such public halls and club halls shall be included in Class IV. as defined in sections 57 and 400 of this ordinance.

59. (Class VI.)—In Class VI. shall be included every tenement and apartment house; that is to say, any house or building or portion thereof, which is used as a home or residence for two or more families living in separate apartments.

60. (Class VII.)—In Class VII. shall be included all buildings used for the sale at retail of dry goods and other articles of general merchandise and commonly known and described as "department stores."

61. (Class VIII.)—In Class VIII. shall be included every building used exclusively for school purposes.

62. (Buildings used for the Purposes of more than One Class.)—Where any building is used for the purposes of two or more classes as herein specified and defined, such portion of any such building as is devoted to the uses and purposes of any particular class shall be constructed, operated and maintained in accordance with the requirements of this ordinance relating to such class, unless such construction shall prove impracticable or unless there would be a conflict between the provisions of this ordinance relating to the construction of buildings; in either of which such cases the provisions relating to and governing the construction of buildings of the class requiring the best and safest form of construction shall govern.

63. (Conflict between Special and General Provisions.)—Whenever any provision or requirement of this ordinance relating specifically to the construction, equipment, maintenance or operation of any building or part of a building used for the purposes of any specified class shall conflict with the general provisions of this ordinance relating to the construction, operation and equipment of buildings generally, the special provisions shall govern in each case.

102. (Buildings.—Height and Construction of.)—Buildings of Class I, which are roof or more in height shall be built entirely of fireproof construction.

Buildings of Class I, less than roof, and more than 60ft. in height shall be built entirely of slow-burning, mill or fireproof construction.

No building of Class I, more than five storeys in height shall be permitted to be built of ordinary construction.

104. (Walls.—Metal, Lath and Solid Cement Plaster Covering.)—A one or two-storey building used for the purposes of Class I, no part of which is within 20ft. of any lot line, alley line or street line, having a complete self-supporting steel-frame consisting of wall columns supporting steel trusses, with steel trusses and steel diagonals designed to resist safely within the safe limits of stress provided by this ordinance a wind-pressure of 30 lbs. per square foot for each and every exterior surface exposed to the wind, in addition to the dead weight of the completed structure, and in addition to the live load of 100 lbs. per square foot provided for by this ordinance, and any other live loads which may be imposed on said structure, may have exterior walls measuring not less than 1 1/2 ins. thick of metal, lath or metal fabric plastered on both sides with a mortar consisting only of Portland cement and torpedo sand. A complete reinforced concrete framework built in every manner equally as strong and as safe as provided for a steel frame in this section may have exterior walls built in the same manner of the same materials and of the same thickness.

202. (Buildings.—Construction of.—Height of.)—Buildings of Class II, which are roof or more in height, shall be built entirely of fireproof construction.

Buildings of Class II, less than roof, and more than 60ft. in height shall be built entirely of slow-burning or mill or fireproof construction. Buildings of Class II, not exceeding four storeys in height and less than 60ft. in height may be built of ordinary construction.

General Provisions for Fireproof Construction.

900. (Fireproof Construction.)—In cases in which it is claimed that any equally good or more desirable mode or manner of construction, or material, or device for fireproofing other than specified in this ordinance can be used

in the erection or alteration of buildings, the commissioner of buildings, upon written application to him for a permit to use the same, shall have power to appoint a board of examiners consisting of not less than three nor more than five members, each of whom shall have had at least ten years' experience in Chicago as an architect, engineer or builder, who shall take the usual oath of office. The said examiners shall adopt rules and specifications for examining and testing such mode or manner of construction, or material, or device for fireproofing, and furnish a copy of the same to the applicant. And said specification shall provide for a comparative fire test of not less than four hours and for a period of at least two hours an average temperature of 2,000 degs. Fahr. shall be maintained. At the end of this test water shall be applied to the construction through a $\frac{1}{2}$ in. nozzle under 60 lbs. pressure for five minutes. All expenses of such examiners and of such examinations and tests shall be paid by the applicant, and said examiners may require security therefor.

The said examiners shall, after such examination and tests, certify the results, and their decision on the said application to the commissioner of buildings, who shall have power, in the event of the examination and tests being satisfactory, to grant a permit to the applicant in accordance with such decision of the said board of examiners. A complete record of the proceedings and all acts and decisions of the said board of examiners shall be kept by the commissioner of buildings in his office.

The commissioner of buildings shall have the power to pass upon any question relative to the mode or manner of construction or materials to be used for fireproofing in the erection or alteration of any building or structure to make the same conform to the true intent and meaning of the several provisions of this ordinance.

901. (Fireproof Construction.—Definition of.)—The term fireproof construction shall apply to all buildings in which all parts that carry weights or resist strains, and also all exterior walls and all interior walls and all interior partitions and all stairways and all elevator enclosures are made entirely of incombustible material, and in which all metallic structural members are protected against the effects of fire by coverings of a material which shall be entirely incombustible, and a slow heat conductor, and hereinafter termed "fireproof material." Reinforced concrete as defined in this ordinance shall be considered fireproof construction.

902. (Fireproof Material.)—The materials which shall be considered as filling the conditions of fireproof covering are: First, burnt brick; second, tiles of burnt clay; third, approved cement-concrete; fourth, terra-cotta; fifth, approved cinder concrete.

903. (Concrete—Approved Cement.)—All approved cement-concrete shall consist of a standard Portland cement, torpedo sand, and crushed stone or gravel, or crushed blast-furnace slag, or crushed burnt clay: the volumetric quantity of any one of these materials combined with the torpedo sand shall not exceed nine times the volume of the Portland cement. All of the ingredients of cement-concrete shall be thoroughly worked and wet so as to cover each piece of stone or gravel or slag or burnt clay with moistened cement; and the cement and sand shall fill the voids between the coarse material of the cement-concrete. All cement-concrete to be considered a fireproof material shall be cast and rammed in an unset condition against the metal.

904. (Concrete—Approved Cinder.)—Machine or hand-pressed concrete bricks or blocks are not considered in this ordinance as a fireproof material for the protection of metallic structural members.

905. (Brick, Burnt Clay, Tiles, &c.—How Applied.)—Brick, burnt clay, hollow tiles, porous clay, solid tiles and terra-cotta shall be applied to the metal in a bed of mortar.

906. (Fireproof Covering.—Minimum Thickness of.)—The minimum thickness of fireproof covering on any metal shall be, if of hollow tile, constructed in such a manner that there shall not be less than one air space of at least three-fourths of an inch, by the width of the metal surface to be covered, within the clay covering; if of porous clay tiles, the covering shall be at least $\frac{1}{2}$ ins. thick. The minimum thickness of concrete covering any metal shall be 2 ins.

907. (Incombustible Materials.)—A metal or fire-resisting glass of not less than $\frac{3}{4}$ in. in thickness, or plastering, or plaster blocks, or stone or granite, or marble, or an approved cinder-concrete or one of the fireproof materials described herein shall be considered an incombustible material as called for by this ordinance.

908. (Concrete—Cinder—Floor-filling—Specifications for.)—Whenever the use of a cinder-concrete is permitted by this ordinance, such cinder-concrete shall be composed of the following named ingredients, in the proportion here described, to wit: 5 parts of clean, thoroughly burnt, steam boiler cinders, no particle of which shall be larger than $\frac{1}{4}$ in.; 3 parts of clean grit sand, or other parts of clean stone screenings, and 1 part of a standard Portland cement; the working and wetting of these ingredients shall be done in the same manner as required for cement-concrete in section 903 of this ordinance, and such a mixture of approved cinder-concrete may be used only for floor filling.

909. (Fireproof Covering—Measurements.)—In every case the thickness of the covering specified in this ordinance shall be measured from the extreme projection of the metal, unless otherwise provided herein.

Construction of Fireproof Buildings.

910. (Skeleton Construction.)—The term "skeleton construction" shall apply to all buildings wherein all external and internal loads and strains are transmitted from the top of the buildings to the foundations by a skeleton or framework of metal. In such metal framework the beams and girders shall be riveted to each other at their respective junction points. If columns made of rolled iron or steel are used, their different parts shall be riveted to each other, and the beams and girders resting upon them shall have riveted connections to unite them with columns. If cast-iron columns are used, each successive column shall be bolted to the one below it by at least four bolts not less than three-fourths of an inch in diameter, and the beams and girders shall be bolted to the columns. At each line of floor or roof beams, lateral connections between the ends of the beams and girders shall be made in such manner as to rigidly connect the beams and girders with each other in the direction of their length.

911. (Walls—Enclosing.)—If buildings are made fire-

proof entirely, and have skeleton construction so designed that their enclosing walls do not carry the weight of floors or roof, then their walls shall be not less than 2 ins. in thickness; provided such walls shall be thoroughly anchored to the iron skeleton, and whenever the weight of such walls rests upon beams or columns, such beams or columns shall be made strong enough in each storey to carry the weight of wall resting upon them without reliance upon the walls below them. All walls shall be of fireproof or incombustible material.

912. (Columns—Exterior.)—All iron or steel used as a

vertical supporting member of the external construction of any building exceeding 60 ft. in height shall be protected against the effects of external changes of temperature and of fire by a covering of fireproof material consisting of at least 4 ins. of brick or of 4 ins. of concrete, or of 4 ins. of burnt-clay tiles, or 4 ins. of hollow terra-cotta, or of a combination of any two of these materials, provided that their combined thickness is not less than 4 ins. The thickness of 4 ins. shall be measured from the extreme projections of the metal of the column proper.

Where stone or other incombustible material is used for

VIEWS SHOWING THE EFFECT ON CONSTRUCTIONAL STEELWORK OF A FIRE AT THE BREMEN DOCKS.

the exterior facing of a building the distance between the back of the facing and the extreme projections of the metal of the column proper shall be at least 4 ins., and this 4 in. space shall be filled with one of the "fireproof materials."

In all cases, the brick or burnt clay, tile or terra-cotta, if used as a fireproof covering, shall be bedded in cement-mortar close up to the iron or steel members, and all joints shall be made full and solid.

973. (Fireproofing of Exterior Sides of Mullions.)—In buildings required by this chapter to be of fireproof construction all vertical door or window mullions over 8 ins. wide shall be faced with incombustible material; horizontal transom bars over 6 ins. wide shall be faced with a fireproof or with an incombustible material.

974. (Spandrel Beams, Girders, Lintel.)—The metal of the spandrel beams or spandrel girders, or lintels of exterior walls, which support a part of exterior walls, shall be covered in the same manner and with the same material as specified for the exterior columns in this ordinance. The covering thickness shall be measured from the extreme projection of the metal in every case.

975. (Fireproof Covering Independent.)—All covering of brick, concrete, burnt-clay tiles, hollow terra-cotta or of a combination of any two of these materials shall be applied to all of the structural members of the exterior of a fireproof building previously and independently of the application of the architectural facing of such a fireproof building with an incombustible or fireproof material.

977. (Walls, Support and Fireproofing of.)—Where skeleton construction is used for the whole or part of a building, the enveloping material and the walls shall be independently supported on the skeleton frame for each individual story.

978. (Terra-cotta.)—If terra-cotta or other hollow blocks are used as fireproof covering they shall be backed up with brick or hollow tile or concrete; whichever is used shall be, however, of such dimensions and laid up in such a manner that the backing will be built into the cavities of the facing so as to secure perfect bond between the facing and its backing.

979. (Coping.)—The upper surfaces of all breaks or offsets in external coverings and fillings and walls, as well as the tops of walls, shall be covered with stone, terra-cotta, metal, concrete or fireclay copings set in cement-mortar. Copings of all kinds which do not have lapped joints shall be pointed with mortar composed of 1 part of standard Portland cement and 2 parts of torpedo sand.

980. (Columns—Interior.)—The covering of interior columns shall be one or more of the fireproof materials herein described.

If such covering shall be of brick or concrete it shall be not less than 4 ins. thick; if of burnt-clay tiles, such covering shall be in two consecutive layers, each not less than 2 ins. thick, with one air space; if of porous clay solid tiles, it shall consist of at least two layers no less than two combination of any two of these materials, one-half of the total thickness required for each of the materials shall be applied, of each of such materials. Whether hollow tile, porous tile or terra-cotta is used, the two consecutive layers shall be so applied that neither the vertical nor the horizontal joints in the same shall be opposite each other, and each course shall be so anchored and bonded within itself as to form an independent and stable structure.

In all cases the brick or hollow tile, solid tiles or terra-cotta shall be bedded in cement-mortar close up to the iron or steel member, and all joints shall be made full and solid.

In the case of columns having an "H"-shaped cross-section or of columns having any other cross-section with channels or chases open from base-plate to cap-plates on one or more sides of the columns, then the thickness of the fireproof covering may be reduced to 3 ins., measuring in the direction in which the flange or flanges project, and provided that the thin edge in the projecting flange or arms of the cross-section does not exceed 1 in. in thickness. The thickness of the fireproof covering on all surfaces measuring more than 1 in. wide and measuring in a direction perpendicular to such surfaces shall be not less than that specified for interior columns in the beginning of this section, and all spaces, including channels or chases between the fireproof covering and the metal of the column, shall be filled with a solid fireproof material. Lattice or other open columns shall be completely filled with approved cement-concrete.

922. (Columns—Wiring Clay Tiles on.)—Burnt-clay tile column-covering shall be secured by winding wire around the columns after the tile has all been set around such columns. The wire shall be securely wound around the tile in such a manner that every tile is crossed at least once by a wire. If iron wire is used it shall be galvanized, and no wire used shall be less than No. 12 gauge.

924. (Pipes enclosed by Covering.)—Pipes shall not be enclosed in the fireproofing of columns or in the fireproofing of other structural members of any fireproof building, provided, however, gas or electric-light conduits not exceeding 1 in. inside diameter may be inserted in the outer zincs of the fireproofing of such structural members.

Construction of Fireproof Buildings.

925. (Shafts, &c.)—In cases where a pipe, conduit, dumb waiter, table, wire, conveyor, belt or any combination thereof passes from one storey to another storey through an open hatch or floor opening, a shaft or enclosure of fireproof material shall be built from floor to floor around such hatch or floor opening in each storey above and below such hatch or floor opening in the same manner as described for fireproof partitions in this ordinance. The area of space thus enclosed shall not exceed the area of the hatch or floor opening by more than 100 per cent.

In no case shall any wood be used in the construction or support or fittings of such shaft as described above. If such holes in floors as described above in this section are not enclosed by such fireproof enclosures, then the open spaces in each floor opening not occupied by pipes, conduits, cables, wires, conveyors, belts or any combination thereof shall be filled solid with fireproof material not less than 8 ins. thick.

926. (Shafts, Partitions around, Plastering of.)—All burnt-clay or terra-cotta partitions or walls around shaft having openings in floors shall be plastered on the outside and plastered or pointed on the inside.

927. (Shaft, Doors and Windows.)—All doors, frames, sashes, casings and windows in partitions or walls around floor openings, or around stair shafts or elevator shafts, shall be built of incombustible material. The supports

of such doors, frames, sashes, casings and windows shall also be of incombustible material; in the case of doors such supports shall be of rolled structural metal extending from floor to ceiling and secured to both. Where there are brick walls of 12 ins. or more in thickness the supports need not extend to ceiling as above specified. All glass used in connection with such partitions or walls shall be fire-resisting. Sheet metal work pressed over asbestos paper and wood may be used for the openings in such partitions, except for elevator doors in shafts and where the provisions of this chapter require all metal doors.

928. (Beams and Girders, Coverings of.)—The beams and girders of the interior structural parts of a building shall be covered by one of the fireproof materials so applied as to be supported entirely by the beam or girder protected, and shall be held in place by the support of the flanges of such beams or girders and by the cement-mortar used in setting. If metal binding or metal anchors are used as fastenings of such fireproof covering, such metal binding or such metal anchor shall be protected by not less than 1/2 in. of fireproof covering.

If the covering is of brick it shall be not less than 4 ins. thick; if of hollow tiles or if of solid porous tiles, or if terra-cotta, each of such tiles shall be not less than 1 1/2 ins. thick, applied to the metal in a bed of cement-mortar; hollow tiles shall be constructed in such a manner that there shall be one air-space of at least 1/2 in. by the width of the metal surface to be covered within such clay coverings; the minimum thickness of concrete on the bottom and the sides of metal shall be 2 ins.

The top of all girders and beams shall be protected with zincs of brick or 1 1/2 ins. of burnt clay, or zincs of approved cement-concrete, or 3 ins. of approved cinder concrete. The brick or burnt clay shall be bedded solid on the metal in cement-mortar.

In all cases of beams or girders in roofs or floors, no matter what the material or form of the floor arch used, the protection of the bottom flanges of the beam and girders and so much of the web of the same as is not covered by the arches shall be made as hereinbefore specified for the covering of beams and girders. In every case the thickness of the covering shall be measured from the extreme projection of the metal, and the entire space or spaces between the covering and the metal shall be filled solid with one of the fireproof materials excepting the air-spaces in hollow tile.

929. (Girders and Trusses.)—All girders or trusses when supporting loads from more than one storey shall be fireproofed with two thicknesses of fireproof material or a combination of two fireproof materials as required for exterior columns in section 912 of this ordinance, and each covering of fireproof material shall be bedded solid in cement-mortar.

All other girders or trusses supporting only a ceiling or roof shall be covered with a fireproof covering as specified for beams and girders in section 928 of this ordinance.

930. (Cut-out Boxes, Chases, &c.)—No electric service cut-out box, switch-box, cabinet, chase or any other recess shall encroach on the minimum thickness required for any fireproof covering on structural metal, except as provided in section 924 of this ordinance. If the depth of any cut-out box, switch-box, cabinet or chase, or of any other recess, is to be concealed or partially concealed, then the thickness of the fireproof covering shall be increased correspondingly.

931. (Floor, Construction of.)—Brick, hollow tile, porous terra-cotta, or approved cement-concrete, or approved cinder-concrete, shall be used for the construction of floors and roofs of fireproof buildings. Flat arch hollow tile, or flat arch porous clay tile floor arches shall have a height of at least 1 1/2 ins. for each foot of span.

932. (Hollow Tile Flooring.)—Hollow tile flat arch floor construction having a thickness of only 1 1/2 ins. for each foot of span shall be used only for the minimum floor loads, and the area of burnt clay in the flanges, and ribs and webs of the hollow burnt clay tiles shall be proportioned to the safe value of resistance to compression of the materials used, in the most stressed areas of the burnt clay.

933. (Segmental Arches.)—Segmental arches shall have a rise of at least 1 in. for each foot of span of arch. The least thickness of a hollow tile or porous terra-cotta segmental arch shall be 1 in. per ft. of span, but no such hollow tile or terra-cotta shall be of a thickness less than 5 ins. Both flat and segmental arches shall be so constructed that the joints of the same radiate from a common centre, and there shall be a cross rib for every 4 ins. or fractional part thereof in height in each tile block. The skew-back of the arches shall be carefully fitted to the beams supporting them, and in addition to the cross ribs there shall also be additional diagonal reinforcing ribs in the skew-back. Such arches, whether flat or curved, shall have their beds well filled with cement-mortar, and the centres shall not be struck until the mortar has set. Burnt-clay skew-backs shall be moulded in such a manner as to support the burnt-clay covering on the undersides of beams or girders.

934. (Floors, Wood Surfacing and Nailing Strips.)—Wood-floor surfacing and wooden nailing strips for such wood-floor surfacing may be used in fireproof buildings.

Where wood flooring is used in a fireproof building, the space immediately under such wood flooring and between the wood nailing strips and under such wood-nailing strips shall be filled with a cement or a cinder-concrete tamped into place in an unset state, or such other incombustible material as shall be approved by the Commissioner of Buildings.

935. (Partitions in Fireproof Buildings.)—The partitions around stairs, stair halls, shafts, elevators or public lavatories shall be fireproof partitions, as described in section 936 of this ordinance; all other partitions in fireproof buildings shall be incombustible partitions. Where blocks are used for building partitions or as enclosing walls the joint shall be well filled with mortar.

The partitions shall be wedged tight between floors and ceilings with incombustible wedges.

936. (Partitions, Fireproof.)—Only fireproof material shall be used for fireproof partitions; if of brick, they shall be not less than 4 ins. thick, and if of partition blocks not less than 3 ins. thick. If fireproof partitions are of reinforced concrete they shall be not less than 2 ins. thick. All fireproof partitions shall be supported directly by the steel construction, or by the fireproof-floor arches, or stone-concrete or brick. No cinder-concrete or wood-flooring shall intervene between any such partition and its support. All doors, windows, sashes, frames, cases

and glass in fireproof partitions shall be built as required in section 927 of this ordinance.

937. (Partitions, Incombustible.)—Only fireproof or incombustible material shall be used in the construction of incombustible partitions, excepting that frames, casings, doors, sash and the rough carpenter-work required for the proper fastenings of such frames, casings, doors or sash may be of wood, and that ordinary glass may be used in doors and partition windows.

938. (Stairs, Landings.)—Stairs in fireproof buildings shall be built of approved cement-concrete, reinforced concrete, stone or with metal supports, metal strings, metal treads, metal platforms, or a combination of one or more of such materials. If reinforced concrete is used in the construction of any stairs in a fireproof building such stairs shall be designed according to the provisions of the sections applying to reinforced concrete. Stairs shall carry a live load of not less than 100 lbs. per sq. ft. on treads and landings, and every part of a stair shall be so designed that the safe limit of fibre stress is not exceeded. The handrails of such stairways may be of wood, all other material in such stairways in fireproof buildings shall be "fireproofed" or "incombustible" material, except cinder-concrete. If stairs are constructed of solid concrete, having the tread and riser in one piece, then there shall be not less than 45 sq. ins. of concrete in the cross-section of such combined tread and riser, and such stairs shall have reinforced concrete or metal outer strings. If stone treads or platforms are used they shall have a metal sub-tread, or sub-platform of the same weight as if the metal alone were used. If platforms have a floor arch sub-structure, as described in section 931 of this ordinance, then the metal sub-platform may be omitted.

939. (Painting.)—All structural metal which is used in a fireproof building or which is used in any foundation, or in reinforced concrete work, shall be clean and free of rust or scale at the time of the enclosure or covering of such metal. All metal which is not to be fireproofed shall have two coats of first-class metal protecting paint.

Specification for Reinforced Concrete.

947. (Reinforced Concrete—Regulations in regard to the Use of.)—The term "reinforced concrete" as used in this ordinance shall be understood to mean an approved concrete mixture reinforced by steel of any shape, so combined that the steel will take up the tensional stresses and assist in the resistance to shear.

948. (Stress.)—Reinforced concrete construction shall be of such nature that the stresses can be calculated according to the accepted formulas of modern concrete engineering practice.

949. (Permission to Erect.)—Before permission to erect any reinforced concrete structure is issued, complete drawings and specifications shall be filed with the Commissioner of Buildings showing all details of the construction, the size and position of all reinforcing rods, stirrups, &c., and giving the composition of the concrete.

950. (Concrete—Mixing—Method of Testing.)—The concrete shall be mixed in the proportions of 1 of cement, 3 of sand and 5 of stone, gravel or slag. The proportions shall be such that the resistance of the concrete to crushing shall not be less than 2,000 lbs. per square inch after hardening for twenty-eight days. The tests to determine this value shall be made by a competent engineer under the direction of the Commissioner of Buildings. The concrete used in reinforced concrete construction shall be what is usually known as a wet mixture.

951. (Cements—Method of Testing.)—Only high-grade Portland cements shall be used in reinforced concrete construction. Such cements, when tested neat, shall after one day in air develop a tensile strength of at least 200 lbs. per square inch; and after one day in air and six days in water shall develop a tensile strength of at least 500 lbs. per square inch; and after one day in air and twenty-seven days in water shall develop a tensile strength of at least 600 lbs. per square inch. Other tests as to fineness, constancy of volume, &c., made in accordance with the standard method prescribed by the American Society of Civil Engineers' Committee, may, from time to time, be prescribed by the Commissioner of Buildings.

952. (Sand—Torpedo.)—The sand to be used in such concrete shall be clean, sharp torpedo sand, free from loam or dirt.

953. (Stone—Crushed, Slag or Gravel.)—The stone used in such concrete shall be clean, crushed stone or gravel, or crushed blast furnace slag of a size that will pass through a 1/2 in. ring. The stone shall be fresh broken, and the gravel shall be thoroughly washed.

954. (Steel.)—The steel used shall be calculated according to its elastic limit; for moving or vibrating loads a steel of a lower elastic limit than is used for quiescent loads shall be used.

955. (Reinforcing—Method of.)—All reinforcing steel shall be completely enclosed by the concrete, and such steel shall nowhere be nearer to the surface of the concrete than the diameter of such reinforcing steel bar or rod or other shape. The steel in beams or girders shall be so disposed that there shall be not less than 1 1/2 times the thickness of the steel in concrete between the steel, and, where more than two bars are used, the bars shall be placed in two or more planes.

Reinforced concrete shall be designed that the stresses in the concrete and the steel shall not exceed the following limits:—Extreme fibre stress on concrete in compression, 500 lbs. per sq. inch; shearing stress in concrete, 75 lbs. per sq. inch; concrete in direct compression, 350 lbs. per sq. inch; tensile stress in steel, one-third of the elastic limit; shearing stress in steel, 10,000 lbs. per sq. inch. The adhesion of concrete to steel shall be assumed to be 75 lbs. per sq. inch of surface where bars are 1/2 in. or less in diameter, and proportionately less for bars of a diameter greater than 1/2 in. The ratio of the moduli of elasticity of concrete and steel shall be taken as 1 to 12.

The following assumption shall guide in the determination of the bending moments due to external forces:—Beams and girders shall be considered as simply supported at the ends, no allowance being made for continuous construction over supports. Floor-plates, when constructed continuous and when provided with reinforcement at top of plate over supports, may be treated as continuous beams, the bending moment for uniformly distributed loads being taken at not less than wL divided by 8; the bending moment may be taken at wL divided by 20 in the case of square floor-plates which are reinforced in both directions and supported on all

sides. The floor-plate to the extent of not more than five times the width of any beam or girder may be taken as part of that beam or girder in computing its moment of resistance.

The moment of resistance of any reinforced concrete construction under transverse loads shall be determined by formulas based on the following assumptions:—

(a) The bond between the concrete and steel is sufficient to make the two materials act together as a homogeneous solid.

(b) The strain in any fibre is directly proportionate to the distance of that fibre from the neutral axis.

(c) The modulus of elasticity of the concrete remains constant within the limits of the working stresses fixed in this ordinance.

From these assumptions it follows that the stress in any fibre is directly proportionate to the distance of that fibre from the neutral axis. The tensile strength of the concrete shall not be considered.

956. (Construction—Reinforced Concrete.)—Reinforced concrete construction shall be designed so that the shearing stresses, both vertical and horizontal, developed in any part of the construction shall not exceed the safe working strength of the concrete as fixed in this ordinance, or a sufficient amount of steel shall be introduced in such a position that the deficiency in the resistance to shear is overcome. When the safe limit of adhesion between the concrete and steel is exceeded, some provision shall be made for transmitting the strength of the steel to the concrete.

957. (Columns—Reinforced Concrete.)—Reinforced concrete may be used for columns when the ratio of length to least side or diameter does not exceed 12. The reinforcing rods shall be tied together at intervals of not more than the least side or diameter of the column, or spirally wound steel may be used.

When vertical reinforcing rods are used in columns, such rods shall have their ends milled normal to the longitudinal axis, and such rods shall have full perfect bearings at each joint, and such joint shall occur only at floors or other points; lateral support and a tight-fitting sleeve shall be provided at all joints of vertical reinforcing rods.

958. (Wind-pressure.)—In the case of buildings in which allowances must be made for wind-pressure as provided in section 1013 of this ordinance, the reinforcing rods of columns shall be connected and the milled end surfaces shall be brought together by threading the rods and by threaded sleeve nuts, or threaded turnbuckles, or methods equally effective and satisfactory to the Commissioner of Buildings.

959. (Tests.—To be made by Contractor on Demand.)—The contractor shall be prepared to make load tests on any portion of a reinforced concrete construction within a reasonable time after erection as often as may be required by the Commissioner of Buildings. Such tests shall show that the construction will sustain a load of twice that for which it is designed without any sign of failure, or in the case of beams, girders or floors without deflecting more than $\frac{1}{100}$ th of the span.

960. (Reinforced Concrete Walls.)—Buildings of Classes I., II., III., VI. and VII. having a complete skeleton construction of steel or of reinforced concrete construction, or a combination of both, designed to safely resist all of the strains caused by the dead weights of the structure and of the live loads and of the wind-pressure within the safe limits of stress provided in this ordinance for each material used, may have walls of reinforced concrete 6 ins. thick for the upper two storeys and walls 7 ins. thick for the two storeys next below the upper two storeys, and walls 8 ins. thick for the storeys next below the upper four storeys, and walls 9 ins. thick for the storeys next below the upper six storeys, and so on downwards, increasing the thickness of

the walls 1 in. for each two storeys or part thereof. Provided, however, that such walls shall support only their own weight, and that such walls have steel rods $\frac{3}{4}$ in. in diameter or of an equivalent area set vertically and spaced not more than 18 ins. apart, and steel rods $\frac{3}{4}$ in. in diameter or of an equivalent area set horizontally tied to the vertical rod at each intersection with these and set not to exceed 24 ins. apart, and provided that where the weight of the walls of each storey is not transferred to the skeleton by spandrel beams the vertical reinforcement shall be increased in weight in an arithmetical ratio of twice as much steel in the two storeys next below the upper two storeys and three times as much steel in the two storeys next below the upper four storeys, and so on downward. Vertical bars shall be spiced together by winding with iron wire. Horizontal bars shall be wired to the columns. Additional bars shall be set around openings, the verticals wired to the nearest horizontal bars and the horizontal bars at the top and bottom of openings shall be wired to the nearest vertical bars.

The steel rods shall be combined with the concrete and placed where the combination will develop the greatest strength, and the rods shall be staggered or placed and secured to the steel or reinforced concrete structural skeleton of the building so as to resist a pressure of 50 lbs. per sq. ft. either from the exterior or the interior on each and every square foot of each wall panel.

(To be continued.)

FIRE TESTS.

THE British Fire Prevention Committee undertook a number of important tests with proprietary work on August 16th, which were followed by an experimental test on the Committee's part on August 17th.

The testing operations commenced with a fire-test with a roller shutter of the "Kinnear" type, erected by Messrs. Arthur L. Gibson & Co. across a 9 ft. opening, the test being intended for the purpose of classification as rendering partial protection. This was followed by a test with a partition of 2½ ins. thickness plastered on one side with special plastering, constructed by the National Fireproofing Co. with a view to obtaining classification as affording "full protection." Thereupon there was a test with a porous brick floor constructed by Messrs. Faber & Co., plastered below, also intended for classification under "full protection."

The following were the times of the respective tests and their general outline, but of course the official reports have to be issued still, and pending their issue we cannot give detailed particulars.

The Kinnear door was under test for an hour and a half at temperatures rising to over 1,800 degs. Fahr., followed by the application of water from a steam fire-engine for 2 minutes.

The partition was under test for 2½ hours at temperatures rising to above 1,800 degs. Fahr., followed by the application of water for 2 minutes.

The Faber floor was also under test for 2½ hours at temperatures rising to above 1,800 degs. Fahr., followed by the application of water for 2 minutes.

As to the experimental test, this was with a concrete floor with Skelton broad flange girders as beams; the test was of 4 hours' duration, followed by the application of water for 5 minutes.

THE GILMOUR DOOR TESTS.

The reports issued during the current month by the British Fire Prevention Committee comprise two, referring to tests of general interest—one of the Gilmour Door Co. with two doors, the other in respect to a floor of the National Fireproofing Co. plastered on the soffit with 1 in. special plastering. Of these two tests the test with the Gilmour doors is certainly of a most interesting character and well merits being dealt with in detail in these columns.

The doors opened up quite a new vista in doors construction, for these doors are light and of good appearance, which cannot be said of the majority of existing fire-resisting doors, be they iron doors or armoured doors. The doors under investigation further showed that with some slight improvements a very considerable fire-resistance should be obtainable. As it is, both the doors under test had only a thickness of 1½ in., and one of the

THE GILMOUR DOOR TEST.

AN ILLUSTRATION OF THE CLIMATIC DIFFICULTIES IN FIRE-BRIGADE WORK AT A LARGE COLONIAL WAREHOUSE FIRE.

doors was a panelled door with panels only $\frac{1}{2}$ in. thick. Both the doors were of the composite description, *i.e.*, made of hardwood, soft wood and asbestos, in accordance with a patented method of the Gilmour Co. The doors were made in Canada and imported.

The following was the object of the test:—To record the effect of a fire of 60 minutes' duration at a temperature gradually increasing to 1,500 degs. Fahr. (815° C.), followed by the application of water for 2 minutes on the fire side, with the view of being classified as affording temporary protection (class B).

The door openings were to be approximately 2 ft. 6 ins. by 6 ft. 10 ins. (0'7619 m. by 2'0827 m.).

The following is the summary of the test:—

Solid Door.

The inner portions of the door and the woodwork forming the centre were carbonized and destroyed; the outer veneer curled on the face and cracked at the joints. The fire did not pass through the door.

Classification as affording "temporary protection" (class B) was obtained.

Panelled Door.

After 51 minutes flame came through under bottom of door.

After 54 minutes the outer face of the door burst into flame all over.

Almost the whole door was destroyed and fell on the application of water at the end of the test.

Classification was not obtained

This object and summary we would supplement by two illustrations, showing the doors after 48 minutes and after 55 minutes, *i.e.*, just before the close of the test.

As to the construction of the doors, the following is their specification:—

The north (left-hand) "solid" door was made quite flush or flat on both sides, the core strips being fixed vertically in the style portions and horizontally in the centre. Surrounding the core on both faces and on the edges was a sheet of asbestos board, $\frac{1}{2}$ in. thick (0'031 m.), fixed with fine French nails 1 in. long (0'254 m.); on this was glued and pressed by hydraulic pressure a veneer of oak $\frac{3}{8}$ in. thick (0'047 m.). The total thickness of the door was 2 ins. (0'0508 m.).

The south (right-hand) door was con-

structed with five horizontal panels, the finished thickness of the panels being $\frac{1}{2}$ in. (0'127 m.), the frame constructed as above and the panels of five thicknesses; the centre core was pine, on either side of which was a sheet of asbestos, as above described, and on the outside a veneer of oak was glued all as described for the "solid" door. The total thickness of the door was 1 $\frac{1}{2}$ ins. (0'444 m.). The frames were in each case 4 ins. by 3 ins. (10'16 m. by 0'762 m.), of oak with $\frac{1}{2}$ in. rebate (0'127 m.), secured to the brick reveals with deal plugs and screws. The sill was 2 ins. thick (0'0508 m.).

The size of each door was 2 ft. 6 ins. wide (0'7619 m.) by 6 ft. 10 ins. high (2'0827 m.).

The frames were pointed all round with lime-mortar where fixed into the brick reveals.

Each of the doors were hung on two 4 $\frac{1}{2}$ in. (11'43 m.) iron butt hinges, and each secured with three 4 in. (10'16 m.) iron neck bolts fixed on the outside. The "solid" door was fixed in the north opening and the panelled door in the south opening. Both opened inwards towards the fire and were fixed in position on June 17th, 1905.

IMPENDING REPORTS.

We understand that the next two reports to be issued will deal with wire-glass (namely, a test undertaken in March last with three vertical openings filled with wire-glass and continued in June with four horizontal openings, *i.e.*, skylights filled with wire-glass, the wire-glass being provided by Messrs. Pilkington Brothers) and polished glass (namely, clear glass having been used in some of the openings). These reports are expected in September.

IMPENDING TESTS.

The autumn arrangements have not yet been completed, but among the tests already arranged for is a test with a concrete floor of various aggregates, already referred to, and a ferro-concrete floor on the Coignet system. There will also be a floor under test constructed by the New Expanded Metal Co., which floor is to be erected in the Committee's new extra large testing chamber, of which the interior measurements are 20 ft. by 22 ft. 3 ins. The first two floors, it is anticipated, will be tested towards the end of September and the last-named one in October.

It is also anticipated that there will be a test in September with Mr. Jabez Thompson's protective coverings for stanchions, and a form of ceiling construction intended to protect existing floors by Messrs. Cullum & Co.

Of floors of a proprietary character great interest will no doubt be centered in the ferro-concrete floor, but there is no doubt that the test of primary importance during the autumn session to the building world generally will be the one with various concrete aggregates in which the Associated Portland Cement Manufacturing Co. are assisting.

THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

September 6, 1905. Vol. 22, No. 552.

6, Great New Street, Fetter Lane, E.C.

Summary.

A correspondent says after a long experience he has found that where mischievous expansion has occurred in concrete floors, in every case the aggregate had been furnace ashes, which he characterizes as a cheap but dangerous and untrustworthy material. Clean river ballast or broken stone are much safer. (Page 141.)

In Japan the master-carpenter combines in himself the functions of architect, contractor and builder. He may be ranked with the artist almost as much as with the artisan. Once you have made a contract with him you have entered upon an agreement which lasts a lifetime, unless there is good reason for breaking it. (Page 141.)

A contemporary draws attention to the misrepresentations practised on firms by bogus "builders' merchants." (Page 136.)

A drinking trough for cattle, built of brick cement rendered, is described on p. 141 and illustrated by detail drawings.

Staining is considered the most practical way of finishing shingles in America. Creosote stains possess advantages over oil stains in that they penetrate more deeply into the wood, and being slow to dry, last longer. For this reason they protect the shingles better against dry-rot. (Page 144.)

In the planning of a crematorium provision should be made for a chapel or cremating hall, incineration chamber, vestry and a waiting-room. Every building should be so arranged that the head of the catafalque or entrance into the incinerating chamber faces due east. The cremating hall or chapel should be planned with a minimum floor space of 1,200 ft. super., this being exclusive of the space occupied by the catafalque or table upon which the body is placed during the service. (Page 132.)

Work on the tower of Canterbury Cathedral proceeds steadily. The whole of the south face has now been strengthened and solidified, and operations on the west side have been commenced. The condition of the stonework has proved to be more serious than was anticipated. (Page 143.)

A number of interesting papers are to be read before the Architectural Association during the forthcoming session. (Page 137.)

The timber trade at Liverpool has lately been rather dull owing to the stoppage of work due to the annual "wakes" and holidays, but there are one or two big jobs which keep up a fair demand. Pitch-pine stocks have been accumulating and are now largely in excess of what they were a year ago. (Page 140.)

The fineness should control the apportionment of cement by weight; if this is done the special quality of the cement will have to be considered, for it will not be necessary to use so much in weight of the best quality cement as of that of an inferior quality. (Page 142.)

Decoration of Government Buildings.

THE way in which the encouragement of art has been neglected by successive Governments in this country is nothing less than scandalous. With all the resources and wealth of modern civilization, we in this greatest empire the world has seen will rank as greatly inferior to small cities and principalities such as Venice and Athens in the encouragement which they gave to all that is highest and noblest in ideals. Our monuments are stunted, unoriginal, unimaginative and ugly. Some few private persons and municipal authorities have done the best in their power to provide opportunities for the education of talent to be worthy of our age, our race and our civilization, but Parliament as representative of the nation has done practically nothing. Our public buildings are not designed solely to serve commercial purposes—to provide accommodation at the least cost—and therefore they are incomplete in expression without the decorative arts, which are part and parcel of architectural art in its highest idealistic phase. Without opportunity for culture, how can our artists be trained to make the best of any work that does come their way—art must lag behind the rest of our civilization. The Law Courts, South Kensington and the British Museums belong to the long list of the incomplete. One would have expected our legislators to have made efforts to render their own home and the representative building of the nation—the Houses of Parliament—beautiful with the decorative arts, but the record shows that they are ignorant of the finest feelings of mankind. Can we wonder at the jobbery, the scandals, the want of high ideals betrayed in Parliamentary life when legislators live amid surroundings uninspiring, to say the least? An agitation has been carried on respecting the decoration of the Palace of Westminster for the past half century, and there now seems some prospect of a further enquiry. Lord Stanmore recently moved in the House of Lords that a Select Committee should be appointed to enquire into and report upon the unfinished condition of the decorations, and he received from Lord Windsor the answer that the Government were willing to agree to an enquiry, but that the exact form it should take would have to be considered. The question of suitable mediums for decoration is somewhat difficult, but since the decision in favour of fresco was come to, much knowledge has been gained. Experiments have been made to investigate the action of atmospheric conditions upon various kinds of decoration, and there is now plenty of variety and more prospect of success. Such an enquiry at the present moment would be very opportune, for the question of decorating the new public

buildings in progress in Whitehall and at South Kensington must shortly come up for decision.

Architects' Fees.

THE question of fees is one that continually agitates the architectural profession. The R.I.B.A. and international congresses have from time to time taken the question in hand, but the present custom is decidedly chaotic. A fixed scale, of course, causes restrictions and produces anomalies, but the necessity for some recognized scale of payment is obvious. For instance, it stands to reason that an architect who does his work conscientiously and is very painstaking should not receive the same payment as his more incompetent and slipshod brethren. Of course he builds up a reputation which may gain an increased *clientèle*, but that is beside the mark. An architect has to do a good deal of plain constructive work, but he is also concerned with the artistic expression of the nature and function of a building; and whereas a fixed scale of payment may not work badly in the former aspect, it cannot but work deleteriously in respect to the latter. Moreover, some buildings are plain and straightforward, but cost a good deal, whereas others which are much smaller entail more work and ability. Therefore it is unfair that these latter should receive less payment than the others. Some of the large works, indeed, are a mere repetition of parts. Then, again, commission is based upon the actual cost of the building, and this encourages a disregard of economy and of extras. If the percentage system must remain it would be better for payment to be made upon the limits of cost imposed by the client, whether the actual cost works out at less or more than this sum; and where extras are entailed by circumstances outside the province of the architect, then extra payment should be made for this by special arrangement with the client. A sliding scale would be advisable so that buildings within certain limits of cost should be paid for at fair rates of percentage, while if a table of equitable rates of payment for various classes of buildings were drawn up it might in great part solve the difficulty. The present method of paying the commission in portions such as 2½ per cent. for the plans, elevations, sections and specification, an extra ½ per cent. for procuring tenders and 2 per cent. for supervision, while it partly meets the necessities of the case where an honest client cannot complete an undertaking, works very hard when an unscrupulous client after securing the drawings hands them over to someone else to supervise, or does without supervision at all. The present Institute schedule stands in urgent need of revolutionary revision.

CREMATORIUM, MILAN, ITALY.

PLANNING OF CREMATORIA AND COLUMBARIA.

By Albert C. Freeman.

"Why hide reason's or affection's eyes?
The grave pollutes—the furnace purifies."

A MOST important subject demanding the attention of public bodies is the existing method of disposing of the dead. The subject, which is perhaps not one of the most pleasant, is at the same time one which must be faced before long. Its discussion, both from the point of reverence and its effect upon the living, is by no means new. The number of ways the ingenuity of man has devised for the disposal of the dead is far, greater than would be imagined.

"Many have taken voluminous pains to determine the state of the soul upon disunion, but men have been most fastidious in the 'singular contrivances' of their corporal dissolution."*

I do not propose to discuss the "singular contrivances," but to simply confine my attention to the two methods adopted by civilized nations—inhumation and cremation.

With our existing method we place the body beneath the surface of the ground, so that the earth may absorb and neutralize the products of a slow decomposition. Some of our cemeteries are established on a clayey soil, the bodies interred being locked up in clay vaults which allow little egress to the dissolving elements; they become cesspools of human remains, with their noxious vapours partly sealed, only to be fully released when a fresh interment takes place, which many a mourner has experienced to their cost. Interments in sandy soil are, on the other hand, even more dangerous: they assist the gases generated by decomposition, together with putrescent matter, to escape into the air above and water beneath.

The late Sir Henry Thompson said:

* Sir Thomas Browne, "Hydriotaphia."

"When the globe was thinly peopled, and when there were no large bodies of men living in close neighbourhood, the subject was an inconsiderable one and could afford to wait, and might indeed be left for its solution to sentiment of any kind; but the rapid increase of population forces it into notice, and especially man's tendency to live in crowded cities. There is no necessity to prove, as the fact is too patent, that our present mode of treating the dead, namely, that by burial beneath the soil, is full of danger to the living."

In almost all the nations of Europe the distance from a graveyard at which wells may be sunk is regulated by legislative enactment. The distance varies in different parts: in Italy, the prohibited distance is about 300ft.; in France and Austria it is almost double this distance. At a hygienic council convened in Brussels in 1852 it was held that 1,200ft. was the minimum distance that could be regulated as protective. I ask, then, if there be no risk of foul liquids entering and polluting wells or springs near burial-grounds, why should these precautions be adopted?

With the ever-increasing growth of our cities, can we afford to expend large sums of money on cemeteries and sacrifice the rights of the living to the accommodation of the dead?

We have no assurance that the bodies of those we have buried will remain there for ever. It may surprise some to hear that the Law Courts, the Bank of England, King's College Hospital, and many other buildings of note in London, are standing upon old graveyards. Before another generation has passed away the burial-grounds situated in our principal cities will meet the same fate: that which remains of the bodies carefully and tearfully laid away (with money lavishly spent on well-constructed brick vaults and pompous funerals) will be removed by the pick or some other more up-to-date instru-

ment, by a class who will have recognized the sickening state of corruption the body undergoes when buried beneath the soil.

It has been argued that there is no finer disinfectant for disease than earth; this fatal illusion that the earth renders harmless that which is given off from the body must be dispelled; proof of the fact is superabundant. Of course evils arising from earth-burial will vary in intensity according to the character of the soil in which the interment takes place, but under the most favourable circumstances dangerous emanations must arise from burial-grounds, there being no more natural escape for the gases of decomposition than by levitation.

Mr. William Robinson, F.L.S., in his work "Cremation and Urn-burial, or Cemeteries of the Future," says: "During the time that the merits of cremation have been under discussion its advocates might have strengthened their case had they been cognizant of the way in which two of the cemeteries in South London were being managed."

The matter he refers to is as follows: "An impression prevailed among those residents near Battersea cemetery that an exceptional amount of sickness in the neighbourhood, including cases of scarlet fever and diarrhoea, was due to the overcrowding and consequent insanitary condition of the burial-ground. Whatever the cause of the sickness, its existence was a fact."

"The medical officer of health for West Battersea, Dr. Oakman, reported to the Wandsworth Board that the overcrowding also was a fact, and that it was assuming dangerous and alarming proportions. The Home Office was communicated with, Mr. Holland held an enquiry, and all that had been alleged was proved or admitted. The only person responsible in such a case for the violation of the law is the superintendent of the cemetery, who may be fined for every proved offence. In this instance his resignation was required by the Home Office."

Sir Charles Cameron says: "I might multiply examples *ad nauseam* to prove the danger of contamination to our water-supply which many of our burial-grounds present. It is sufficiently evident, however, that every burial-ground must be drained, and that the drainage must ultimately find its way into our rivers and watercourses from which water is taken for domestic purposes, thus affording an obvious channel for the propagation of the infection."

We demand the quick removal of offal, perfection in ventilation of our homes and public buildings, the construction of drainage and plumbing work on scientific principles for the purpose of guarding health; still, we continue to dispose of our dead in a way that violates more than any other the health of the communities. Some of our greatest scientists have declared over and over again that our present method of burial is against the general laws of sanitation and decency; how much more is it, then, in the case of those who die from infectious disease? Pressure should be brought to bear upon the Government to bring in legislation making it compulsory that the bodies of all persons dying from infectious diseases shall be destroyed by burning, and prohibit the burial of such bodies. We should then somewhat check the spread of disease and safeguard the living against continuous epidemics of infectious disease.

As, I venture to think, I have proved our present system of burial is accompanied by dangers, we will give a glance at the question of cremation as a method of disposing of the dead.

Cremation was practised by the primitive Aryans, who consigned the bodies of the dead to the flames in the belief that by that means alone the body could be transformed into a spirit. In Rome, from the close of the Republic to the end of the fourth Christian century, burning was the general rule.

At one time all the great nations of the world, the Egyptians, Persians and Chinese excepted, practised cremation. The Egyptians staunchly adhered to their custom of embalming or disembowelling their dead, thus rendering them somewhat harmless. In China cremation is, comparatively speaking, a modern practice. There is evidence to show to what extent cremation was practised in this country by the Druids, Celts and the early British; many examples of the urns used by them to preserve the ashes of the dead may be seen in the British Museum.

In 1797 a Jesuit Father, and a member of the Institute of France, proclaimed the necessity of substituting cremation for burial; there was some discussion of the ways and means, and an attempt was made to secure an enactment, but it was futile, and in the end the subject became dormant. In 1866 various papers were published in Italy commending the method of cremation, but it was not until 1872 that any practical experiments were made; in this year Gorini published the results of his experiments. In 1873 Professor Brunetti detailed his experience, and exhibited the results with a model of his furnace at the great exhibition at Vienna. In France the adoption of cremation was delayed by the fear of the process affording criminals an opportunity of destroying any trace of their crimes. In 1875 a report was drawn up in favour of cremation by a Commission of Municipal Councillors and Sanitarians, but the police objections nullified it. The agitation, however, continued until 1885, when the Minister of the Interior gave his permission for the establishment of a crematorium, but to be used merely as an experiment and for cremating the *débris* of the dissecting-room. In 1887 the law was so amended that any person in a position to dispose of his worldly belongings by will was given complete

CREMATORIUM AT HEIDELBERG GERMANY. PH. THOMAS, ARCHITECT.

option in respect to the burial or burning of his body after death. In 1889 there were forty-nine cremations at the Paris Municipal Crematorium; in 1903 the number had reached 306.

The history of cremation in this country dates back to 1874, when the late Sir Henry Thompson contributed an article to the "Contemporary Review" describing the process and arguing strongly in favour of its adoption. A society was formed for the purpose of advocating cremation in April, 1874.

In 1879 the crematorium at Woking was erected, but as the Home Office prevented its utilization it lay idle for several years. In 1882 the council of the Society was requested by Captain Hanham, of Blandford, Dorsetshire, to undertake the cremation of two deceased members of his family who had left express instructions to that effect. The Society being unable to undertake the cremation, Captain Hanham then erected a crematorium upon his own estate, in which the

wishes of his relatives were successfully carried out. He died a year later, his body being cremated in the same furnace.

The Government entered no protest against this operation. In 1883, a cremation having taken place in Wales in defiance of the coroner's authority, legal proceedings were consequently instituted. These resulted in 1884 in the decision of Mr. Justice Stephens declaring that cremation was a legal procedure provided it be effected without nuisance to others.

In April, 1884, the House of Commons refused to pass a Bill providing for the regulation of cremation. The Cremation Society of England, however, backed up by the decision of Mr. Justice Stephen, announced that the crematorium at Woking was at the service of the public providing certain conditions were complied with.

On March 20th, 1885, the Woking Crematorium was used for the first time; during that year three bodies were cremated. Since then crematoria have been erected at Golders

GROUND PLAN OF CREMATORIUM AND COLUMBARIUM AT GENEVA. J. BROCHER, ARCHITECT.

Green, N.W., Liverpool, Manchester, Sheffield, Birmingham, Hull, Leicester, Bradford, Ilford (for the City of London), Darlington, Headingley and Glasgow. The total number of cremations in this country to the end of 1904 was 4,407. Crematoria are contemplated at Newport (Mon.), Harrogate and Hornsey.

Cremation was introduced into Germany at Gotha in 1878, since which time several crematoria have been erected. The first cremation took place in 1878; up to the end of 1903, 7,551 incinerations have been performed.

The first cremation took place in Switzerland in 1889, and up to the present over 1,400 bodies have been cremated. In Denmark the first was in 1893, and up to the present the total is 275. In Sweden the first was in 1887, and up to the end of 1903 the total is 915.

Cremation in the United States dates back to 1873, when it was proposed that a crematorium should be erected in New York, but the idea was not carried out. The first building was erected in 1876 by Dr. F. Julius Le Moyne, of Washington; it was primarily designed for the cremation of his own body, but, to create interest in the subject and to assist the education of the question, he permitted its occasional use; it was utilized for the first time in December, 1876, when the body of Baron de Palm was cremated. For eight years this crematorium was the only one on the American Continent. In 1884 the second was erected at Lancaster, when three bodies were cremated during the first year; the year following the New York and Buffalo crematoria were erected, when nine bodies were cremated in the first mentioned and one in the second. Since that time year after year has seen more crematoria erected, until now there are twenty-five at the service of the public. In 1902 the total number of bodies cremated in the United

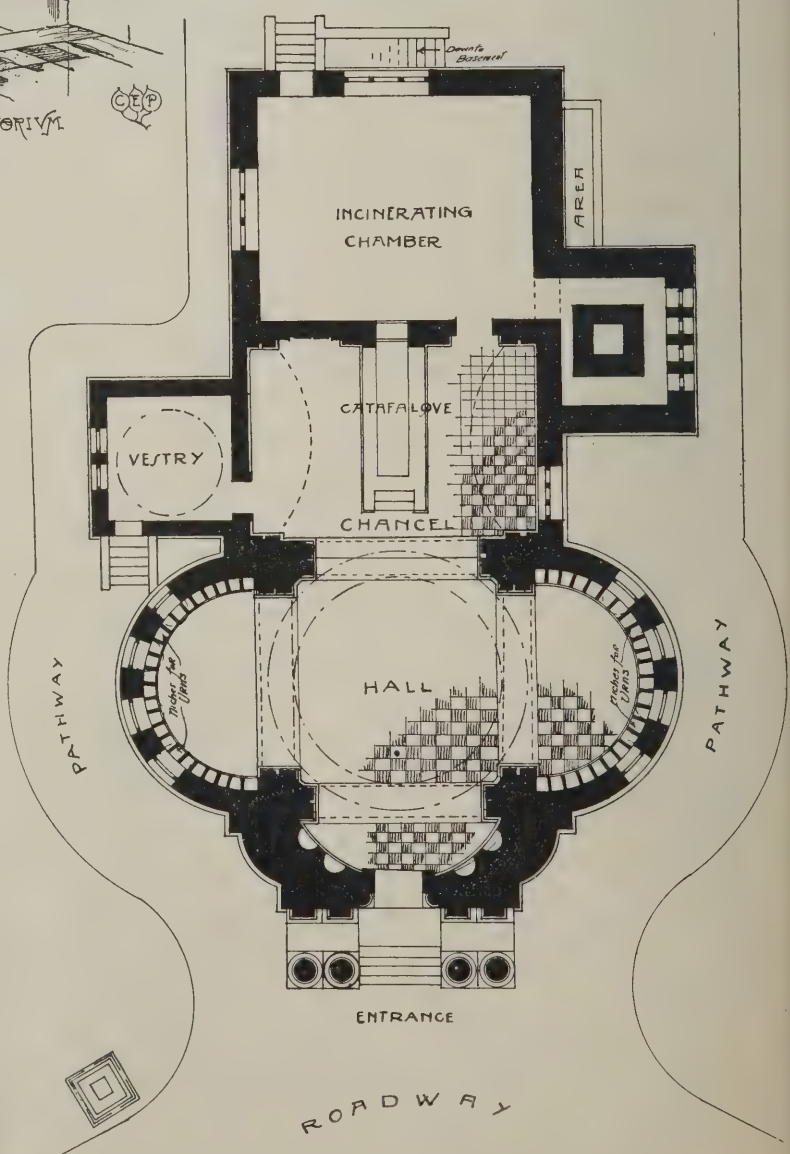

States of America was 3,105, and from the commencement up to the end of 1902, 19,071. (The complete statistics of 1903 and 1904 I am at present unable to obtain.)

The first crematorium to be erected in Canada was at Montreal in 1902; and in Australia, at Adelaide in 1903.

The indifference on the subject of cremation we must conclude is in a large measure due to ignorance. We may now enquire as to the process of cremation and what constitutes a crematorium and columbarium. The body is placed during the service upon a catafalque or table; when the committal sentence is reached the shell is either withdrawn through an opening at the rear or lowered by noiseless mechanical means to the cremating-room, where it is deposited on a carriage which conveys it to the incinerating chamber of the furnace. No flames touch it: it is placed in a chamber which presents a bright orange-coloured tint, and is destroyed purely by the agency of gases generated either by the use of coal, coke or gas. In the course of an hour and a half the remains, which are in the form of ashes, are swept by an asbestos brush into the urn which is placed below the heated chamber. The remains are afterwards sealed and handed to the representatives of the mourners, to be subsequently deposited in the niche of a chapel, colonnade or columbarium, or may be buried in the earth.

Planning and General Arrangement.

Among the subjects upon which the profession does not possess any great amount

DESIGN FOR CREMATORIUM BY ALBERT C. FREEMAN.

of knowledge, and which is before long bound to become not only an interesting but a profitable addition to architectural practice, is the design of crematoria and columbaria. Speaking generally, the following provision should be made in the planning of a crematorium: a chapel or cremating hall, incinerating chamber, vestry and a waiting-room for the use of those relatives or friends anxious to remain until the body has been reduced to ashes.

As these buildings are invariably unconsecrated, it is immaterial whether or not they are placed upon the site with a due easterly aspect; at the same time I should certainly advocate that every building be planned so that the head of the catafalque or entrance into the incinerating chamber be arranged to face due east. The cremating hall or chapel should be planned with a minimum floor-space of 1,200ft. super., this being exclusive of that space occupied by the catafalque or table upon which the body is placed during the service.

I have found in most of the foreign crematoria that niches are provided in the walls of the chapel for the reception of urns, thus making a combination of a crematorium and columbarium.

The plan on the previous page shows a crematorium, with hall, incinerating chamber and vestry; in this case the incinerating chamber is arranged on the same level as the chapel or hall. Some designers consider it a more advisable plan to arrange the whole of the cremating apparatus in the basement under the chapel, or at a lower level than the latter, so that when the committal sentence in the funeral service—"ashes to ashes"—is reached the coffin is automatically lowered as in earth-burial, instead of being drawn through the opening at the end of the catafalque. It is, however, necessary in all cases to provide a basement to receive the lower portion of the incinerating furnace, the stoking of the apparatus being performed at this lower level (see section on this page), which should have a height of about 7ft. The majority of the foreign crematoria have their cremating chambers under the chapels, or at a lower level than the same. In Great Britain, with the exception of Glasgow, they are placed on the same level as the chapels.

The incinerating chamber, when planned for a single furnace, should be 35ft. 6ins. long and 21ft. in width; when two or more furnaces are provided, then the superficial area will be increased in proportion. The chimney shaft should be arranged in as close proximity to the cremating furnace as possible; it should be erected to a minimum height of 60ft. Some of the crematoria chimneys are carried up to a greater height; for instance, the Hull Municipal Crematorium chimney is 70ft., but, to suit the working of both Messrs. Simon's and Toisoul, Fradet & Co.'s furnaces, 60ft. will be found satisfactory. It is advisable to clothe the chimney with a tower and avoid the sight of a feature which is anything but artistic, however well treated.

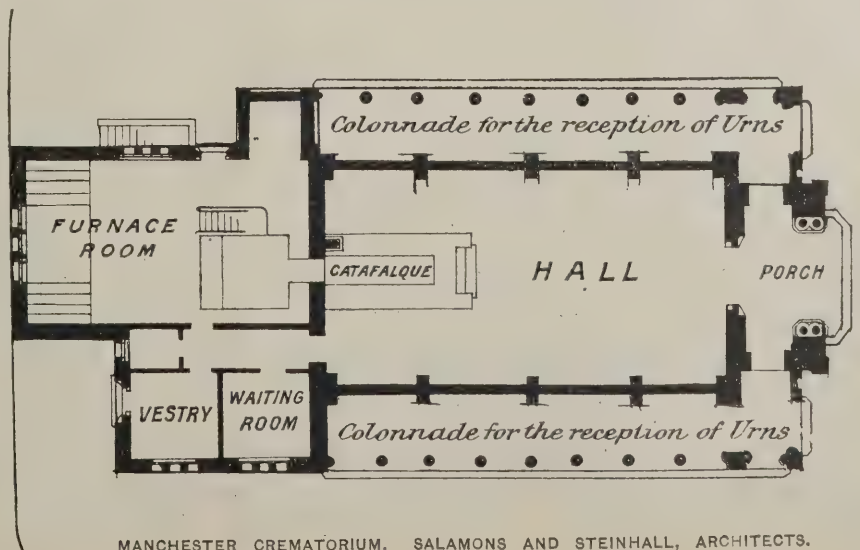

In the planning of columbaria it is the general practice to arrange a large hall with the external walls honeycombed with niches or, latebræ. The vase-shaped urns measure about 1ft. 6ins. high, and those of the box-shape measure 16ins. by 8ins. and are 8ins. high. The only columbaria in this country are at Golders Green and Liverpool, but neither can be taken as good examples. There is a columbarium in the Hedon Road Cemetery, Hull, which is constructed in the form of a grotto; it is both picturesque and original. The Liverpool columbarium is arranged in the crypt under the chapel, and has provision for upwards of 480 urns. In the Manchester crematorium provision is made for the reception of urns both on the inside and outside of the external walls of

Builders' Notes.

Bogus Builders' Merchants.—We take the following from the "Ironmonger": "A fire-grate maker received from a provincial town an enquiry from an unknown person requesting him to send his list and quote best trade terms. The letter was on plain writing paper, but accompanying it was a printed card giving the writer's name and address, and the legend 'Builders' Merchant.' The maker, doubtful rather of his correspondent's good faith, wrote asking for a trade reference and an assurance that his class of wares was stocked by him. The reply to this was a bankers' reference and an explanation that the goods were wanted for buildings in course of erection. The writer did not even

state that he was a builder, and for all we know he may be only a speculator in cheap property. The term 'builders' merchant' has been grossly abused and misapplied, but possibly six out of ten firms to whom the card was addressed quoted trade terms without making enquiry, to the hurt of traders legitimately entitled to the use of the words."

Owing to the collapse of a Building at Bolton recently Mr. Rupert Brockbank, an estate agent, was crushed to death. Two others were seriously injured.

Reform of the By-laws.—The Staines Urban District Council have appointed a committee to consider and report to the Council what alterations in the existing by-laws may be necessary, or desirable, so as to afford facilities for the erection of dwellings for the working classes at a less expense than is possible under the by-laws at present in force.

Scientific Plumbing.—A part of the course of advanced instruction for plumbers given by the Plumbers' Company at King's College, London,

includes visits to notable buildings where plumbing and sanitary work is in progress. A party of students attending this course recently visited the workmen's dwellings at Grove End Road, St. John's Wood, where the foreman in charge explained the character of the work and pointed out the various specialities. The details of the drainage were described to the students, and a section of the drains tested by hydraulic pressure to prove their soundness. The whole of this contract has been executed by Messrs. Davis & Bennett, of Westminster, and registered plumbers were employed throughout the work.

An Exhibition of Advertising Drawings and Designs is being held by Messrs. W. H. Smith & Son by way of inauguration of their new offices at 12, Norfolk Street. The drawings shown are by Cecil Alden, Lewis Baumer, R. P. Gossop, John Hassall, R. Pannett, Charles Pears, H. Rowntree, S. E. Scott, Will Topham, Fred Taylor, and a large number of the leading draughtsmen and designers of the day.

A new Liberal Club at Honley is being built of stone with ashlar dressings, and is estimated to cost £1,700. The work is being carried out by the following firms:—Masons, Messrs. R. Jenkinson & Son; joiners, Messrs. Ben Oldfield & Co.; plumber, Mr. Harry Webster; plasterer, Mr. Shaw Whitehead; painter, Mr. F. B. Hinchliffe—all of Honley; and concreter, Mr. John Cooke, Huddersfield. The plans have been prepared by Mr. J. Berry, architect, Huddersfield.

A new Scheme of constructing Polling Booths has been devised by Mr. James Thomson, city architect, Dundee. Hitherto temporary polling booths have been erected under contract, and removed on the day following the election: these cost £45 last year: but by Mr. Thomson's system, after an initial outlay of £100, the annual expense will be not more than £3. The compartments are designed in sections, and can be erected in ranges of any number to suit the requirements of the various polling booths. The Works Committee have approved of the scheme and recommend the Town Council to adopt it.

MAIN ROTUNDA, COLUMBARIUM, ODD FELLOWS CEMETERY, SHOWING ENTRANCE TO STAIRWAY AND MAIN COLUMNS SUPPORTING DOME.

the chapel, those on the outside being protected from the weather by colonnades.

The most magnificent building in existence is that of the Odd Fellows Cemetery Co. at San Francisco.

This building is planned with a large rotunda having four quadrants leading from the same; it is arranged in two storeys, and has provision for upwards of 5,000 niches of great variety both in size and style.

It is essential in planning a columbarium to arrange all niches so that they are easy of access. The front of each is enclosed with marble or bevelled plate-glass, held in position by means of detachable copper or bronze frames, the interior being tinted, frescoed or draped.

New Poor Law Offices at Camberwell, in Peckham Road, are being completed. Mr. Edwin T. Hall, F.R.I.B.A., is the architect.

A Presbyterian Church Hall at Glanton has been opened. The building, which was designed by Mr. Adam Hunter, of Glanton, cost £500.

A new Pavilion at Dunoon has been erected. The building is designed in the free Classic Renaissance, the front building consisting of a row of shops with reception-rooms above, the back building being the hall, octagonal in shape. It is constructed of stone and brick, with a steel roof covered with tiles. There are four staircases leading to the gallery. Accommodation is provided for between 3,000 and 4,000 persons. At the outset the estimated cost was £6,000, but it is expected to reach £10,000. Mr. J. Fraser, of Dunoon, was the architect.

Views and Reviews.

A New Book on Design.

By this time there is no dearth of books on design and ornament, and we do not see that this present text-book would have any claim for appearance if it were not written on the lines of the revised syllabus of the Board of Education. The author's intention, however, is not so much to supply a few recipes which the student might get off by heart for the purpose of successfully passing the examination—supposing this were possible or desirable—but rather to assist him in forming an intelligent understanding of the general scope and scale of the decorative arts. Each chapter has a somewhat ordinary historical introduction, and for the rest consists of good advice on the elaboration of design and its application as ornament and decoration, especially in its treatment as an architectural adjunct. But we do not think that the letterpress of the book calls for much comment. It is the illustrations which are admirable. Mr. Rhead is a master-draughtsman in line, and the manner in which he has produced the numerous drawings of architectural features, types of birds, insects, &c., are models for every student to study. Therefore we think this book will be valued far more for these excellent drawings than for the letterpress which accompanies them, and as such we bring it to the notice of our readers.

"The Principles of Design," by G. Woolliscroft Rhead, R.E., Hon. A.R.C.A. Lond. London: B. T. Batsford, price 6s. nett.

Measurement of Areas.

The object of this pamphlet is to draw attention to the advantages of Amsler's Planimeter as a means of computing irregular land areas from maps and plans, and at the same time to provide a brief description of, and simple instructions for using, that very useful instrument, together with an explanation of its working principles. As printed instructions are usually sold with the instrument the necessity for this book is not very obvious. Still, to those requiring further details of the working of the instrument we can commend this treatise. The explanations are extremely simple, and the author at once does away with the somewhat prevalent idea that the planimeter is a complicated and delicate piece of mechanism requiring special knowledge and skill in use.

"Land Area Computation made Easy. Being a Simple Treatise on Amsler's Planimeter, with Instructions for its Use," by W. Codd. London: E. & F. N. Spon, Ltd., price 6d. nett.

Stephenson's "Repairs."

A fourth edition of this well-known book is before us. It has been revised and the prices increased to meet the present cost of labour and materials, and a chapter has been added on modern decoration and recent improvements in house drainage, electric-lighting, bells, &c. The book is thoroughly reliable, compactly written, and will be found most serviceable to all connected with house repairs.

"Repairs: How to Measure and Value them in Competition," by George Stephenson. London: B. T. Batsford, 94, High Holborn, W.C., price 3s. nett.

Fletcher's "Valuations and Compensations."

In this third edition several minor additions have been made, including some to the tables at the end, and the book has been brought generally up to date. The call for another edition is the best possible testimony to the worth of the book.

"Valuations and Compensations," by Prof. Banister Fletcher, revised and re-written by Banister F. Fletcher and H. Phillips Fletcher. London: B. T. Batsford, 94, High Holborn, W.C., price 6s. 6d.

TRADES' TRAINING SCHOOLS.

THE report, just published, of Mr. H. Phillips Fletcher, F.R.I.B.A., F.S.I., A.M.I.C.E., Director of the Trades' Training Schools, on the work of this training centre for the building trades, states that the carpenters' class numbers thirty students. The fact that four medals were gained in this shop, including the "Banister Fletcher Medal," which has been awarded to Mr. E. J. Beesley, shows that the shop is well maintaining its position in the schools. The joinery class numbers thirty-six students and seven in the handrailing. There are fourteen students on the books of the masonry class. There are nineteen students in the painter-stainers' class, and the work reflects great credit upon the Painter-Stainers' Company. The plasterers' class numbers only four; this is most unsatisfactory, and it is to be regretted that the improvement shown last year has not been maintained. The plumbing class shows an increase of four students' and now numbers thirty-five. The smiths, class numbers seventeen, which shows a considerable increase on previous years. The repoussé class, lately attached, is much appreciated. The stonecarvers' class numbers fourteen students. The tylers' and bricklayers' class has twenty students, which shows that it is still maintaining its position. The woodcarvers' class numbers nineteen students, a slight increase on last session.

The report of the judges on the work done shows what excellent progress is being made by the students at the institution. In the carpentry department, particularly, the work was of such a high character that the judges had some difficulty in classifying the exhibits. Illustrations of specimens of work by the students are printed with the report, and they give a good idea of the fine standard of craftsmanship to which a diligent student may attain.

THE ARCHITECTURAL ASSOCIATION SCHOOL.

Curricula for Forthcoming Session.

THE curricula of the Architectural Association for the session 1905-6 has just been issued. Full particulars are given of the day school, evening continuation school, evening studio and evening lectures and classes.

The following papers will be read before the ordinary meetings of the Association:—

- Oct. 6. Annual General Meeting, President's Address and Distribution of Prizes.
- " 20. "London City Churches," Andrew Oliver.
- Nov. 2. Conversazione.
- " 17. "Old Manor Houses," J. A. Gotch.
- Dec. 1. "Turkish Architecture," E. F. Reynolds.
- " 15. "Church Towers and Spires," W. H. Bidlake.
- Jan. 19. Subject to be announced.
- Feb. 9. "Differences between English and French Gothic Art," Rev. G. H. West, D.D., A.R.I.B.A.
- " 23. "Porches and Approaches," F. T. Baggallay.
- Mar. 9. "French Modern Architecture," A. Vye-Parminter.
- " 23. "The London Club House of Last Century," A. W. Scames, M.P.
- April 6. "Valuations, Compensations, Light and Air," E. Greenop.
- " 27. "Fenestration," Walter Cave.

The papers to be read before the Discussion Section are as follows:—

- Oct. 25. "Casements and Lead Lights," H. F. Waring and C. Wainwright.
- Nov. 8. "Inexpensive Cottages," Geoffrey Lucas, A.R.I.B.A.
- " 22. "Village Schools," H. Passmore, A.R.I.B.A.
- Dec. 6. "The Conversion of the Jerry-builder," W. A. Forsyth, A.R.I.B.A.
- Jan. 3. "The Houses of Parliament," P. J. Turner, A.R.I.B.A.
- " 17. "The Ideal Architect from the Client's Point of View," Edwin Gunn, A.R.I.B.A.
- " 31. "Internal Steps and Stairs and their Treatment," A. C. Dickie, A.R.I.B.A.
- Feb. 14. "Modern Hotels and Restaurants," S. H. Hamp, A.R.I.B.A.
- " 28. "Shop Fronts," E. C. M. Willmott.
- Mar. 14. "Libraries," S. Towse, A.R.I.B.A.
- " 28. "Fences and Gates," W. L. Trant Brown.
- April 11. "Ferro-concrete," S. Byland.

Obituary.

Mr. James Richardson, builder, of 48, Larkspur Terrace, Jesmond, died suddenly last week, aged 71 years.

The body of Mr. Charles Robert Burton, a well-known Warrington architect and surveyor, was found in the River Mersey recently. Mr. Burton was over 60 years of age.

Mr. David Jenkins, contractor, of Swansea, died recently at the age of 72 years. He was for years a member of the firm of Thomas, Watkins & Jenkins, who carried out very important contracts in the neighbourhood. This firm dissolved partnership about ten years ago, and since then Mr. Jenkins had carried on business on his own account.

Mr. James Weir, F.R.I.B.A., of the firm of Weir, Burrows & Weir, architects and surveyors, died on Sunday week last at his residence at Clapham. A "Men who Build" article dealing with his work was published in THE BUILDERS' JOURNAL for February 4th, 1896. Mr. Weir carried on his business at 17, Victoria Street, Westminster, and acted as architect to the Westinghouse Brake Co., the Victoria Chambers Co. and numerous other companies. He was an authority on school buildings and a well known Methodist architect, having built a very large number of churches &c., notably the Wesleyan churches at Clapham High Street; Queen's Road, Battersea; Putney, Norbiton, Kingston, Fulham, Beckenham, Aylesbury; High Street, Manchester Square; Southgate, St. Leonards, Sevenoaks; Surrey Chapel, Blackfriars, and numerous others in various parts of the country, including the South Coast and Isle of Wight, one of his latest successes being the Victoria Hall at Deptford. He recently took into partnership his nephew, Mr. William May Weir, who had been associated with him for many years past; also his manager, Mr. Fred Burrows; who will continue to carry on the practice under the style of Messrs. Weir, Burrows & Weir as hitherto.

OUR PLATES.

THE London County Council fire-brigade station at Maida Vale occupies the site of Sefton Lodge and has a frontage to the main road of 67ft. 4½ins. The accommodation is for a sub-station (with provision for subsequently converting into a full station), and is contained on three storeys and basement. On the ground floor space is provided for a full-sized engine-room, stabling for two horses adjoining, and opening directly into the same. Swinging harness is provided over the horsed-escape. The ground floor also contains the watch-room, a recreation-room (for full-sized billiard table), various stores, and the station officer's quarters, comprising four rooms, scullery and w.c. In the basement are provided the laundry, drying closet and coke stores. The two upper floors contain accommodation for six married firemen, all in self-contained suites with separate sculleries and w.c.'s. Bathrooms are provided on each upper floor. The hose hoist is of open iron construction and is placed in the yard. The building has been carried out from the designs of Mr. W. E. Riley, F.R.I.B.A., the Council's superintending architect, and was erected by the Works Department in 1904. It is very carefully designed in every part.

In our issue for August 23rd we illustrated the interior of St. Mary's Church, Lancaster, the names of Messrs. Austin & Paley, of Lancaster, being stated as architects. This church is an old one, and Messrs. Austin & Paley have only been responsible for restoration work thereto from time to time.

THE TIMBER TRADE.

Liverpool Market in August.

(By Our Special Correspondent.)

BUSINESS in builders' timber at Liverpool has lately been affected by the stoppage of work in Lancashire and Cheshire by reason of the annual "wakes" and holidays. In the more important towns the "wakes" or summer holiday week is rigorously observed, mills, factories and workshops being at a standstill for the time. This stoppage affects the engineering, building and timber trades, and the normal demand for timber falls below the average. Ordinarily a demand above the average would have been expected, for in addition to a fair amount of house building in progress some big building jobs are now proceeding in the Lancashire cotton manufacturing district, new mills and factories being in course of erection. In the last week of the month more activity was noticeable, and the Derby Road railway yards assumed a more exhilarating aspect. The state of these yards is one of the most reliable indications of the extent of the up-country demand. If the demand be good, timber is sent to the yards, trucked and dispatched. If it be slow, the railway companies do not get the stuff. In the last week of August they received boards and logs in larger quantities and passed them on inland.

The Liverpool local demand has been very quiet. The building of house property is not proceeding briskly at present, so that the local demand for joists, flooring boards and fittings is not active. One big job, however, has made a heavy demand for timber, namely, a new hospital at Fayakerley, to the north of Liverpool, comprising seventeen large blocks and eight smaller ones, while the new offices of the Mersey Docks and Harbour Board at St. George's Dock, Liverpool, are just approaching the stage of maximum demand for timber. The Board have other extensive building operations in progress at the new King's docks, and at the north end of the dock estate, but here timber has been completely ousted by concrete and steel. The Board, however, have works of dock construction and extension in hand involving much heavy piling, bulk-heading, staging, staying and counter-staying, for which a good deal of log stuff has been required and will be required: and ere long the Board will commence their new work of dock-construction at the extreme north of the present dock estate, which will involve an expenditure of something like four millions sterling and will create a large demand for log and rough timber.

Deals and Pine.

Deals have been in fair demand, especially of sizes 3ins. by 7ins. and long 3ins. by 11ins.

Canadian pine deals and spruce deals have come to hand in quantities which have more than maintained stocks. Prices have consequently been easy. The arrival of quantities of timber sent on consignment has tended to make buyers indifferent and to keep prices low. Some of the large holders, however, expect prices to harden in view of demands which will probably be made when the effect of the holiday disturbance has passed away.

The arrivals of Quebec pine deals make a shortage for the year as compared with 1903 and 1904, but this has been more than made up by the arrivals of New Brunswick and Nova Scotia spruce and pine deals, which leave the receipts for the present year in excess of those in the corresponding period of 1903 and 1904.

Flooring boards for general use have met with more enquiry, and prices are somewhat higher. Supplies of these boards continue light and stocks of some sizes are very low.

Pitch-pine has come to hand more freely, and the effect of the light arrivals earlier in the year has passed away. There is still, however, a steady demand for this wood, and quay lots have been quickly taken up at fair prices. Sawn timber has been in moderately good demand, boards 15ins. or 16ins. wide especially finding ready buyers. Stocks of planks and sawn wood are still much smaller than the stocks held at the corresponding time last year and in 1903, the shortage in sawn wood especially being great. But there has been more than ample to meet the demand. Log stuff is now the least active. Stocks have been accumulating and are largely in excess of what they were a year ago.

Mahogany

has been in moderate supply, and the stocks offered have found ready purchasers. African, principally, has been received. At the auction sales, lots have been eagerly competed for and high prices have been obtained. A feature of the business at Liverpool is the buying on American account. Buyers attend the Liverpool sales regularly to purchase stocks for shipment to the United States. This ensures a lively interest in the lots being offered and tends to maintain values. Cuban wood which has been available has sold very readily and at full prices. St. Domingo has been in fair supply but has been neglected so that stacks of this wood have increased. Honduras has been enquired for, but practically no wood has been available. Stocks of useful wood coming forward would find ready buyers at good prices. With the supplies of African and Cuban wood which have lately come to hand, and the interest which has been shown in these woods at the auction sales, the mahogany market closes in a healthy and satisfactory state.

Oak

in logs and planks has been received in moderate quantities, and fairly large stocks are now held. Baltic has been in better request, and the supply is now light.

In the other kinds, wood of good quality has been taken up freely, but poorer qualities have not found much favour. Stocks of Canadian and American and of planks are much lighter than they were at the corresponding date in 1904 and 1903, but are ample to meet the present demand.

Ash

continues to be received in small quantities, and stocks are comparatively light. The demand has been but small, so that the stocks in hand have fully sufficed for requirements.

Hickory

is also in small supply, and holders speak of a scarcity before the year is out. The enquiries for this wood do not show any large interest to be taken in it at the present time.

Birch,

in logs, has been in larger request and fair sales have been effected. Planks have sold with moderate freedom. The quantities recently received have been less than the quantities sold. The shortage has, therefore, been made up from stocks. These seem quite sufficient to meet immediate demands, the stock of planks being largely in excess of the stock held twelve months ago. The stock of logs is, however, much smaller.

Elm

has sold more freely, at firm prices, requirements being met out of stocks, which are consequently low.

Teak

has met with a better enquiry and prices have been well-maintained. Stocks are comparatively large, and recent arrivals have been on an adequate scale.

Walnut of good quality has been in demand and has brought full prices. Other

qualities have been neglected and the prices of these are weak.

At the mills, sawing has been on a moderate scale and reports speak of business as being quiet.

An increased movement of heavy log stuff, chiefly mahogany, is now noticeable on Derby Road. This is not ordinary "yarding" but indicates a freer movement of stocks to mills or railway stations, and consequently, improved trade.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Value of an Elm Tree.

HARROW.—A. R. B. writes: "Can you give any idea of the value for timber of an enormous elm tree, and give the name and address of any sawmills in this neighbourhood that would buy it standing?"

We could only make a random shot on such insufficient information. We advise you to write to local timber merchants and sawmill proprietors and ask for bids.

Removing a Church to another Site.

EDINBURGH.—A. L. writes: "I propose to take down a church and to rebuild it on another site near. Can anyone give me an instance of where this has been done successfully with a church or other public building?"

Perhaps some of our readers can furnish information on this subject.

Buildings to Measure near Keighley.

KEIGHLEY.—STRAD writes: "Kindly name any buildings of architectural interest suitable to measure in the neighbourhood of Keighley—taking a twenty-mile radius."

Suitable features will be found in the following list of buildings from which to make measured drawings:—Kirkstall Abbey, which is chiefly Transitional Norman and Perpendicular; Bingley Church, Perpendicular; tower of Haworth Church, Perpendicular; Kildwick Church, Perpendicular; St. Peter's Church, Bradford, Perpendicular with parts Early English; St. John's Church, Halifax, Perpendicular and Early English; Skipton Church, Perpendicular; Barnoldswick Church, Perpendicular and Early English; Shipley Church, Perpendicular; Ilkley Church, Decorated and Early English; Bolton Abbey, Decorated and Early English; Guiseley Church, Norman, Transitional Norman and Early English; Otley Church, Norman, Transitional Norman and Perpendicular. The following Renaissance buildings are also within the prescribed radius:—Calverley Hall and Horsforth Hall, both of the Jacobean period; Bowling Hall, Elizabethan; Bierley Hall, dated 1676; and Kildwick Grange and Hall, seventeenth century. H. Y. M.

Competitions.

Perth City Hall.—Between thirty and forty designs have been submitted for the rebuilding of the City Hall at Perth. A meeting of the committee is to be held at an early date, when an assessor will be appointed.

Holy Trinity Church, Failsforth, near Manchester.—The competition for this church, to cost £5,000, has been decided in favour of Mr. R. K. Freeman, of Bolton; the second place being awarded to Messrs. H. & W. Wade, of Blackpool and St. Anne's-on-Sea.

A CATTLE TROUGH.

By G. S. Mitchell, F.S.I.

A DRINKING trough for cattle in yards or pastures is shown on this page. It consists of gin. brick walls built in cement with concrete foundations and lining, and coped with half-round bricks with cement angles and bull-nosed corners.

The interior is cement rendered, and a $4\frac{1}{2}$ in. wall, pigeon-holed in about half a dozen places, shuts off the chamber containing the ball-cock of supply-pipe. This wall should be built after the cement rendering has been performed, or it will be difficult to keep the trough watertight.

The ball-cock is guarded against injury or mischief by a $1\frac{1}{2}$ in. wooden cover (as figure) composed of narrow boards with $\frac{1}{4}$ in. by $\frac{1}{2}$ in. ledgers on the underside, secured at the one end of the trough by two $\frac{1}{2}$ in. by $\frac{1}{2}$ in. iron pins (built into the brickwork just under the cope), which engage with an iron staple $\frac{1}{2}$ in. by $\frac{1}{2}$ in. fixed on the underside of covering board. An L-shaped $2\frac{1}{2}$ in. by $\frac{1}{2}$ in. iron staple built in at the opposite side of the trough fits into a slot in the board, which is there secured by a padlock.

The supply-pipe is brought up the end of trough in a chase formed for the purpose—the stand-pipe is most conveniently fixed before the brickwork—two bends just carry the pipe over the wall (one cope being left out for the purpose) and the ball-cock is connected at about 6 ins. from the end of the trough, and so lies across the centre of the chamber.

Should there be no danger of the stock being left without water, or if a ball-tap be objected to on account of its possible leakage, the feed need not be automatic, and the supply-pipe should in that case be brought up and over the wall in exactly the same way, a small brick just formed in the ground close to the outside of the trough and a substantial screw-down valve—with relief cock to enable the stand-pipe to be emptied in case of frost—fixed in it. A small wooden cover with lifting ring completes the arrangement.

If a trough be placed in the fields it should be so situated that live-stock may get all round it and water with ease. Horned cattle are very likely to injure one another if it be not so arranged.

It is sometimes desirable to place such a trough so as to serve for two fields, and in that case I have found it best to set the trough with its length in the direction of the fence, with a rail over it about 16 ins. above the top of the cope.

A DRINKING TROUGH FOR CATTLE.

BUILDING CONTRACTS IN JAPAN.

IN Professor Hearn's recently published work on Japan he makes the following interesting statement in relation to the methods of use in building operations in the empire of the Mikado:—

"Let us suppose, for instance, that you wish to have a good house built. For that undertaking you will have to deal with a very intelligent class of skilled labour; for the Japanese house carpenter may be ranked with the artist almost as much as with the artisan. You may apply to a building company, but as a general rule you will do better by applying to a master-carpenter, who combines in himself the functions of architect, contractor and builder. In any event you cannot select and hire workmen; guild regulations forbid. You can only make your contract; and the master-carpenter, when his plans have been approved, will undertake all the rest, purchase and transport of material, hire of carpenters, plasterers, tilers, mat-makers, screen-fitters, brassworkers, stone cutters, locksmiths and glaziers. For each master-carpenter represents much more than his own craft guild; he has his clients in every trade related to house building and house furnishing, and you must not dream of trying to interfere with his claims and privileges."

Bound to One Builder for Life.

"He builds your house according to contract; but that is only the beginning of the relation. You have really made with him an agreement which you must not break, without good and sufficient reason, for the rest of your life. Whatever afterwards may happen to any part of your house, walls, floor, ceiling, roof, foundation, you must arrange for repairs with him—never with anybody else. Should the roof leak, for instance, you must not send for the nearest tiler or tinsmith; if the plaster cracks you must not send for a plasterer. The man who built your house holds himself responsible for its condition, and he is jealous of that responsibility; none but he has the right to send for the plasterer, the roofer, the tinsmith. If you interfere with that right you may have some unpleasant surprises. If you make appeal to the law against the right, you will find that you can get no carpenter, tiler or plasterer to work for you at any terms. Compromise is always possible; but the guilds will resent a needless appeal to the law."

At Holy Trinity Church, Nottingham, a Gothic reredos of Austrian oak has been erected as a memorial.

Correspondence.

The Expansion of Concrete Floors in Buildings.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—An interesting and important discussion has been going on lately in your paper to which I should like to be allowed to add a few words.

Your correspondent "A. H." speaks of cases wherein concrete floors in which furnace ashes had been used as the aggregate, and in which mischievous expansion had taken place.

Another correspondent, writing a few weeks earlier, describes the same sort of thing, also with the use of furnace ashes mixed with the cement; while in that case some of the same cement mixed with clean sand and subjected to the glass-bottle test showed no expansion at all. Surely this is reasonable proof that the injurious expansion was caused not by any fault in cement, but by the chemical combination of one or more of the by-products in the furnace ashes producing a compound which expanded and so caused the mischief.

It is quite obvious that furnace ashes must be always liable to the possession of various and obscure compounds. They must always contain sulphur in some form or other—a very active chemical agent. Also every kind of refuse is thrown into a fire with results that cannot be known or foreseen.

Having had a long experience in dealing with concrete floors I have found that wherever mischievous expansion has taken place, in every case without exception, the aggregate has been furnace ashes. Surely, with this fact in view, it is the part of wisdom with builders to avoid this cheap but dangerous and untrustworthy material! Clean river ballast or broken stone are much safer materials, and where the floors are being put into large and costly buildings, as is so much the case at the present day, why for the sake of cheapness use a material that may bring so much trouble in its train!

Now that the new ferro-concrete is coming so much into use, it is most important to those who are responsible for the work to secure the very best materials for it, as the whole is liable to failure if the materials employed are not of the best procurable.

Having said something about the aggregate, may I now add a few words about the cement. It is sometimes erroneously supposed that cement may be and has been made which has no expansion at all. This is not the case, unless the cement has been kept so long as to have lost its most valuable cohesive properties. The recently issued "Standard Specification" for cement, as prepared by the Committee of the Institution of Civil Engineers, assisted by technical experts, expressly provides for a small measure of expansion, but limiting it to a prescribed figure. Until comparatively recent times no Portland cement would have complied with this severe limitation, and it can only be arrived at by very accurate mixture of the raw materials, by their extremely fine reduction, by good burning and careful rejection of any underburnt portions, and by fine grinding of the resultant clinker. When cement has been prepared in this way it is immediately ready for use, and can be relied on to do good work without fear of mischievous expansion.

The more perfectly these processes of the manufacture are performed by the manufacturers the better will the cement be. In compliance with the demand for the highest quality, the Associated Portland-cement Manufacturers have lately produced a cement which is sold under the name "Ferrocrete," which has been expressly made for ferro-concrete work. Its production is characterized by great care in all the processes

indicated above—it has the highest measure of tensile strength coupled with the lowest measure of expansion—in the latter case far below that prescribed by the "Standard Specification."

It has been used by the most eminent London builders in concrete floors, in ferro-concrete construction, as well as in concrete piles, with the best results. The writer believes that in the use of such cement, coupled with the absolute avoidance of furnace ashes, concrete floors may be put into large and costly buildings without any of the deleterious results that have sometimes made their appearance when less care has been exercised in the selection of the materials.

—Yours truly, CONTRACTOR.

LONDON.

[At the end of Mr. Thomas Potter's letter on this subject in our issue for last week by a printer's error a coke-breeze concrete pier is stated to have crushed with 205·7 lbs. per sq. inch instead of 2,057 lbs.—Ed. B.J.]

An interesting communication by Mr. Benjamin Hannen, junr., for Messrs. Cubitt & Co., whose great experience as contractors for reinforced concrete work is so well known, was published recently in the "Journal of the Royal Institute of British Architects" on the subject of Portland cement for reinforced concrete, and may be opportunely referred to in connection with the above letter. Mr. Hannen states that before giving an order for cement Messrs. Cubitt & Co. enquire as to the standing of the manufacturers, and see that there is a well-fitted laboratory and a staff of experts, and that samples of the mixture are taken at frequent intervals and analysed in order to ascertain whether the substances are present in the right proportions.

If the results of the enquiry were satisfactory they would sooner trust the cement coming from such a firm, without any tests whatever, than accept a new cement which had been tested only as neat cement for seven days.

When the cement ordered reaches the job, a sample is taken and forwarded for testing in Messrs. Cubitt's own laboratory. They first of all ascertain the apparent density in this way: they find the weight of a litre of cement, obtained by filling a standard litre measure with the cement by means of a standard apparatus. The weight of the litre of cement gives a number that tells the relative weight of cement under the given conditions to water; consequently, if the number indicating the weight of a cubic foot of water, 62·4 lbs., is multiplied by the number indicating the apparent density, the weight of a cubic foot of the cement is obtained. Their cement has to be delivered to the job in bags containing a certain specified weight of the cement; the bags are carefully weighed on delivery, and any errors that may be found are corrected. The cement contained in one bag is used as the unit in mixing the concrete. Knowing the weight of a cubic foot, and also the proportion in volume of the cement to the aggregate, it is easy to make a gauge-box containing the exact cubical contents for apportioning the aggregate to the cement by weight. By this means every gauge is practically of exactly the same proportion—a result that is impossible if the cement is mixed by measure.

Specifying the weight of a bushel of cement should be entirely given up; the variations in weighing so large a quantity as a bushel as ordinarily carried out are too great. It is essential that the determination of the apparent density should always be made on the same volume. Messrs. Cubitt & Co. attach very great importance to the apportionment of cement for concrete by weight instead of by measure. It is of importance to note that the better the cement the lighter is its apparent density, the specific gravity being at least 3·0. Having found the ap-

parent density, they next ascertain the fineness. The fineness should control the apportionment of cement by weight; if this is done the special quality of the cement will have to be considered, for it will not be necessary to use so much in weight of the best quality cement as of that of an inferior quality. "Take, for example, two good cements that we have lately experimented upon:—

Apparent density.	Residue on Sieves.		
	50 x 50 2,500 meshes per sq. in.	76 x 76 5,776 meshes per sq. in.	180 x 180 32,400 meshes per sq. in.
A. '915	none	none	5·15 per cent.
B. 1·282	none	none	34 per cent.

If the cement be apportioned by weight, then 915 tons of A. will be equal in cementitious value to 1,282 tons of B., thus giving a difference of 40 per cent. in favour of A."

They next test the setting. Generally in specifications the time is mentioned, but no reference to temperature is made. To show the influence of temperature on setting, the same cement that set in two hours in a temperature of 75 degs. Fahr. took, nineteen hours in a temperature of 34 degs. Fahr., and proportionately between. Messrs. Cubitt also test for tensile and compressive strength, and by boiling.

Trade and Craft.

Modern Sanitation.

Under this title the Standard Sanitary Manufacturing Co., of Pittsburg, New York and Chicago, whose London address is 22, Holborn Viaduct, issue (gratis) a monthly magazine. The primary object is, of course, to make the company's wares better known, and though the United States cannot teach us much in the way of sanitation it cannot be denied that their fittings are in every way equal, if not superior, to what we can produce. The magazine referred to is well illustrated and printed, and contains information of a practical value to the plumber. The firm inform us that they will be pleased to forward copies of the magazine to any plumbers who make application.

"Anduro" Roofing.

There are numerous materials for roofing now upon the market, all of which have their special advantages, besides that of tending to reduce the cost of construction. The manufacturers of the "Anduro" roofing, for which Messrs. Hickie, Borman & Woods, Ltd., of Coronation House, 4, Lloyd's Avenue, London, E.C., have been appointed sole selling agents in the United Kingdom, claim several special features for the material which should render it particularly valuable. This material can be used either for roofing, damp-course or as a substitute for linoleum, and it has the advantage of being waterproof, air-tight and light in weight. Moreover, it does not contain any obnoxious ingredients, and remains in good condition without requiring painting or other means of preservation. Further, it is not affected by change of temperature or climate, and as it is a bad conductor of heat, buildings covered with it remain cool in summer. The material is made in five thicknesses.

Asphalt.

There is much confusion in the minds of the profession generally as to the nature of asphalt, and the trade firms connected with the industry have generally been content to allow this mystification to continue, in order that they might be free from any supervision. There has been a good deal of sharp practice, and some smaller firms without a reputation have done work that is most unsatisfactory. The French Asphalt Co. deserve commendation therefore for the publication of an interesting little pamphlet upon the subject, which should help to dispel a good many of the

fallacies that are current. The terms asphalt and asphaltum have been used vaguely to denote (1) bitumen or natural pitch; (2) substances impregnated with bitumen; (3) pitches produced artificially from the residuum oils of naphtha and petroleum, shale grease, animal fat, coal tar and Stockholm tar; and (4) tar concrete or tar macadam, a paving material composed of gravel or broken stone and coal tar. It should be clearly understood that bitumen or natural pitch is not asphalt, although it is one of its principal ingredients. Asphalt is a distinct natural product, like coal, and may be divided into two varieties, limestone impregnated naturally by bitumen, and bitumenised sandstone. It is only the first that is at all valuable for paving purposes. The pamphlet published by the French Co. puts the matter plainly when it says that "Tar-paving is not asphalt; British asphalt is not asphalt; Trinidad pitch is not asphalt; and the many concoctions and compounds labelled 'asphaltic this' or 'bituminous that' are not asphalt." The following is a chemical analysis of the asphalt from the French Asphalt Co.'s freehold mine at St. Jean-de-Maréjols, in the department of Gard, France:—

Bitumen	-	-	13·60
Carbonate of lime	-	-	85·00
Silica	-	-	·60
Oxide of iron	-	-	·20
Alumina	-	-	·10
Moisture	-	-	·30
Loss	-	-	·20

100'

The company are not over-stating the case when they say that the asphalt which has given the best results for paving purposes comes from France or Switzerland. There are very large deposits in Sicily, but the rock is of a sandy nature, while as regards German asphalts the following caustic remarks are made:—

"Many good things come from Germany and a great deal of asphalt, but the asphalt is not one of the good things. In Berlin, where more asphalt has been and is laid as pavements than anywhere else in the world, the only asphalt not allowed to be used is German asphalt. Not being wanted in Germany the German asphalt is shipped largely to England, but it is avoided by the wise. Berlin has more than 200,000 metres of its principal streets paved with French asphalt, supplied and laid by the French Asphalt Co. of London."

The pamphlet gives a good deal of information as regards the preparation and methods of laying asphalt, and we are glad to see that the company frankly admits that compressed asphalt needs constant traffic to keep it hard, and is therefore only suitable for pavements on which there is a constant stream of passengers or on roads subject to heavy traffic. For cases where compressed asphalt is unsuitable the company makes a special mastic asphalt, which is composed of the asphalt rock, with Trinidad bitumen added. This mastic asphalt is cheap, though quality has to be paid for, and no attempt can be made to compete on the question of price with mastics composed of naturally inferior materials. The following is a list of a few of the purposes to which mastic asphalt has been put by architects and engineers: Damp-courses (flat and vertical), roofs, gables, gutters, basement floors, stable paving, piggeries, cellars, vaults, tun-rooms, swimming baths, garden paths, reservoirs, granaries, lawn tennis courts, racquet courts, electric-cable troughs, insulation of all kinds, batteries.

The pamphlet concludes with a specimen specification for work in mastic asphalt that will be very useful. The address of the French Asphalt Co., Ltd., is 5, Laurence Pountney Hill, London, E.C.

Keystones.

Brentford Fruit and Vegetable Market is being extended at a cost of £50,000. The extensions cover 12 acres.

Mr. W. L. Griffiths, architect, has removed his offices from Oswaldestre House, Norfolk Street, to Oakley House, Bloomsbury Street, London, W.C.

A new Railway Station at Newburgh is to be erected. It will be much larger than the present one, and will depart from the custom in Scotland of using stone, a pressed brick being the material chosen.

Glasgow School of Art.—The syllabus for the next session has just been issued. A separate calendar of the School of Architecture gives the full curriculum of this section of the school and can be had on application to the secretary.

Cost of Cleansing and Lighting the City Bridges.—The cost of lighting, cleansing and repairing the four bridges across the Thames within the City was as follows last year:—London Bridge, £1,199; Blackfriars Bridge, £2,914; Tower Bridge, £15,814; Southwark Bridge, £1,066.

Brereton Church, Cheshire, has been restored. The church, which was built in 1450, was noted for its magnificent carved-oak panelled ceiling, but as a result of the ravages of the oak beetle this became unsafe. At a cost of something like £2,000 the ceiling has been replaced by an almost facsimile of the old roof.

A new Workhouse Infirmary at Otley is being constructed of Guiseley stone at a cost of £8,571. The woodwork in the interior is to be of pitch-pine, and the lower part of the interior walls will be tiled, with the corners rounded so as to prevent any accumulation of dust. Mr. W. H. Herbert Marten, of Bradford and Menston, is the architect.

Fire-resisting Corporation, Ltd.—This reconstruction of the old Non-flammable Wood and Fabrics Co. shows in its annual report for the past year a profit of more than £5,860, as compared with a loss of £4,700 made by the old company in 1903. No dividend, however, will be paid, as it has been found necessary to erect a new drying kiln and also to purchase more machinery.

A Mosque for London.—The idea of erecting a mosque in London appears to be maturing to a definite result. The design of Messrs. Chambers & Martin has been submitted to the Shah of Persia and has met with his approval. Mr. Chambers was the architect for the little mosque at Woking which elicited such high commendation from the Shazada when he visited it during his stay in this country.

A new Roman Catholic Church at Garston has been erected at a cost of £8,160. The building is of red Woolton stone with Accrington dressings. The roofs are covered with brindled tiles, and the building is warmed by low-pressure hot-water pipes and lighted by electricity. The architect was Mr. D. Powell, of Liverpool, and the contractors were Messrs. R. Wearing & Sons, of Liverpool; the clerk of works being Mr. E. Quirk.

New Tredegar Estate Offices have been erected at Pentonville, Newport, by Messrs. A. S. Morgan & Co., contractors, of Newport. The electric lighting and hot-water heating apparatus have been installed by Messrs. R. Alger & Sons, of Newport. The sanitary fittings are by Messrs. Doulton, of Lambeth; the lift by Waygood, Ltd., of London; the strong-room doors by the Ratner Safe Co., London; and the stable fittings by Musgrave, of Belfast. The exterior walls are of local stone faced with Chilmark freestone from quarries at Tisbury, Wilts.

Antrim County Courthouse is to be enlarged, and the tender of Messrs. R. Corry, Ltd., for £11,958, has been provisionally accepted. The plans have been prepared by Messrs. Young & Mackenzie.

A new Church at Norbury has been built in an octagonal shape with gallery. There are no pillars to obstruct the view, and no pews have been introduced. Tip-up seats are employed in the auditorium and the gallery.

Magnetic Observatory Buildings, Eskdalemuir.—A start will shortly be made with the erection of these buildings. The site is a very isolated one, and materials will have to be transported for miles by carts. Mr. W. T. Oldrieve, architect, H.M. Office of Works, Edinburgh, has prepared the plans.

"More Famous Houses of Bath and District."—Messrs. Meehan announce the early publication of this work, which will be a companion volume to "The Famous Houses of Bath and District," published so successfully in 1901. Its price will be 10s. 6d. nett, and the edition will be limited to 500 copies.

The Pavilion at Dunoon, opened by Princess Louise recently, faces the sea and has a row of shops in front with reception-rooms above, and at the back an octagonal-shaped assembly hall (with stage) capable of accommodating nearly 4,000 people. Originally the cost was to be £6,000, but the figure will now be fully £10,000.

Berry Pomeroy Church is to be further restored. The restoration scheme was commenced in 1878, when alterations costing about £3,000 were carried out. It is now considered necessary that some repairs should be done to the roof of the building, and also to restore the tower, whilst further restoration of the fifteenth-century screen is needed.

The Alexandra Theatre, Greenock, has been completed. The balconies are cantilevered, only two steel pillars being used in the auditorium. The auditorium measures 49ft. wide at the narrowest part and a little over 60ft. at the widest, and the distance from the curtain to the back wall of the pit is about 77ft. The height from stage level to roof at back of gallery is 56ft., and from stage front to ceiling at bottom of dome measures 40ft. A complete installation on the Reck system is supplied for heating. The theatre has seating capacity for about 2,000. The architects were Messrs. Boston, Menzies & Morton, of Greenock, and the contractors Messrs. Forrest & M'Leod, of Glasgow.

The Repair of Canterbury Cathedral.—The whole of the south face of the tower of Canterbury Cathedral has now been strengthened and solidified, and all dangerous parts effectively removed. The condition of the stonework has proved to be more serious than anticipated. In many places concealed fissures unexpectedly disclosed themselves, entirely filled with vegetable and animal life, the face of the stone often being separated from the core, and only kept in place in the most precarious manner. In one place an area was found of about six consecutive yards of continuously detached surface; and this mass of loose stonework was bound to have fallen ere long with disastrous effect. The buttresses prove not to be in all cases as solid as might be wished, large portions of them being cored with flint rubble. One of them was found to be split away from the main fabric from top to bottom, while, in another, sixteen courses of masonry were found to be without bond, sustained only by a slender and much decayed piece of stone. Work on the west side has just been commenced. Where possible the decayed stonework has been treated with baryta water. The entire work is estimated to cost £14,000. Mr. W. D. Caröe has the direction of it.

A new Roman Catholic Church for Stirling has been designed by Messrs. Pugin & Pugin, of London. The building is to seat 1,000 and will cost £12,000. It is of Decorated Gothic style, with nave, aisles, chancel and side chapels and ample sacristies.

New L.C.C. School of Arts and Crafts.—Plans are being prepared by the architect of the London County Council for the new Central School of Arts and Crafts, to be erected in Southampton Row, at an estimated cost of £73,700. The building operations will occupy two years and will be carried out by the Works Department.

Penistone District Isolation Hospital was opened recently. A scarlet-fever block has accommodation for eight beds, four for each sex, together with a nurse's duty-room, bath-room and convalescent room. The typhoid-fever block has accommodation for four beds, two for each sex, together with rooms as in the scarlet-fever block. Another block consists of washing and drying rooms.

Tarmac, Ltd.—By virtue of a special resolution of the Tar Macadam (Purnell Hooley's Patent) Syndicate, Ltd., to which the consent of the Board of Trade has been duly obtained, the name of that company has been changed to "Tarmac, Ltd." The registered office of the company is Spring Vale, Ettingshall, near Wolverhampton.

Mr. Stirling Lee and St. George's Hall, Liverpool.—The Liverpool City Council will to-day consider a letter from Mr. T. Stirling Lee in which the sculptor asks to be allowed to finish his life's work on the panels of St. George's Hall, Liverpool, whilst still in his best days. Should the Council not see its way clear to expend the small sum of £1,000 a year for six years, he then hopes there may be some citizen who will come forward to finish one part of "the finest modern building in Europe."

The Painted Hall at Greenwich has been thoroughly cleansed and renovated, with the exception of the ceiling, which was treated about twenty years ago. Many unsuspected details of Sir James Thornhill's paintings have been brought to light. A great improvement has been effected by the taking out of two "blind" windows in the upper hall and filling them with clear glass. The pictures have been thoroughly overhauled and rearranged by Mr. W. F. Yeams, R.A., the curator.

East London College.—The 1905-06 calendar of this college, which is situated in the Mile End Road, has just been issued. The Governors have decided to add an Arts site to the college course, and arrangements have been made for providing instruction for the arts examinations of the University of London. In this connection six scholarships—three for men and three for women—of the value of £40 per annum for three years, will be awarded on the result of the London Inter-Collegiate Scholarship examinations in Arts subjects to candidates between sixteen and nineteen years of age on October 1st, 1906.

An Architectural Impasse.—Architects have oftentimes difficulty in reconciling plans submitted by two parties. A gift by Mr. Caird of £16,000 to add a physical laboratory to the University College at Dundee led to the donor instructing his own architect to prepare plans for the block. The college council did not consider that the architect had kept in view the desire to have a homogeneous scheme of building for the college as a whole, and they asked Sir Rowand Anderson, who designed the new University buildings at Edinburgh, to advise. He suggested certain amendments on the plans prepared, but Mr. Caird, who disapproves, has now intimated that he may withdraw his gift.

STAINING SHINGLES.

American Methods Explained.

SHINGLES are not used to such a great extent in this country as they are in America, where they are almost invariably painted or stained. The latter is considered to be the most practical method of finishing them, and a few notes on the American practice may, therefore, be of interest.

When a shingle roof is painted it is almost impossible to avoid having some of the paint run down between the shingles, forming little dams that will hold back some of the water from every rainstorm, and this water will soak in through the edges of the shingles and will frequently cause them to rot. As a matter of fact, painting a shingle roof does not prolong the life of the roof at all, but tends rather to shorten it. Shingles that are left bare of finish will usually outlast a painted shingle roof. If however the shingles were dipped in paint before they were laid, then this objection would be overcome; but while such a method of finish would answer very well for a time, when renewal became necessary it would be impossible to avoid getting some of the paint into the spaces between the shingles.

Shingle stains not only offer a safe and convenient method of colouring shingles, but they are decidedly artistic, by reason of their soft effect, and also from the fact that the stain does not act absolutely uniformly on every shingle, nor indeed on every portion of the same shingle; hence there is a very pleasing play of colour upon the surface, although the general effect is uniform.

Varieties of Stains.

The two principal varieties of shingle stains are oil stains and creosote stains. The first consists of linseed oil with enough of the ordinary pigment tinting colours mixed with it to colour the wood, and a certain amount of drier. In other words, oil stains are a very thin paint used for dipping purposes. Even if they are brushed on, the body of the stain is not sufficient to cause dams of paint. Any painter can mix a satisfactory oil stain. The best colours to use are the non-fading earth pigments, such as umber and sienna, ochre, Van Dyke brown, Venetian red or lampblack.

Creosote v. Oil Stains.

Although anyone can mix a shingle stain using creosote as a vehicle, the term "creosote shingle stains" is a trade-mark and can be used only by the manufacturer who first introduced them. The advantages which creosote stains possess over oil stains is that they penetrate more deeply into the wood, and being very slow to dry, last longer. For this reason they protect the shingle better against dry-rot. Moreover, when shingles are dipped in creosote stain before laying, and are given another coat of the stain with a brush after being laid, mildew or fungus growth cannot establish itself upon the surface of the shingles, as is the case with oil stains having pigments of a mineral or earthy base.

A stain made from inert pigment, ground in oil, thinned with pine-tar, liquid drier and benzene or kerosene has been known to hold its colour well after an exposure of four years.

At the convention of the Ohio Association of Master-Painters and Decorators, held in Cleveland in 1903, the subject of shingle stains was discussed at some length. A well-known Toledo painter recommended a stain made from 2 gallons of coal oil (kerosene) to 1 gallon of raw linseed oil, tinted to any shade or colour desired. This he said would wear as well as any manufactured stain on the market, and would cost about one-third as much. Another member stated that he had mixed some shingle stain, using 1 lb.

of beechwood creosote to one barrel of crude oil and a small percentage of drier to prevent the colour from running. This was tinted with the best quality of pigment colour that could be bought, and the shingles dipped into this stain had held their colour for twelve years.

Ordinary linseed oil paints, thinned with benzene, have been recommended for shingle staining, but are not advisable, for although the colour holds out well the shingles are apt to show evidence of dry-rot.

Skilled labour is not necessary for dipping shingles. All that is needed is to have a large tub to hold the stain, which must be stirred every few minutes to prevent the pigment settling. Into this stain the shingles are dipped for not less than two-thirds of their length, and are then stood on end to dry, or rather to drain. The painters' unions, however, claim this to be painters' work, although any boy or handy man can do it. The second application of the stain, after the shingles have been laid, requires the services of a painter.

MINTO HOUSE.

How Plans and Details were Prepared 100 Years ago.

MINTO HOUSE, near Hawick, the Scottish home of the newly-appointed Viceroy of India, possesses a number of interesting features. The architect's name has been lost, though an old volume of the original plans of the house exist. These are neither signed nor dated, but are curious as showing the manner in which the working plans for a large house of about 130 years ago were prepared. The drawings are to the scale of $1\frac{1}{4}$ in. to 10 ft., with a few elevations of the sides of rooms, and plans of ceilings to $\frac{1}{4}$ in. scale. On the same sheets as the scale drawings, and sometimes on the back, are drawn in a scratchy ink-line full-size details of cornices, balustrades, Ionic caps, &c. For a Classic house the plan is unusual, being an L plan with a segmental portico partly filling the re-entering angle. This portico admits into a hall; on either side of which, and running the reverse way, are subordinate halls. The main hall again opens at the end into a circular hall containing a stair, and surrounded on the first floor by an arcaded gallery giving access to the bedrooms and bedroom corridors. On ground floor the circular hall opens on the one side into a large library and on the other side into an interesting octagon drawing-room with lofty coved ceiling. The interior, though not containing any works of art of remarkable importance, has that atmosphere which only generations of refinement can give. Since the return of Lord Minto from Canada the house has undergone extensive alterations and additions under the supervision of Mr. R. S. Lorimer, A.R.S.A., of Edinburgh. Electric-light has been installed throughout, the house has been heated, a large number of bathrooms introduced, and the kitchen and service wings of the house rearranged and rebuilt. Outside, an extensive sloping lawn has been altered and formed into a terraced garden with stone balustrades and steps.

A Roman Villa has been unearthed in the neighbourhood of West Meon, Hants. At present three rooms have been laid bare. In the first the flooring of tessellated pavement is remarkably perfect and unbroken. The design can be traced with ease. Blue, white and red are the chief colours employed, and there is an elaborate border and a central ornament of a circular and involuted design. The second room was apparently tessellated chiefly in white, but in the third the remains of a handsome border, mainly in black and white mosaic, can be seen.

Law Cases.

Charges against a Builder.—At the Norton (Malton) Police Court last week Anthony Lyons, of St. Peter's House, Norton, a well-known large builder and contractor, was charged with four offences under the Bankruptcy Act of 1869, namely, not disclosing, not delivering, concealing and fraudulently removing certain goods, the property of his creditors, on or about April 27th last. It was stated that during bankruptcy proceedings Lyons made the declaration that he had handed over the whole of his property and that he had concealed nothing, but it was ultimately discovered that about the time that he was calling his creditors together a large quantity of furniture and other goods had been removed from his house and concealed in the houses of some poorer neighbours, and also in a large barn or outhouse belonging to a neighbouring tradesman. The goods still remaining realized £146. At length Mrs. Lyons handed the trustee a key of the outhouse, and said that he would there find a lot of furniture but the greater part of it was her daughter's. The trustee seized this, and by auction it realized £61 3s. 9d. The gross assets of the estate were estimated at £2,857 13s. 9d., but the trustee said this would not be realized. The total amount of securities held by the creditors was £14,075, Lyons having carried out some big contracts. The Bench committed Lyons for trial at the next quarter sessions.

Contravening the By-laws.—George Taylor, of Camberley, Surrey, was recently summoned at the Wood Green Petty Sessions for contravening two of the building by-laws of the Southgate District Council. One of the offences was in respect of the thickness of the walls of two houses. The by-laws provided that if the building comprised more than two storeys the walls should be 13½ ins. thick below the topmost storey and 9 ins. thick above it. The topmost storey was defined in the by-laws as being the uppermost storey of a building, whether constructed partly or wholly in the roof or not or adapted for human habitation or not. A plan was submitted by the defendant, which received the approval of the Council, showing buildings of three storeys—ground, first and attic floor—with the wall 13½ ins. thick up to the topmost storey. Instead of this a wall of 9 ins. had been erected. The second summons alleged that the defendant had not carried up the wall of one of the buildings so as to form a parapet. It was stated that the by-laws required, for the sake of protection from fire, that there should be a parapet where a building was erected within 15 ft. of another building, but this was not insisted upon except where the space was less than 10 ft., the Model By-laws of the Local Government Board only compelling a parapet to be provided when one house was erected within 10 ft. of another. The defendant's plan showed a building about 10 ft. away from the house he proposed to put up, and the council would not have insisted upon the parapet being built if the plan had been complied with. But the house as erected was only 6 ft. 9 ins. apart from the other. In regard to the first offence it was contended for the defence that there were not three floors comprised within the walls, but the Bench decided otherwise. The second offence was not disputed, defendant stating that he was misled by a notice he received from the Council. Defendant had rendered himself liable to penalties amounting to £280, but on his undertaking to alter the buildings so as to comply with the by-laws the magistrates only fined him £5 and costs. They directed that the alteration must be carried out within two months.

Complete List of Contracts Open.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
BUILDING:			
Sept. 7	Croydon—School	Education Committee	J. Smyth, Clerk, Education Offices, Croydon.
7	Dinnington—Schoolroom	Trustees	Rev. H. Jones, Prospect Villa, Kiveton Park, Dinnington.
7	Bottom—Cottages	—	J. Sansom, Architect, Greenbank Lane, Liskeard.
8	Barry, Glamorgan—Coastguard Buildings	Admiralty	Civil Engineer, H.M. Dockyard, Pembroke Dock.
8	Waterford—School	Technical Instruction Committee	Secretary's Office, Town Hall, Waterford.
8	Chisleton—Houses	—	G. Martin, Chisleton, Wilts.
8	Hereford—Boiler-house, &c.	Guardians	W. W. Robinson, Architect, 10 King Street, Hereford.
8	Barnsley—Chapel Alteration	—	G. Moxon, Architect, 25 Church Street, Barnsley.
8	Chatham—Bath-room, &c.	—	County Architect, 86 Week Street, Maidstone.
9	Yeovil—Alteration to Schools	Education Committee	Samson & Cottam, Architects, 1 Hammet Street, Taunton.
9	Penarth—Alterations to Police-station	County Council	Glamorgan County Offices, Westgate Street, Cardiff.
9	London, N.—Cloakrooms	St. Pancras Borough Council	T. W. Aldwinckle, 20 Denman Street, London Bridge, S.E.
11	Lydney—School	Education Committee	M. H. Medland, Architect, 15 Clarence Street, Gloucester.
11	Ipswich—School	Education Committee	E. T. Johns, Thorongfare, Ipswich.
11	High Wycombe—School	Town Council	Borough Surveyor, Easton Street, High Wycombe.
11	Finsbury—Convenience	Council	Borough Surveyor, Finsbury Town Hall, Rosebury Avenue, E.C.
11	Bargoed—Cottage, &c.	—	Surveyor's Office, Knaresborough.
11	Knaresborough—Cattle Market	Council	F. Hayes, Architect, 24 Nassau Street, Dublin.
11	Brow Head, Ireland—Houses, &c.	Lloyd's	County Architect, 1 Richmond Road, Exeter.
11	Bratton Fleming—School	Education Committee	Price, London House, Church Street, Bargoed.
11	Birkby—Additions	—	Lunn & Kaye, Architects, 14 John William Street, Huddersfield.
12	Isleworth—Additions to Workhouse	Guardians	W. H. Ward, Architect, Paradise Street, Birmingham.
12	Esksdalmuir—Observatory Superstructure	H.M. Works Department	H.M. Office of Works, 3 Parliament Square, Edinburgh.
12	Hathern—Cottages	Co-operative Society	S. Smith, Tanners Lane, Hathern.
12	Chelmsford—Classrooms	Governors	C. & W. H. Pertwee, Bank Chambers, Chelmsford.
14	Messingham—School	Education Committee	Scorer & Gamble, Architects, Bank Street Chambers, Lincoln.
15	Rhymney—Houses	Victoria Building Club	J. Llewellyn, Smith & Davies, Architects, Aberdare.
15	Norton's Cross—Additions to Schools	Managers	A. Swash, Architect, Midland Bank Chambers, Newport.
15	Canterbury—Alterations at Asylum	Asylum Committee	W. J. Jennings, Architect, 4 St. Margaret's Street, Canterbury.
16	Redruth—Villa	J. Simmons	H. W. Collins, Architect, Clinton Road, Redruth.
16	Wallasey—Schools	Urban District Council	J. Holt, Architect, 9 Albert Square, Manchester.
16	St. Dogmael's—Additions to School	Education Committee	D. E. Thomas, Architect, 17 Victoria Place, Haverfordwest.
16	Llunabad—Temperance Hall	Committee	D. Conroy, Architect, 21 Shipquay Street, Londonderry.
18	Stockport—Union Offices	Guardians	C. F. Johnson, Clerk, Union Offices, Stockport.
18	Worthing—School	Education Committee	Borough Education Department, Worthing.
19	Sheffield—Alteration to County Court	—	H.M. Office of Works, Storey's Gate, London, S.W.
19	Birmingham—School	Education Committee	J. A. Palmer, Secretary, Education Dept., Edmund St., Birmingham.
20	Aylesbury—Schools	Education Committee	Clerks of Works Department, Education Office, Aylesbury.
23	Edinburgh—School	School Board	M. Carfrae, Architect, 3 Queen Street, Edinburgh.
23	Wrexham—Library	Town Council	V. Hodge, Architect, 13 Grand Parade, Teddington.
23	Barnstaple—School	Education Committee	G. W. F. Brown, The Square, Barnstaple.
No date	Allymynydd—Sanatorium	—	Architect, 4 Quay Street, Carmarthen.
ENGINEERING:			
Sept. 9	Upton Scudamore—Waterworks	Rural District Council	A. F. Long, Engineer, 53 Market Place, Warminster.
11	Lleata, Italy—Breakwater	Rural District Council	Public Works Department, Rome.
11	Beaminstor—Borehole	Municipality	Beesley, Son & Nicholls, 11 Victoria Street, Westminster, S.W.
11	Bruzio, Italy—Water-supply	North-Eastern Railway Co.	Municipal Offices, Fiumefreddo-Bruzio.
11	Sculcoates—Swing Bridge	Docks Committee	W. J. Cudworth, Engineer, York.
11	Bristol—Pumping Machinery	Urban District Council	W. W. Squire, Cumberland Road, Bristol.
12	Bishop's Stortford—Pumping Engine	Watch Committee	T. Swatheridge, Council Offices, 7 North Street, Bishop's Stortford.
12	Cardiff—Motor Ambulance	Urban District Council	J. L. Wheatley, Town Clerk, Cardiff.

The Council do not bind themselves to accept the lowest or any Tender.

By order of the Council,
 J. H. BANTOFT,
 Clerk to the Urban District Council.

Council Offices, Selby,
 Dated the 23rd day of August, 1905.

ELHAM UNION.

ASPHALTING PLAYGROUND, &c.

The Guardians invite TENDERS for properly REPAIRING the YARDS, PLAYGROUNDS, PATHS, &c., at the Cottage Homes, Cheriton, with reliable asphalt or other hard and durable material.

Persons tendering to specify how it is proposed to do the work, giving detailed quantities, with quality and description of the material proposed to be used, including any edging, kerbing, channelling, and levelling, &c., that may be necessary, the price to include all labour and materials, and the work to be completed to the satisfaction of the Guardians' Building Committee.

Tenders to be delivered at my office, as under, before the 15th SEPTEMBER.

R. LONERGAN,
 Clerk.
 11, Cheriton Place,
 Folkestone,
 18th August, 1905.

5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS.

OFFICE: 6, GREAT NEW STREET, FETTER LANE E.C.

Bankruptcies.

CAPE TOWN'S MUNICIPAL BUILDINGS.

THE new municipal buildings at Cape Town, opened a few weeks ago, have been erected from the designs of Messrs. H. A. Reid & F. G. Green, A.R.I.B.A., of Cape Town and Johannesburg. The builders were Messrs. T. Howard & F. G. Scott, of Cape Town; Mr. T. L. Wood acting as clerk of the works on behalf of the Council. The buildings are in the Italian Renaissance style, with grace.

ful Classical façades and a handsome campanile tower, 200ft. high, above the centre of the block. The exterior is of Monk's Park Bath-stone, with massive granite base. The external doors and window frames, and also the doors of the city and minor halls, are of teak. The roofs are covered with slate. The building has frontages to four streets and measures 294ft. by 173ft. The façade towards Darling Street has a central feature surmounted by a pediment rising 82ft. above pavement level, the wings on either side being about 60ft. high, surmounted by pedimented dormers and a high-pitched

roof. The structure is divided longitudinally, the municipal portion occupying the Darling Street frontage, and the part of the buildings more especially designed for public purposes fronting to Corporation Street and Longmarket Street, with the principal entrances from Corporation Street. The most striking feature is the grand or city hall, measuring 130ft. in length by 61ft. in breadth, and having a height of 55ft. An organ has been erected by Messrs. Norman & Beard, of London and Norwich, from specifications drawn up by Sir George Martin, organist of St. Paul's Cathedral.

THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

September 13, 1905. Vol. 22, No. 553.

6, Great New Street, Fetter Lane, E.C.

Summary.

A number of representative girder and stanchion connections at the new Ritz Hotel in Piccadilly are illustrated in this issue by special photographs; particular attention is directed to those where the girder is eccentric to the centre line of the stanchion. The partitions throughout the hotel are built of American hollow terra-cotta blocks 12ins. square and mostly 3ins. thick. The setting-out was done by the superintendent, the lines being marked with a trowel upon a coat of rough plaster on the concrete floors. (Page 146.)

The Goodyear exhibition of architectural refinements in mediæval buildings was opened last week at Edinburgh. The builders of the Middle Ages frequently studied effects intended to make their buildings more imposing and interesting to the eye, such as an illusive perspective in the apparent distance of the choir of a church, or the avoidance of a contracted appearance in the upper part of the interior by inclining the walls outwards. (Page 155.)

A party of about eighty visitors from Leeds, Bradford and the West Riding, including corporation officials and representative workmen, travelled to Letchworth recently in order to see the Cheap Cottages Exhibition. They do not seem to have been very much impressed with the exhibits from a practical point of view. (Page 151.)

New working rules have been accepted by the Operative Society of Stonemasons, and there is now no danger of a disturbance in the London building trade. (Page 151.)

An excellent book on hot-water heating, by Mr. Dye, has been published, price 8s. 6d. (Page 150.)

For the first time in this country reinforced concrete pipes are being employed for high-pressure water main at Swarsea. The pipes are constructed on the "Bonna" system and have a skeleton of sheet steel wound around inside and out with cross-shaped bars. Joints are formed with bitumen, covered over with concrete rings. The work is being executed by the Columbian Fireproofing Co., Ltd. (Page 158.)

The London timber market was steady during August, but prices for soft woods are unsatisfactory both to shippers and importers. It is hoped that the conclusion of the war in the East will develop better business during the concluding quarter of the year, and concomitantly will appreciably benefit the timber trade. Teak is scarce, and advices from India show that the output of the new season's trees from the forests will be so small that next year's shipments of European quality will be very inadequate to the demand. (Page 157.)

The Academy Thousands.

DESPITE all the criticism on the futility of an exhibition which is maintained on such one-sided and stereotyped lines, the Academy still draws its thousands of pictures, and the returns for the last exhibition show that, despite the new rule which now reduces the number of works which may be submitted by outsiders from eight to three, there are very much the same high totals as before. Altogether there were more than 11,000 works submitted by non-members, and of these only 82 were accepted outright, while more than 8,000 were rejected at once. Fifteen were condemned as inadmissible for various reasons, and the remainder, numbering 2,692, were chalked with the familiar "D." Of these doubtfuls 1,563 found places in the exhibition, together with the 82 accepted works and 187 by Academicians and Associates. Both in 1901 and 1902 there were more than 14,000 works submitted by non-members; in 1903, 13,653; in 1904, 11,162; and this year 11,153; so that the new rule has by no means materially reduced the labours of the selection committee. Sir Aston Webb was responsible for the arrangement of the architectural works this year. As to the number of the latter submitted we have no figures, but we may make a guess. There were 237 exhibits in the architectural room, and as altogether the exhibition included 1,832 works, the architectural exhibits were practically one-eighth of the total. Taking the number of works submitted by non-members at 11,000 and those accepted at 1,645, this means that one out of every seven was accepted. Of course we have no means of judging in what ratio this might have held good in regard to works of painting, sculpture and architecture, but we may hazard that about 1,600 architectural works were submitted—which is a pretty fair proportion, though we cannot say that the room was any more successful this year than it has been hitherto. The fact cannot be too often reiterated that so far as architecture is concerned the Academy regulation restricting the exhibits to drawings is a hopelessly mistaken one, because architecture is pre-eminently concerned with executed work and nothing is so satisfactory as photography for representing this. We have already pointed out that photographs are admitted in the Scottish art exhibitions, and there is every reason why they should be seen on the walls of Burlington House. The plea for their admission to the Academy has been made over and over again, but it is only by continually hammering at a time-ridden institution that one can hope for any glimpse of reform. The Chantrey enquiry shook up the Academy a

good deal, and maybe it is now in a little better frame of mind to consider possible alterations of some of its methods.

Building Law Cases.

It is one of the ambitions of the native in India to be concerned in a law suit, and if he can carry the matter to the very highest tribunal he regards himself, and is so regarded by his friends, as a man of importance and standing. A similar sort of spirit seems also to prevail in this country, judging from the cases which from time to time crop up in the courts. We refer more particularly to actions under the Building Act. The cases are generally very trivial matters in which a law suit might have been avoided if the demands of the authorities had only been met in a proper manner. It is as well to remember that, however much the anomalies of the by-laws may press upon an individual case, if we have any by-laws at all, they must be administered rigorously. But some people seem to take a special delight in running their head against a stone wall—with the inevitable result.

Under Pressure.

THERE was a case of an absent-minded man who, after lighting his pipe in a railway carriage, dropped the matches out of the window, thinking he was putting them back on the mantelpiece; but possibly the contractor in a story which reaches us from Ireland had more method in his forgetfulness. It appears that some house drains had to be tested. The engineer in charge found that the existence of a gulley and a very sharp fall between the manhole and the next opening prevented the water test being applied and, at the contractor's request, the smoke test was adopted instead; but the engineer stipulated it was to be under pressure and measured by a gauge. Everything was accordingly prepared, and in due course the smoke poured out of the soil pipe, but when the gauge was applied and the workman had pumped himself red in the face without any indication of his exertions on the gauge, the engineer became puzzled. The gauge was taken off and found to be in order. Then the workman started again, and "put his back into it," as requested. But still without effect. Then the gauge and length of pipe were disconnected and the engineer plugged the end of the pipe with his hand. Immediately the gauge flew round to 20. This puzzled him still more, but suddenly the contractor, who had been absent-minded enough not to be quite handy for answering questions, cried out: "Begorra, I forgot to plug the soil pipe!"

FIG. 1.

THE RITZ HOTEL.

IN this issue we give a further series of photographs and drawings in continuation of our illustration of the erection of the Ritz Hotel, Piccadilly, London. The previous articles of the series appeared in our issues for September 28th, November 2nd and 30th, 1904, and March 1st and 22nd, April 12th and May 24th last. The size and completeness of this building as an example of steel-frame construction typical of the United States, but still somewhat novel to Great Britain, will make it of considerable importance in any future consideration of the progress of building construction in this country, and therefore we are illustrating it somewhat fully. The fact that steel-frame construction has been adopted for several large buildings since the beginning of this job leads to the conclusion that frame-construction is coming rapidly into favour in this country for large commercial premises, and it was with the object of elucidating the foremost practice in a branch of construction which the architectural profession and building trades in future will have to study that we arranged this series of articles.

The building is now rapidly approaching completion. On p. 148 we illustrate the erection of the partitions, which are constructed throughout of terra-cotta blocks, or tiles as they are called in the States. These are 12 ins. square and of three different thicknesses—3 ins., 3½ ins. and 4 ins., the 3 ins. being the size mostly used; they weigh 10 lbs. each. These blocks can be very quickly erected, and are easily cut to fit corners or bends. The illustration shows exactly how the work is executed. At skirting level blocks of a more porous and softer nature are used, so that woodwork can be nailed to them. All the blocks have three air-spaces through them. The partitions are plastered with selenitic plaster and finished with Keene's. The ceiling over the corridors is double, there being a space of 1 ft. between the ceiling

proper and the false ceiling below (formed with "Mack slabs"). Through this enclosed space warm or cooled air will be forced for ventilation and heating purposes.

Hollow terra-cotta is an excellent material for interior walls for steel-framed buildings, on account of its lightness and soundproofness. The partition shown in the photograph is being set to a curved line.

The setting-out of the partitions was done by the superintendent, the lines being marked with a trowel upon a coat of rough plaster on the concrete floors. This plaster quickly set, and the marks were then indelible and not to be obscured by traffic of men and barrows, as chalk would have been, thus facilitating the work and securing accuracy.

These same partition blocks are also used as coverings to protect the steel columns from fire.

We publish below an explanation of the steelwork illustrations, written by the engineer who designed and has been responsible for this portion of the construction.

Notes on the Steelwork. By S. Bylander.

On pp. 152 and 153 is reproduced the third-floor framing plan. At the Arlington Street side the exterior wall is set back and carried on two roin. I-beams with flange plates. Section A-B indicates the method adopted for supporting the set-back wall and sloping roof. On p. 185 of the issue for April 12th last was published a photograph showing the girders near column No. 48. To the right of the plan are shown spandrel sections and a section through the smoke-flue. This latter is made of steel plates riveted together, and forms a circular shaft composed of several sections, lined with firebrick on the inside; it was illustrated on p. 148 of the issue

FIG. 2.

for March 22nd last. Expansion joints are provided at every floor level and the brackets are allowed to slide upon their supports. The space between the steel flue

FIG. 3.

FIG. 4.

FIG. 5.

FIG. 7.

STEELWORK CONNECTIONS AT THE RITZ HOTEL, PICCADILLY LONDON.

ERECTING PARTITIONS AT THE RITZ HOTEL, PICCADILLY, LONDON.

and the walls is used for ventilation. It has already been explained how to read the framing plans in the issue of May 24th, in connection with the reproduction of the second-floor framing plan.

Trusses are placed between the first and second-floor levels in order to carry the part of the building over the dining-hall.

A shop detail drawing of one truss is shown on the opposite page. This truss is placed in partition walls, and door openings are provided through the truss at both ends under the large gusset-plates connecting the diagonal parts with the top cord. The two other trusses are similarly arranged. The trusses rest on columns Nos. 37, 55, 52, 54, 37 and 35. The loads from the trusses are applied about 7ins. out of the centre of the columns. The connections between the trusses and columns are very simple and thus facilitate erection. The top cords of the trusses are calculated for compression and bending. The bending is due to the weight of wall and floor, *i.e.*, the top cords act as floor girders at the same time as members of these trusses. The sum of the stresses exerted by compression and bending is less than 15,000lbs. per sq. in.

Fig. 7 shows the connections between a channel column and I-beams. On each flange side rests a compound girder 15ins. deep and on the near web-side an I-beam 12ins. deep. It should be carefully noticed how the beams are supported on angles and stiffeners. The number of rivets required in the stiffener-angles is calculated in accordance with the loads. The connection on the web side is the standard adopted throughout for 12in. I-beams.

Fig. 5 is a photograph of an exterior column to the court. In the background can be seen the smoke flue. The connection here illustrated is of two I-beams 15ins. deep resting one on each flange side of the column,

and a compound girder 12ins. deep on the web side. The width of the compound girder was too great to allow it to be placed in the channel, and therefore a gusset-plate was introduced, connected to angles riveted to the flanges of the column. When beams do not frame into the column centrally, it is sometimes difficult to obtain good connections; but if the system shown in Fig. 5 is adopted good connections can be obtained. One of the 15in. beams resting on the bracket on the flange side of the column is 7ins. out of the centre line of the column.

Fig. 4 shows a case where two deep beams are both out of the centre. The beam shown at right angles to the flange of the column is connected to and rests on a seat-angle only, but the beam at right-angle again to this is web-connected to a large gusset-plate on which the bracket with stiffener-angles is placed.

Figs. 1, 2 and 6 show the construction of brackets for different cases of framing.

Fig. 3 shows connections at the sixth-floor level, where the supports for the pavilions start. The ends of the hip-rafter were milled to dimensions for skews in two directions, and fitted exactly. To the left of the hip-rafter the mast of the guy-boom derrick used for hoisting stone can be seen. The signalling man is standing on a platform cantilevered out. In the background small derricks for setting stone are to be seen.

The importance of good and safe connections between columns and beams or girders is often ignored, but it should be remembered that the safety of a building is dependent on its weakest points; if one connection breaks it may cause the whole structure to collapse. If the factor of safety of the beam itself is 4 and for the connection is 2, the factor of safety for the structure should be considered as 2. It is more economical

to make the connections stronger than the beams. The collapse of the Darlington Hotel, New York, was due to poor connections between beams and columns.

OUR PLATE.

THE house at the Gallows Conduit, Coombe, for Mr. Valentine Knapp, is to be erected on a fine site overlooking Epsom and Banstead Downs. The materials are to be soft red bricks, red tiling for the roofs, and the external woodwork painted white. Decorative leadwork is to be introduced on the bays and executed from the designs of the architect, Mr. A. Jessop Hardwick, F.R.I.B.A., of Kingston-on-Thames. The hall will be panelled and a special feature will be made of an open staircase. The rainwater heads and gutter between bays are to be in lead.

Change of Address.—Mr. W. H. Ansell, architect, has removed his office from Great James Street to No. 18, Guilford Street, Russell Square, W.C. (opposite the Foundling Hospital).

Serious Condition of Winchester Cathedral.—The cathedral architect (Mr. J. B. Colson), the diocesan architect (Mr. T. G. Jackson, R.A.) and the consulting engineer (Mr. Francis Fox) have delivered to the Dean and Chapter their report as to what should be done to the eastern end of Winchester Cathedral, which is in a very dangerous condition, the south-eastern walls being more than 1ft. out of plumb. The mischief has been growing to such an extent that the whole of that end is being shored up pending the consideration of the steps to be taken to restore the building. The north-eastern end of the cathedral is also weak, and the whole of the crypt is shored up to prevent cracking.

Keystones.

The Quadrangle of Burlington House is to be paved with wood.

Mr. Ryan-Tenison, F.R.I.B.A., has been appointed consulting architect to the South-west Diocesan Schools Association.

The Organ at Winchester Cathedral is being cleaned and renovated by Messrs. Heel. It is hoped that the work will be finished by the end of the month.

New Slaughter-houses at Glasgow are to be erected on Merkland grounds, Whiteinch. The scheme, including the construction of cooling-rooms, cold stores and quays, will cost about £100,000.

The Simplex Steel Conduit Co., Ltd., of Westinghouse Building, Norfolk Street, Strand W.C., have just issued a new price sheet giving in a condensed form most of the prices in their 1905 catalogue.

A Hotel of Forty-two Storeys is to be erected in New York by a building corporation possessing a capital of £1,000,000. The new building will have 500 rooms, with dining- and ball-rooms on the top floor and Turkish swimming baths in the basement.

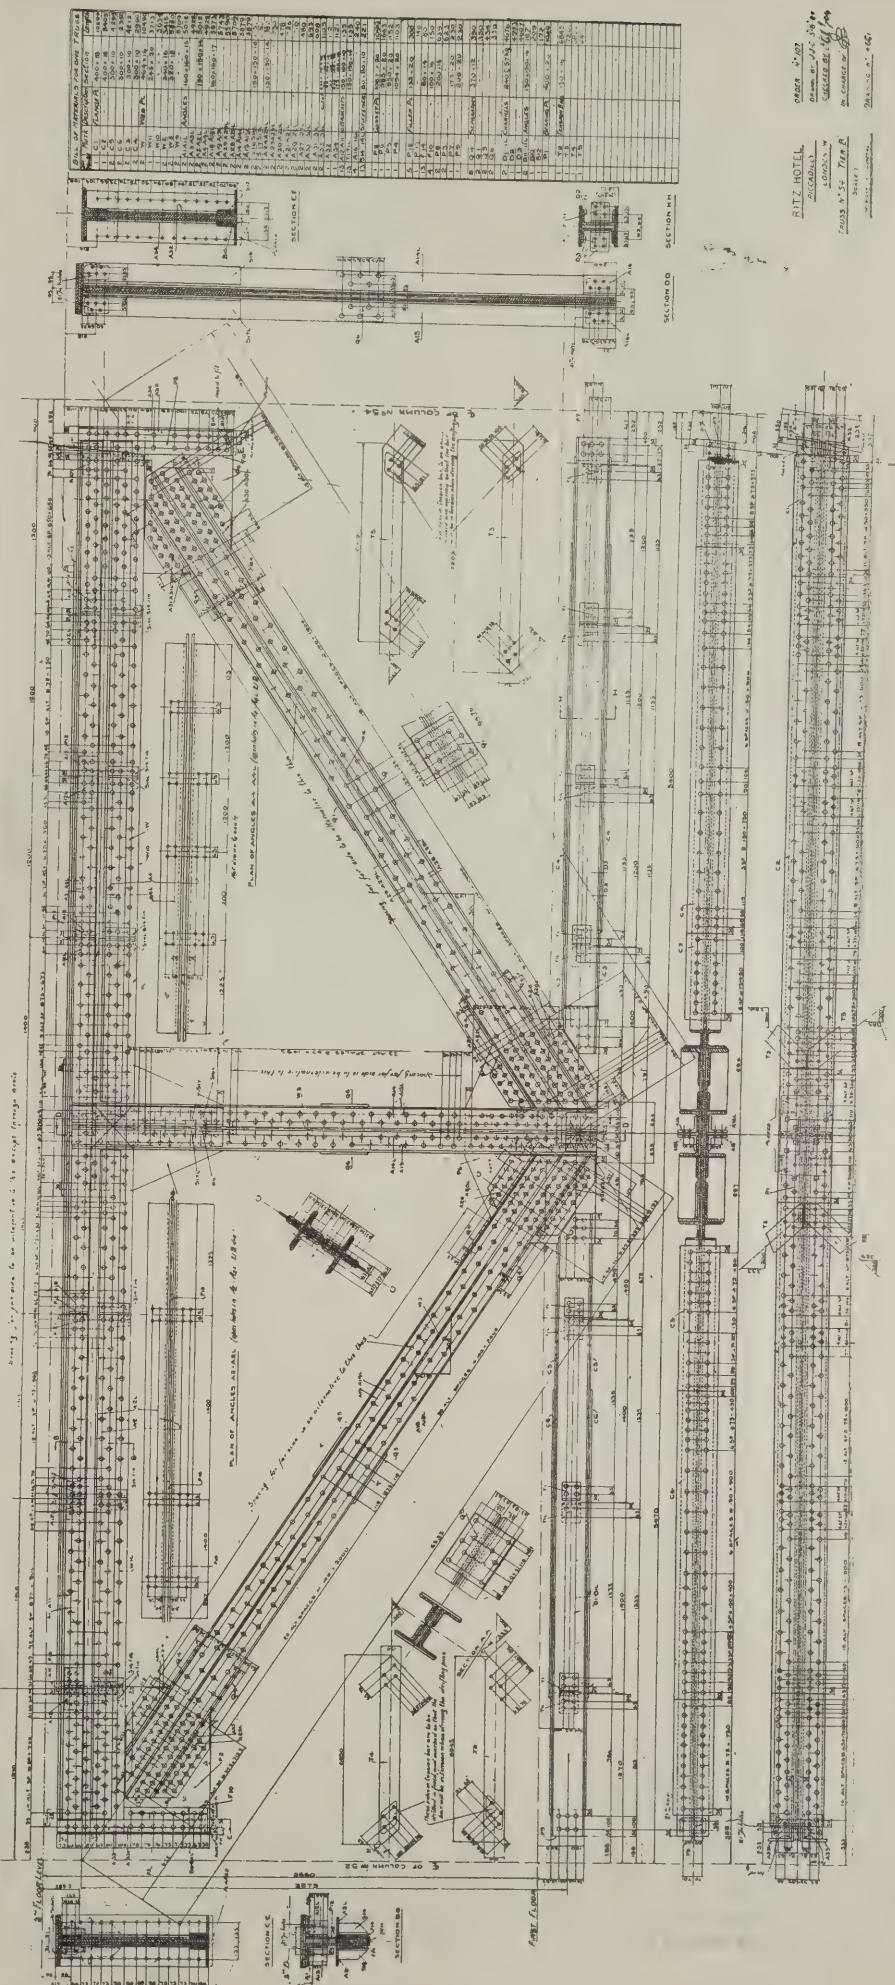

Mr. Stirling Lee and St. George's Hall.—At last week's meeting of the Liverpool City Council Mr. Stirling Lee's letter in regard to the completion of his sculpture work at St. George's Hall (see p. 143 of our issue for last week) was merely taken as read.

Cleaning the Law Courts.—The walls and ceilings in the corridors of the Royal Courts of Justice are being thoroughly cleaned for the first time since 1882; also the ventilation in the King's Bench Courts II., V., VIII. and IX. is being modernized.

The A.A. and the Royal Architectural Museum.—The accounts for the adaptation of the old Royal Architectural Museum in Tufton Street, Westminster, to the purposes of the Architectural Association state the contract of Messrs. Holloway Brothers to have been £8,111 and the legal expenses, the fees of the architect (Mr. Leonard Stokes), furniture and fittings £1,100—a total of £9,211. Towards this amount donations (with interest) amounting to £7,420 have been received, and promises totalling to £761 are outstanding, leaving a sum of £1,030 still required.

Eccles Parish Church: Ancient Part Crumbling.—The whole of the ancient part of Eccles Parish Church is in need of repair. Mr. F. P. Oakley, architect, of Manchester, who has examined the building, says the stonework generally has reached the point where further decay will be much more rapid than it has been up to now, and that the clearstory ought to be taken in hand at once. The water is now finding its way in, and that means rapid and certain disintegration. Mr. Oakley thinks the cost will probably be about £2,000, and of this the officers of the church ought to spend £1,000 without delay.

Roman Pavement at Dorchester.—A short time ago some Roman tessellated pavement was discovered on the site of the new Primitive Methodist schoolroom in Durngate Street, Dorchester. As this was of considerable interest the council of the Dorset County Museum decided to preserve it. They accordingly commissioned Messrs. B. Ward & Co., Ltd., of Parliament Street, Westminster, to take it up and relay it in cement on the floor of the museum, next to the piece of pavement discovered in Olga Road, which was also removed and relaid by Messrs. Ward, whose Italian workmen have had considerable experience of such work. The relaying and polishing of the Durngate Street pavement has now been completed and gives entire satisfaction.

Views and Reviews.

Practical Gilding.

This is a very good practical book on gilding, bronzing and lacquering which should find its way into the hands of a large number of students and craftsmen. All branches of the work are dealt with, concisely and clearly, and a useful summary is given of the preparation of the various metals employed in gilding, both as leaf and powder. In referring to copper leaf the author takes occasion to mention that this might be more extensively used in decoration, by reason of its rich colour and lustre, and the permanence to be secured by lacquering.

We can recommend this book to all who want to know how all kinds of "gilding"—used in its widest sense—are carried out. The author is lecturer on decoration to the City and Guilds of London Institute and the London County Council.

"Practical Gilding, Bronzing and Lacquering," by Frederick Scott-Mitchell. London: Trade Papers Publishing Co., Ltd., 365, Birkbeck Bank Chambers, W.C., price 3s. nett.

Pumps.

In this volume the author briefly describes the various types of pumps, supplementing the letterpress by a number of diagrams and photographs of examples by different makers. To the architect the book is of no special interest, except in so far perhaps as concerns hand- and wind-power pumps. The objection to the latter is of course the uncertainty of the motive power, but as against this there is the minimum of cost for working and maintenance, and also the possibility of

employing tanks or reservoirs to hold three or four days' supply in order to cope with the vagaries of the wind. Chain pumps worked by wind engines are sometimes used for raising water from quarries and brick-yards, and to empty the workings; they are also very useful on estates where water collects to a considerable extent. Electric motors are coming more to the front for pumping purposes; but, as the author observes, the essential condition for their use is the possibility of obtaining current at a reasonable cost. The chief advantage of electric motors is that they are always ready for work, so that no time is lost in starting. We have already drawn attention to this fact in connection with the use of electric hoists on building works.

"British Progress in Pumps and Pumping Engines," by Philip R. Björli. London: Archibald Constable & Co., Ltd., 16, James's Street, Haymarket, price 6s. nett.

Academy Architecture.

The first part of "Academy Architecture" for 1905 is to hand. Naturally, such a publication, so well known to our readers and now in its seventeenth year, does not call for very much detailed comment; and we can only say that, as usual, it is admirably printed and that the plans throughout are clear and uniform. A large number of the exhibits in the architectural room at this year's Academy are included, together with drawings and photographs of work exhibited at the Royal Scottish Academy and the Royal Glasgow Institute of the Fine Arts, while in the latter part of the book are some photographs of sculpture and of work abroad. Among this last is a very interesting design for the Quirinal Tunnel at Rome. Two coloured plates by John Nash (1809–

1878), respectively of a chimneypiece in the drawing-room of Speke Hall and of the chapel at Ightham Mote, are included in the volume; both being very successful as examples of colour printing and draughtsmanship.

"Academy Architecture and Architectural Review, 1905." London: 58, Theobald's Road, price 4s. nett (paper covers).

A Standard Book on Hot-water Heating.

The subject of ventilation and heating is generally treated in its twofold aspect, and as such has been dealt with in numerous books. Usually, however, far too much space has been devoted to the theoretical and abstract side of the question, and very often the practical work has been described in a way savouring of the professor rather than of the working plumber and heating engineer. In the volume now before us Mr. Dye has wisely avoided the familiar treatment, and the result is that his book will find a place among standard treatises, not so much among "text-books," prepared for cramming students for examination, as among those very good books which deal exhaustively with their subject while not being too diffuse, and are written by people thoroughly conversant with the practical methods of execution in vogue. Beginning with a chapter on the laws of heat, the author proceeds to describe the circulation of hot water in pipes, and then explains in detail a hot-water heating apparatus. Low-pressure for brick buildings is then considered at length; after which follows a chapter on the heating of glass-houses and horticultural buildings; then a brief chapter on quantities, followed by one on the testing of heating plant when the outdoor temperature is more than 32 degs. (this last being a paper read before the Institution of Heating and Ventilating Engineers, for which the author was awarded a bronze medal). Drying-rooms are described, and Mr. Dye then goes on to deal with air in pipes, loss of heat, &c. Boilers and radiators are fully dealt with, after which the high-pressure system is explained, and at the end of the book comes a chapter on the warming of buildings by heated air, this last subject being divided into two parts, namely, warming by air that has received heat by passing over encased hot-water or steam radiators, and warming by stove-heated air. At the end of the book is an appendix giving tables and figures useful to heating engineers. The author points out in regard to boilers that he has not found it necessary to alter the new table of actual heating values he set up in the earlier editions of Hood on Warming Buildings; and although boiler-makers have not as yet based their calculations on figures quite as low, there is no gainsaying that they might with advantage do so, "for it is everywhere recognized, even among themselves, that something should be done, and will eventually be done, to give boilers more precise catalogue values than they now have."

The book is essentially practical, written by an acknowledged authority, and will be found of great service to architects, heating engineers and students.

"A Practical Treatise upon Warming Buildings by Hot Water," by Frederick Dye, M.R.I.E. London: E. & F. N. Spon, Ltd., 57, Haymarket, price 8s. 6d. nett.

Terry's Theatre, in the Strand, has been reconstructed inside. The Strand stairs to the upper circle and gallery have been rebuilt, a new stage roof has been erected, improvements have been made in the dressing-rooms, the small private boxes at the rear of the dress circle have been removed and the space thrown into the dress circle, with a walnut screen at the back, a new installation of electric light has been carried out, and the whole theatre re-decorated and re-upholstered. Mr. Frank Matcham was the architect in charge.

Builders' Notes.

Sheffield Builders, Ltd.—This company is to be wound up.

The Welsh Slate Trade, which has suffered by reason of the importation of French slates, has received a benefit by material reductions in the L. & N.W.R. rates to inland towns.

Iona Marble.—A Swedish firm has taken a lease of the old white and serpentine marble quarry on Iona Island (Argyll). Mining operations will be commenced next spring.

Sunderland Building Trade Dispute Settled.—The dispute in the building trade at Sunderland, which has lasted for fifteen weeks, has been settled by compromise. Work was resumed on Friday, the builders' labourers receiving 6½d. per hour and the bricklayers 9½d.

Master House-Painters and Decorators: Convention and Exhibition at Plymouth.—The National Association of Master House-Painters and Decorators will hold its twelfth annual convention and exhibition at Plymouth from September 19th to 23rd inclusive. The Guildhall has been secured for the purpose of the exhibition and meetings, and there is expected to be a large gathering from all parts of England and Wales. Mr. H. Vigurs Harris, of Plymouth, is the president. At the conference on Wednesday, September 20th, Mr. G. C. Haité, R.I., will deliver an address, Mr. W. Whitelaw will read a paper, and Mr. E. A. Bramley, headmaster of the Manchester association school for teaching decoration, will speak on "Methods of Training for Decorators."

Messrs. Patman & Fotheringham, Ltd., of 101 and 102 Theobald's Road, W.C., and Islington (managing director Mr. James F. Parker), have secured the contract for the alterations and reconstruction of the Avenue Theatre, Northumberland Avenue, which is to be done for Mr. Cyril Maude. The theatre will be re-named The Playhouse. Messrs. Patman & Fotheringham have also secured the following contracts:—The new Carnegie library, Mile End; the new Carnegie library, Manor Gardens, Islington; Messrs. Spalding & Hodge's new offices, Drury Lane, W.C.; the Talbot Restaurant, &c., London Wall, E.C.; and several others, amongst them being work for Lady Winchelsea at Haverholme Priory, Lincolnshire, the Earl of Dunraven at Connaught Square, W., and Mr. Leopold Albu at Hamilton Place, Park Lane, W.

A Visit to the Cheap Cottages Exhibition at Letchworth was paid recently by seventy or eighty visitors from Leeds, Bradford and the West Riding, including the Bradford Corporation Building Committee, over thirty medical officers from the West Riding, the members of the Leeds Corporation Plans Committee and the Unhealthy Areas Committee, and more than twenty representative workmen selected by the Leeds Co-operative Society. Summing up his general conclusions after a very careful examination of the houses, Alderman F. M. Lupton, chairman of the Unhealthy Areas Committee, said: "They are certainly no use for Leeds, and I do not think they are any good for outside the city. Some of the houses might suggest possible improvements in the better class of workmen's houses to be erected in Leeds, but none of the houses had advantages as compared with those already built on the Ivy House estate in Leeds. The only use these houses could be to us would be in case Leeds was to start building a garden city outside the present city boundaries. But many of the houses would not satisfy the by-laws, as in Leeds they insist upon all bedrooms, except attics, being not less than 9ft. high, and the bedrooms in nearly all

PRIMARY SCHOOL, BOSTON, MASS. J. A. SCHWEINFURTH AND J. J. CRAIG, ARCHITECTS.

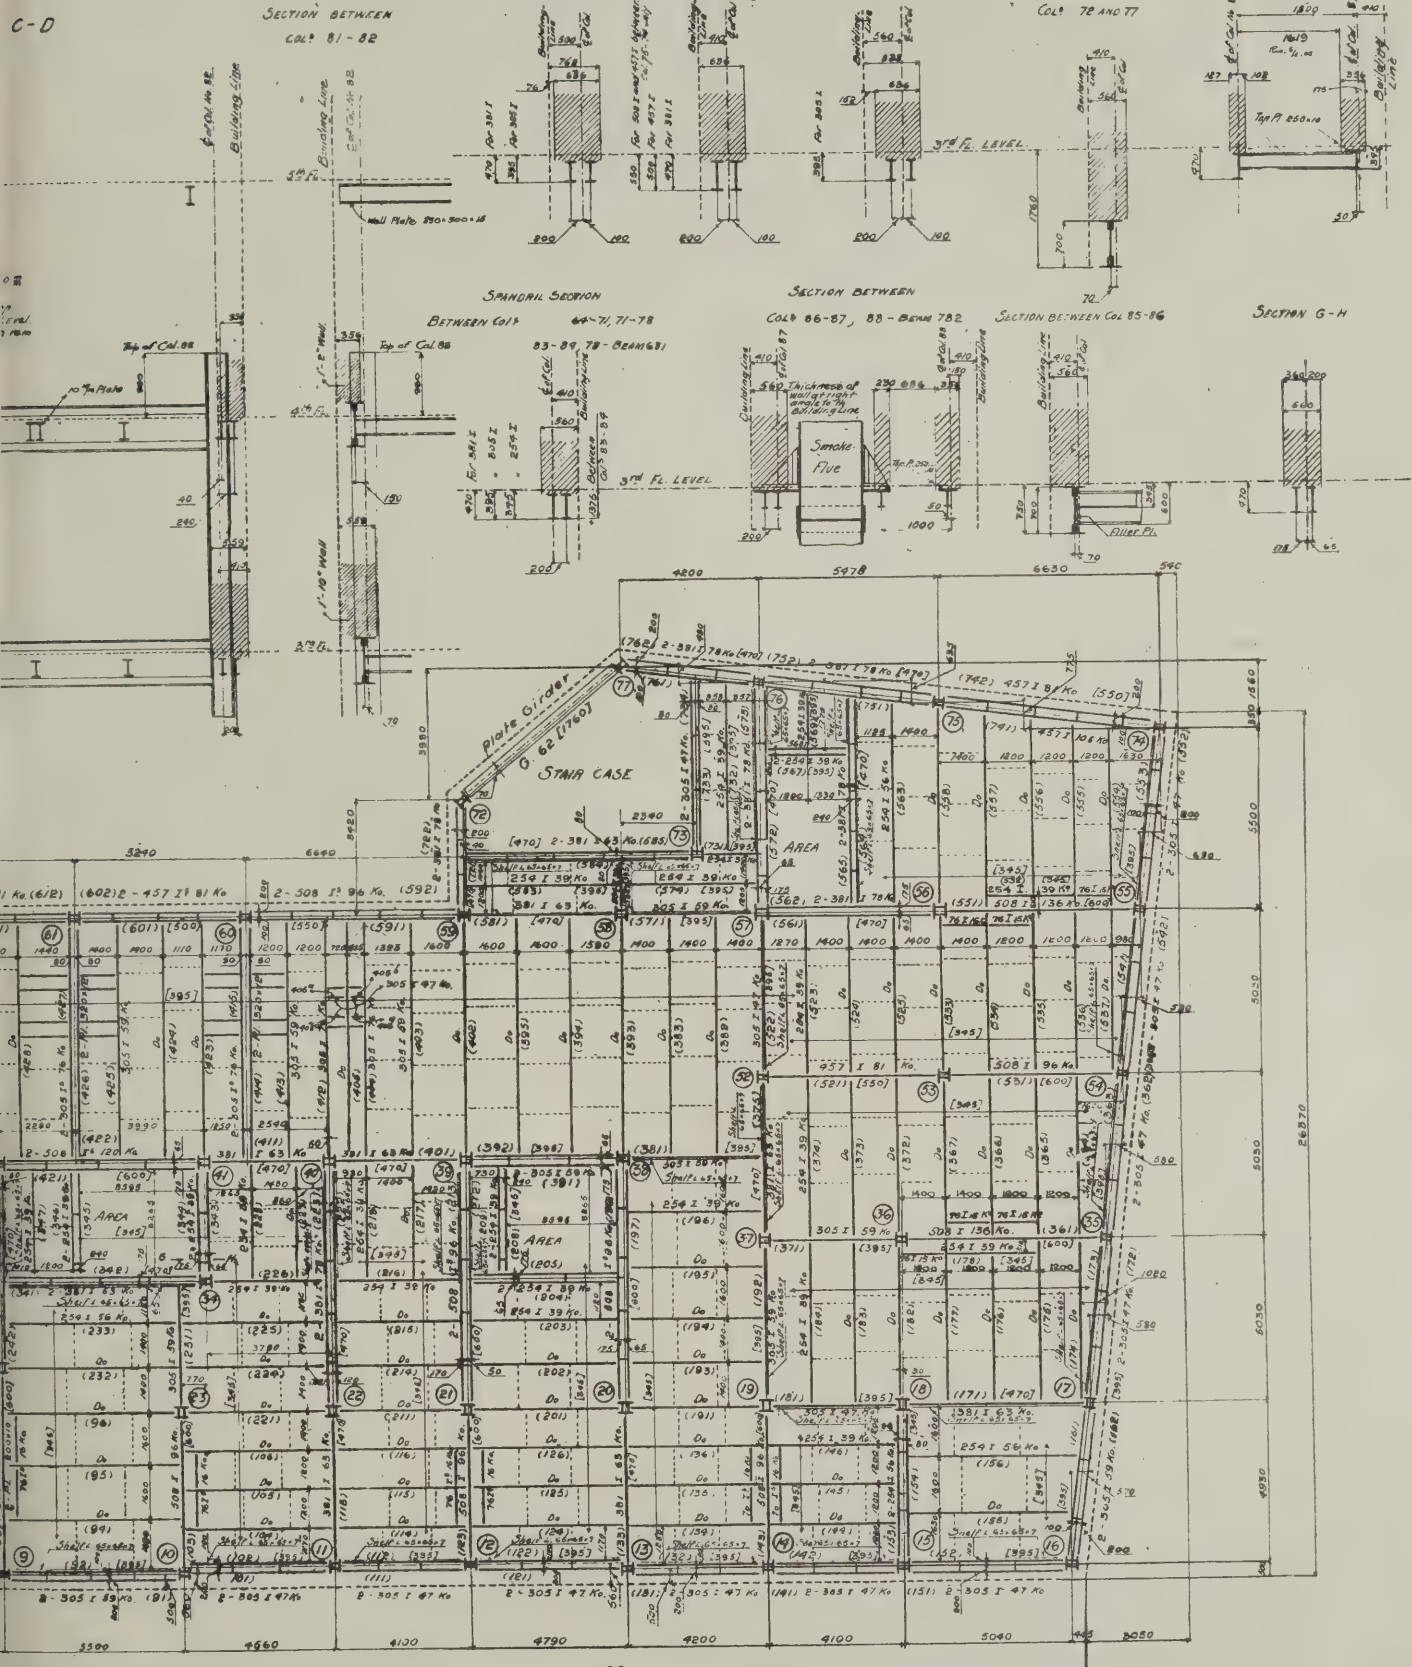

these exhibition cottages were only 8ft." On this point, however, Alderman Lupton was not sure that the Leeds law refusing to recognize anything lower than a third-storey room as an attic was altogether wise or reasonable. Another criticism he had to offer was that in a great many cases ventilation and light, especially in the bedrooms, had been sacrificed for what was supposed to be artistic effect.

Two Building Collapses.—An enquiry was held last week on the death of a workman named Hood, aged 29, who died as the result of injuries received by the collapse of a number of iron roof principals, weighing a ton each, which were being fixed recently at an extension of the Brentford market. James Cureton, foreman for Messrs. Colley & Cureton, of Trafford, Manchester, stated that he had charge of the ironwork which his firm were erecting for the Griffin Iron-works, of Birmingham. There were seven principals fixed and bolted securely, and he could not account for the work giving way. Walter Paggett deposed that he bolted the end principal securely. Mr. Longhurst, representing Messrs. Dorey & Co., the builders, said that if properly bolted he would not expect such a collapse. There was no wind, but there might have been vibration from a passing traction engine. The jury, in returning a verdict of "accidental death," expressed the opinion that the iron was not bolted. They added a rider that they considered there was negligence in not having the work properly fastened, and considered the man Paggett should be censured for the way he

had given evidence.—On Wednesday last at the foundation-stone laying of a new Baptist chapel at Ebbw Vale a portion of the scaffolding (about 30ft. long) upon which fifty or sixty people were standing collapsed, precipitating them to the ground 12ft. below. Twelve persons were injured. The accident was due to one of the stays breaking.

New Working Rules: Acceptance by Stonemasons.—The acceptance by the Operative Society of Stonemasons of the new working rules, after certain important concessions by the employers, brings half the trade unions in the building industry into agreement with the London Master-Builders' Association, who had given notice to terminate the existing agreement and had formulated new proposals. It is now believed that there is no danger of a disturbance in the industry such as appeared probable when the movement first commenced. No alteration in the present rate of wages is to be made, and the employers concede the amendment suggested by the operatives that there shall be one hour dinner instead of half an hour during the last three weeks of the winter work, and that the hour rule shall apply to work in shops as well as on jobs. They also withdraw their request for optional opening at 6.30 a.m. in winter, and for permission to otherwise vary the hours under "reasonable circumstances." A further important concession limits the night work, at the rate of 1d. an hour addition to the ordinary rate, to nine hours a shift. The London district is altered to mean within twelve miles of Charing Cross, instead of ten as formerly.

DRAWING N° 8

Correspondence.

Expansion of Concrete Floors.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In reference to the continued correspondence on this subject allow me to trespass once more on your space. Mr. Thomas Potter, in his very interesting letter, appearing in your issue for August 30th, expresses surprise that "limestone which in fire is rapidly converted into carbonate of lime is the best material for fireproofing." I did not actually say that it was, but presuming Mr. Potter really means that the carbonate of lime (CaCO_3) in the limestone is, by fire, converted into oxide of lime (CaO), I admit that this change does take place when unprotected limestone is subjected to sufficient heat to drive off the carbonic-acid gas. At the same time I have proved by experiment that limestone in concrete, gauged in the proportion say of 3 or 4 parts stone, 1 or 2 parts clean sand, and 1 part cement, is not affected by fire to any appreciable extent, for the reason that each particle of stone becomes covered with a protecting skin of sand and cement, and is thus rendered fireproof in exactly the same way as steel in ferro-concrete.—Yours truly,

W. A. T. FLITTON.

WELLINGBOROUGH.

PAINTS AND PAINT-WORK.—V.

(Continued from p. 27, No. 544.)

VEHICLES.—II. Turpentine.

THE function of turpentine is to act as a thinner, i.e., to so dilute the oil that the paint will spread over a larger surface and therefore be in contact with more oxygen, the drying agent. Turpentine, although it increases the drying action, does not itself act as a dryer, for such a substance must import oxygen into the oil. Properly speaking, turpentine is a solid or semi-resinous secretion obtained from trees, generally the coniferous kind, but the term is commonly applied to the spirit or oil of turpentine obtained from the solid form by distillation. The solid turpentine consists of a mixture of one or more true resins, resinous acids in which oxygen is present, and one or more liquid hydro-carbons, called chemically terpenes. These liquids are obtained by distilling the crude turpentine alone, with water, or in a current of steam. The solid left behind is resin or colophony. There are many varieties of oil of turpentine, but in the English market we are chiefly concerned with only three, namely, (1) American, (2) French, (3) Russian and Swedish, though the second is mostly consumed in France. The first is obtained from the *Pinus australis*, the swamp or Georgia pine, and from the *Pinus taeda*, the loblolly pine. French turpentine is obtained from the *Pinus maritima*, while the Russian and Swedish is obtained from the *Pinus sylvestris*, or Scotch pine, and the *Pinus ledebourdii*. These several varieties render commercial turpentine slightly different in composition and properties.

The swamp or Georgia pine of America grows in large forests in North and South Carolina, Georgia and Alabama. Carolina is the producer of the greater amount of American turpentine. The solid resinous turpentine is obtained in the winter from November to March. Cavities are cut in the trees about 1 ft. from the ground, and the sap when it begins to flow about the month of March collects in these holes and is removed. Another and better method is to collect the sap in glazed earthenware cups attached to the trees. This yields more turpentine and does not destroy the life of the tree.

The distillation of the crude turpentine is performed in a still, built with a fire under and a steam pipe passing through. The fire is first lighted, and when the temperature reaches a little above 100°C . the steam is let into the still. The oil of turpentine goes over with the steam and both condense together in a worm condenser. The resin left in the still is run off by a tap into barrels.

The maritime pine grows in the southwest of France, in the departments of Landes and Gironde. The trees are tapped in February and March, the sap being conducted into earthenware vessels. After five years' successive tapping the trees are allowed a few years for recovery. The French process of extraction is slightly different to the American. The resin is first melted at about 96°C . and the impurities allowed to settle; it is then placed in the still in measured quantities, and the temperature raised to 135°C . by means of a fire, when steam is injected. The volatile turpentine and steam is condensed in a worm, and the product allowed to stand until the water has settled to the bottom, when the turpentine is skimmed off. The resin residue in the still is run off and screened from dirt and grit. The oil of turpentine obtained is a little over one-fifth the amount of the crude resin. The French method is distinctly the most scientific.

Swedish and Russian turpentine is obtained very much in the same way as the American—that is to say, rather crudely.

The terpenes have the general formula $\text{C}_{10}\text{H}_{16}$, but they consist of a number of isomeric compounds, and the three varieties of turpentine on the market consist of mixtures of terpenes in varying proportions. Practically speaking, the turpentine-oils contain two terpenes only, namely, pinene and sylvestrene. Pinene, however, has two varieties, differing from each other in their action on a ray of polarized light; one is called lævo-pinene, and the other dextro-pinene.

American oil of turpentine contains both varieties of pinene, dextro-pinene predominating. French turpentine consists of lævo-pinene. Russian and Swedish turpentine consists chiefly of sylvestrene.

Pinene is a colourless liquid having a specific gravity of 0.86 and boiling at from 155°C . to 156°C . Sylvestrene is also colourless and liquid, with a specific gravity of 0.84 and a boiling point of 175°C .

French and American turpentines have a specific gravity ranging from 0.864 to 0.87, usually about 0.867, and begin to boil at from 150°C . to 160°C ., completely distilling at 170°C . They will flash at 36°C . to 38°C . and burn with a smoky flame.

Russian and Swedish turpentine has a specific gravity ranging from 0.862 to 0.873 and begins to boil at about 156°C ., completely distilling below 180°C ., the greater bulk at 172°C . to 174°C .

Oil of turpentine on exposure to air absorbs oxygen, slowly in the case of French and American and more rapidly in the case of Russian and Swedish. This oxidation renders the turpentine thick and viscid by the production of a resinous substance, which remains on exposure, part volatilizing away. When spread on a surface, as in paints, in a thin layer the larger proportion of the turpentine volatilizes, the residue being more completely oxidized than when in bulk and becoming hard. American turpentine has a greater absorbing power than French. With Russian and Swedish turpentine the more rapid absorption of oxygen and greater viscosity due thereto leaves a surface somewhat tacky for a time. This resinous residue left by turpentine upon drying acts as a binder for pigments, and in this respect differs from other spirits used in paintwork and its substitutes.

French and American turpentine when exposed to air in contact with water forms

a crystalline product having the composition $\text{C}_{10}\text{H}_{16}\text{O}_2$, named Sobrerol. Russian and Swedish turpentine oxidize in air into a substance called camphoric peroxide, with composition $\text{C}_{10}\text{H}_{14}\text{O}_4$. A peculiar property of this turpentine is that when heated with watercamphoric acid, $\text{C}_{10}\text{H}_{16}\text{O}_4$, and hydrogen peroxide, H_2O_2 , are formed, and this is availed of for the production of the well-known disinfectant "Sanitas."

The frequent adulteration of turpentine and the many substitutes for this very necessary diluent of paints render their consideration important, and in the next article of this series we shall deal with this branch of the subject.

(To be continued.)

A LINCOLNSHIRE CHURCH AND SAXON ARCHITECTURE.

A DOUBT having been expressed as to the antiquity of Marton Church tower, Lincolnshire, the vicar (the Rev. I. H. Mallinder) wrote to the "Times" stating it was thought by experts highly probable that a Saxon church was built at Marton about 625, of which only the tower remains. "The late Bishop Trollop, who was a great authority on architecture, was of opinion that our church tower dated back to at least the eighth century. The Saxon church was replaced by an early Norman church built soon after the Norman Conquest, about the end of the eleventh century. The chancel arch is a beautiful specimen of early Norman work. The aisles and porch appear to have been rebuilt in the early part of the fifteenth century. The fine early Saxon 'rope' work masonry referred to by Prof. Brown is not built into the walls of the tower, but into the walls of the fifteenth-century part of the church. Thus these beautifully carved Saxon stones have been built into the walls of the church in order to preserve them, and are now in good preservation. The restoration of the tower is very urgent, and we are doing all we can locally to raise sufficient money to do the work, but as the parish is so very poor we are obliged to appeal for outside help."

As addition to the foregoing Prof. Baldwin Brown points out that the so-called "Lincolnshire" towers possessing Saxon features must be late in the style; first, because, taking Europe as a whole, the architectural type they represent and many of their features are comparatively late ones, and, next, because in England the distinctive features of these towers occur in some cases, as at Hornby, Yorkshire, in association with Norman or later characteristics. In the special case of Marton we have the fact that some herring-bone masonry in the tower, seen above in the interior, is curiously like some early Norman work at Tamworth Castle.

The Goldsmiths' Training College, New Cross, is to be altered and largely added to for the Delegacy University of London and St. John's College, Battersea, for the Governors and Council. Mr. A. H. Ryan-Tenison, F.R.I.B.A., is the architect.

The Tower of All Saints' Church, Asfordby, near Melton Mowbray, is in a dangerous condition. Mr. Goddard, architect, of Leicester, reports that it appears to have been cemented all over at some period with a view to arresting the decay. This cement has almost disappeared, except on the upper stage, where it remains fairly complete on all faces. The interior of the bell stage has also suffered seriously, and the arches supporting the haunches of the spire are cracked and much weathered, and in one place the stability has been endangered by cutting away stone to make room for the frame of the Jubilee bell. The cost of restoration is estimated at £346.

ARCHITECTURAL REFINEMENTS: VIEW LOOKING UP THE SOUTH-WEST PIER AT THE CROSSING OF THE CHURCH OF ST. QUENTIN.

THE GOODYEAR EXHIBITION.

Architectural Refinements in Mediaeval Buildings.

THE collection of photographs and surveys of architectural refinements in mediæval buildings in Europe brought together through the researches of Mr. W. Henry Goodyear, M.A., curator of Fine Arts in the Brooklyn Museum, is now on exhibition at the National Portrait Gallery, Queen Street, Edinburgh, the exhibition having been opened on Wednesday last by the Earl of Wemyss. As our readers are aware it is under the auspices of the Edinburgh Architectural Association. A very admirable catalogue has been issued in connection with the exhibition, containing a number of photographs of notable examples, including those of St. Mark's, Venice; the cloister of the Celestines, Bologna; Pisa Cathedral; Amiens Cathedral; Notre-Dame, Paris, &c. The studies represented by the exhibition began at Pisa in 1870, but were then discontinued till 1895, when the Brooklyn Museum of Arts and Sciences undertook the prosecution of the investigation, and a qualified architectural surveyor and engineering expert, Mr. John W. McKecknie, was selected as assistant to Mr. Goodyear. The results of the investigation are certainly very interesting. The architectural refinements practised by the Greeks—such as the curvature of the entablature and stylobate and the inclination of the columns of the Parthenon—are well-known, but it is worth

noting that our knowledge of these is only comparatively recent. Cockerell first noticed the Greek entasis in 1810, and Pennethorne discovered the Greek horizontal curves in 1837, but the scientific resolution of the whole matter was left to Penrose as late as the middle of the last century. With mediæval architecture we are not accustomed to associate architectural refinements of a similar nature to those of Greece, but everything seems to show that such refinements undoubtedly exist. The case is very well stated in the catalogue before us, and we cannot do better than give the following argument put forward by Mr. Goodyear:—

“Modern architecture has gradually drifted since the close of the sixteenth century into a mechanical formalism of mathematically exact symmetry and monotonous repetition of details. This formalism contrasts very unfavourably with the work of older periods. This older work was very largely dependent upon accidental conditions and causes for its more spontaneous, more varied and more picturesque character. The difference between old and modern work is largely determined by changes in social organism and business system, which have eliminated the accidental element. Aside from this accidental element the builders of the Middle Ages frequently practised predetermined and carefully considered constructive arrangements, which were intended to make their buildings more imposing, more attractive and more interest-

ing to the eye. In certain cases optical effects were undoubtedly studied, such as an illusive perspective in the apparent distance of the choir, or the avoidance of a contracted appearance in the upper part of a church interior. In other cases it may be a debatable point how far optical effects were studied, or how far the simple principle of the agreeable and picturesque effect of varied arrangements may serve as explanation.”

In illustration of the subject we give the accompanying view looking up the south-west pier at the crossing of the Church of St. Quentin, showing the vertical westward curves for the transept. These features are uniform in eight piers, and as it is difficult to conceive a single pier as being bent by thrust in two directions at right angles to one another in this regular manner, and still more difficult to conceive of a uniform occurrence of this “accident” in eight piers, one is led inevitably to the conclusion that the curvature was made with intention of architectural refinement. The illustration is taken from the exhibition catalogue, and we are indebted to Mr. H. W. Resmond, editor of the “Architectural Record Magazine,” of New York, for its use.

THE NEW SESSIONS HOUSE.

THE walls of the new Sessions House in Old Bailey, built of huge blocks of Portland stone, already appear above the network of scaffolding, and the central dome is rapidly attaining its complete height of more than 200ft. Surmounting the dome will be a bronze figure of Justice. The stonework is expected to be finished in less than three months' time. Inside, most of the marble slabs extending up to the springing of the dome have already been placed in position, while the pendentives bearing sculptured figures are nearing completion. Running north and south out of the central space beneath the dome are wide corridors lined with polished marble, and leading out of these corridors are the entrances to the four courts—two small and two large. Each court will be provided with a public balcony with an exit in Newgate Street. Ample light will be admitted through a dome-shaped roof of opaque glass. Each court, also, will possess its own suite of rooms for the accommodation of counsel, jury, the Press, witnesses in waiting and for private consultations. The courts throughout will have oak dadoes. The main staircase of marble is not yet completed. On the second floor are most of the rooms which will be used as offices by the staff. From the windows can be seen the two courtyards dividing the building. The walls of these courts are faced with white-glazed bricks. It is interesting to note that in one of the courtyards the bricks are built on to a part of the old London Wall, discovered while the excavations were in progress. On this floor is a large dining-hall and an adjoining smoking-room, the kitchens being at the top of the building. This section of the building on the south side is well forward and the mosaic flooring is being laid. From the ground floor a stairway leads down to the cells—upwards of 100 in number and constructed on the usual lines, with doors opening out on to a long passage. In the basement is the ventilating plant. Eight large fans will drive the air into a long circular duct, from which it will be forced through flues to every cell and room in the building, the extraction being through outlets on the roof.

Mr. E. W. Mountford, F.R.I.B.A., is the architect of the building. Mr. Pomeroy is executing the decorative sculpture; and Sir William Richmond and Professor Moira will paint some lunettes inside. The building will be opened in November, 1906.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Assistant Architect and Surveyor, Office of Works.

HORSHAM.—R. J. B. writes: "Please advise me as to how to obtain an appointment as assistant architect and surveyor in H.M. Office of Works."

Full particulars of this examination may be obtained by applying to the secretary of the Civil Service Commission, Burlington House, W. H. M.

Skelton Church, Yorks.

BRADFORD.—C. E. M. writes: "Would Skelton Church, near York, be accepted as a building to be measured for Final testimony? Would it be suitable and not too difficult? How many sketches and notes on the progress of buildings are usually sent in?"

Measured drawings of Skelton Church, Yorkshire, would make a most excellent subject for a Final testimony of study. This church is small and rather uninteresting in plan, having no chancel or aisles, a fact which renders the measurement of the plan a very simple matter. The detail, however, is exceedingly rich and will take some time to measure properly; but it will be found that many of the mouldings are repeated in various parts of the church, and so the labour of measuring is less than would seem at first sight. The church was restored in 1847, but for the most part faithfully, except the vaults, which, however, are designed in keeping with the rest of the church; the south porch is particularly fine and makes an excellent subject for a sketch, especially if the door be opened and a view of the internal piers be included. There is a very interesting tradition in the parish of Skelton to the effect that the church was built of the stones that remained after the building of the south transept of York Minster, to which the character of the work corresponds very closely. The date of completion of Skelton Church is fixed absolutely by an entry in the Roll of Archbishop Walter Grey, which assigns it to the year 1247. A very fine set of sketches and measured drawings of Skelton Church was published shortly after its restoration in a book entitled "Skelton Church," by Ewan Christian, and issued by George Bell, 186, Fleet Street. A copy of this work is to be found in the library of the R.I.B.A. If you have a large number of sketches, you had better make a selection of the best; if a few, send them all in. If you send in too many they will not all be seen, while if you send in only a few the examiners may think you have been wasting your time. This same remark applies to notes on the progress of buildings.

H. Y. M.

Pozzo's "Perspective."

BIRKENHEAD.—H. E. F. writes: "Some time ago I picked up a book on perspective by Andrea Pozzo. It is fairly old, dating back to Queen Anne, and gives drawings of all the Orders of architecture in perspective. Is it valuable?"

Pozzo's "Perspective" is only worth a few shillings. Mr. Batsford, of 94, High Holborn, has two or three copies he would be glad to sell for 7s. 6d. each.

CROWN BREWERY, NEW ORCHARD STREET, BATH. SILCOCK AND REAY, ARCHITECTS. (Royal Academy Exhibition, 1905.)

Buildings to Measure in Hampshire.

HARTLEY WINTNEY.—S. P. writes: "Please name some architectural subjects near here suitable to measure for the R.I.B.A."

The following buildings, in the neighbourhood of Hartley Wintney possess suitable features for measuring and sketching:—Winchfield Church, the nave of which is Norman and the chancel Early English; All Saints' Church, Odiham, which has Early English, Decorated and Perpendicular portions; and the churches at Alton, Basingstoke, Basing and Bramshot, which are all Perpendicular. There is also a church at Hartley Wintney, but it has been very much restored. In this district are Bramshill, a very fine Jacobean mansion built 1607-12, and Hackwood, built to the design of Inigo Jones.

H. Y. M.

What is a Cross-wall?

PETERSFIELD.—H. T. K. writes: "In the Model by-laws a 'cross-wall' is said to determine the length of external or party-walls in regard to the thickness required, but there is no definition of a cross-wall, neither do 'Knight's Annotated By-laws' explain the matter. Would a cross-wall be correctly defined as a wall extending from one external wall or from one party-wall to another external or party-wall? Could a length of return wall of the required thickness terminated by a half-brick partition be legally considered a cross-wall? And how would the doorway next the wall whose length is to be determined by the cross-wall affect the question? Sketch sent (not reproduced)."

I am of opinion that both the walls shown in your sketch can be properly described as cross-walls—though I am not aware of any direct legal decision on the subject. The

definition given in the first schedule of the London Building Act, 1894, of what is not a cross-wall may be of interest to you: "No wall subdividing any building shall be deemed to be a cross-wall unless it is carried up to the floor of the topmost storey, and unless in each storey the aggregate extent of the vertical faces or elevations of all the recesses and that of all the openings therein taken together does not exceed one-half of the whole extent of the vertical face or elevation of the wall." F. S. I.

Distemper peeling off Damp Walls.

LEICESTER.—J. F. J. G. writes: "Which is the way to prevent distemper peeling off an old plastered wall that is damp?"

You should use one of the damp-resisting preparations now supplied by washable distemper manufacturers as a first coat and then apply a washable distemper.

Removing a Church to Another Site.

Mr. F. E. L. Harris, A.R.I.B.A., of Alderley Edge, Cheshire, writes as follows in reference to the enquiry under the above heading on p. 140 of our issue for last week: "I very well remember the taking down (for street improvement) of the fifteenth-century church of St. Werburgh, at Bristol, and its removal to a suburban site at Mina Road. This took place about twenty-five years ago. The stones were carefully taken to the new site and refixed, new ones only being used where found necessary. The church is a good example of the period named, with a fine tower of the Somersetshire type. I do not remember the name of the architect who superintended the removal and erection of the building."

Cream Rough-cast; Hoop-iron in Foundations.

BRIXTON.—J. J. writes: "(1) What are the best materials, proportions and method of laying to produce a rich cream-coloured rough-cast of fairly even surface, and would any precautions be necessary to carry out this work during frosty weather? (2) How should hoop-iron bond be used in footings to hold walls together when building on a clay foundation?"

(1) We suggest the use of clean sharp pea-gravel, Portland cement, Bath stone dust and powdered whiting, with a small amount of ochre to give tint. The proportions should be 2 Portland cement, 1 gravel, 2 Bath stone dust, $\frac{1}{10}$ th powdered whiting. The joints should be raked out and the brickwork cleaned and thoroughly wetted; the rough-cast should be mixed in small quantities and dashed-on with a trowel, or better a piece of board shaped with a handle. The work ought not to be done in frosty weather, and fine nights should be waited for. The precaution should then be taken to cover the work with sacks or matting.

(2) We do not see the advisability of using hoop-iron bond at all. If the foundations are proportioned so as to have the same load per unit of area, the building will settle uniformly. The foundations should be concrete, plain or reinforced, and the footings should start therefrom in regular offsets. If hoop-iron bond were introduced it should be placed longitudinally in the centre of each brick and crossed by short transverse pieces likewise placed in the centre of each brick. This would ensure the pressure being evenly distributed over the whole area, but such a precaution would be seldom necessary. There is, however, the patented system of the Fireproof Partition and Spandrel Wall Co., of 92, Tooley Street, S.E., in which hoop-iron is introduced horizontally and vertically in walls so as to render them self-supporting over small spans, so that foundations are only required under the supporting piers, wooden pillars or stanchions that occur at intervals and corners, and to which the hoop-iron is fastened longitudinally.

THE TIMBER TRADE.

London Market in August.

LAST week we published a special report of the Liverpool timber market during August. We now give a report of the London market.

The trade for the month was steady. The overside deliveries, to which some attention may be paid at this time of year, have been good, and the reduction in the dock deliveries as compared with last year amounts only to about 900 standards. Taking the two together, there is a credit balance in favour of this August of 1,200 standards. Messrs. Churchill & Sim report that the importation from Sweden has been a large one, but this has been fairly counterbalanced by an unusual reduction in the quantities arriving from the Russian ports, so that the dock stocks may still be reckoned at, say, 18,000 standards less than at this time last year. Prices were rather more than maintained throughout the month, but it has to be remembered that they are nevertheless altogether unsatisfactory both to shippers and importers. Swedish shippers are trying hard to raise them, and to some extent succeeding, but at the cost of doing very little business. Russian shippers are rather taking advantage of this, and a considerable amount of Russian business was effected during the month for autumn shipment away from London, but at rates entirely in the buyers' favour. Freights continued steady, the tendency towards the usual autumn stiffening being rather nominal.

Messrs. Denny, Mott & Dickson, Ltd., express the opinion that the conclusion of the war in the East will serve to strengthen the wide expectation that the concluding quarter of the year will develop general business in all directions, and will, therefore, appreciably benefit the timber trade.

The abstract of dock stock, consumption, &c., for August, published by Messrs. Foy, Morgan & Co., is given in the table at the foot of this page.

Dock Stock.

The stock of wood in the public docks on August 31st was:—

	Pieces.
Foreign deals and ends - - -	1,735,000
Do. battens - - -	2,372,000
Pine deals and battens - - -	951,000
Spruce do. do. - - -	777,000
Boards, rough - - -	3,735,000
Do. prepared - - -	7,045,000

Totalling 16,615,000 pieces, as compared with 18,284,000 in 1904, 18,466,000 in 1903, and 22,050,000 in 1902.

In other kinds the stock was as follows:—

Foreign wainscot logs - - -	173 pieces.
Do. oak timber - - -	921 loads.
Do. fir timber - - -	661 do.
Do. Oregon pine, &c., spars and masts - - -	3,633 do.
Colonial oak timber - - -	1,302 do.
Do. birch timber and planks - - -	5,991 do.
Do. elm and ash timber - - -	641 do.
Do. yellow pine - - -	671 do.
Do. red pine - - -	94 do.
United States pitch-pine timber - - -	13,867 do.
Do. do. deals - - -	39,000 pieces.
East India teak - - -	7,548 loads.

The deliveries for the first eight months have been:—

	Pieces.
Foreign deals and ends - - -	2,070,000
Do. battens - - -	3,880,000

	Pieces.
Pine deals and battens - - -	705,000
Spruce do. do. - - -	974,000
Boards, rough - - -	3,597,000
Do. prepared - - -	10,119,000

Totalling 21,345,000 pieces, as compared with 23,215,000 in 1904, 24,809,000 in 1903, and 25,794,000 in 1902.

The deliveries for August

have been:—

	Pieces.
Foreign deals and ends - - -	232,000
Do. battens - - -	415,000
Pine deals and battens - - -	63,000
Spruce do. do. - - -	92,000
Boards, rough - - -	393,000
Do. prepared - - -	1,078,000

Totalling 2,273,000 pieces, as compared with 2,387,000 in 1904, 2,442,000 in 1903, and 2,832,000 in 1902.

Deliveries from Ship to Craft.

The deliveries direct from ship to craft for the first eight months of the year have been:—

	P.s.h.	P.s.h.	P.s.h.	P.s.h.
Deals and battens	79,015	74,435	75,364	73,391
Boards - - -	16,785	13,565	16,191	16,865
Total - - -	95,800	88,000	91,555	90,256

and for August:—

	P.s.h.	P.s.h.	P.s.h.	P.s.h.
Deals and battens	15,185	13,961	20,154	22,612
Boards - - -	3,593	2,590	2,585	2,697
Total - - -	18,688	16,551	22,739	25,309

Soft Woods.

Swedish Deals and Boards.—Messrs. Churchill & Sim report that there were considerable arrivals of wood-laden ships from the Swedish ports in August. A large proportion of this importation has been delivered overside for more or less direct consumption, and the remainder has not overtaken the rather feeble powers of the market. Prices for deals and battens, therefore, may be said to have been a point better than in July. Deals remain unfashionable, and will only realize even present current values when really up to the mark as to quality and condition. In London such deals are none too plentiful, and many recent low prices are to be accounted for by faults of this description. Prepared boards have arrived in considerable quantities, and it has been difficult to prevent a further fall in prices. For the Cape the demand does not improve, and such specifications as are required for are very deficient in deal sizes.

Norwegian Boards.—The importation of Norwegian flooring boards was comparatively large in August, and the demand not being strong it has not been easy to maintain prices. The market has just about held steady, but with an inclination to fall under the July rates rather than in any way to recover from them.

Russian Deals.—The arrivals during August from the Russian ports were quite unusually light. Merchants here have been too much occupied with their early purchases to think of fresh business, and shippers have turned to other markets rather than send goods to London unsold. Much of the stock that has come to London has been very faulty, shaken and stained; and hardly affords any criterion of what the market might be for deals properly answering to their description. Claims have been heavy and numerous, and their settlement has been difficult and costly. Something of the prevailing political unrest has shown

itself in difficulties at sawmills and loading places, which have told severely against shippers in their endeavours to carry through their contracts. With all this, prices in London were quite fully maintained and on the whole were better than they were in July.

Finnish Battens.—The importation in August was quite normal, and, with a light stock, prices for battens were easily maintained and were perhaps a little better than they were in July. Here, again, much depends on quality and condition; a bright, square parcel of 2ins. by 4ins. will fetch quite a respectable price as things go, but they are not sent to London much, and the difference between them and the stained and waney scantling of which we see so many is a larger one than shippers will appreciate. 2ins. by 3ins. are out of favour for the moment. All whitewood is improving.

Prussian Timber.—The arrivals of fir timber from Prussia have been rather more in evidence than of late, but they have not been kindly welcomed, and prices are a little lower than before. Oak timber has been held with unusual firmness, the stock being in small compass, but the demand has fallen away very much, and if any quantity was sent here prices could not be maintained.

Canadian Timber.—The Canadian pine deal market in London was disappointing last month. The supplies were fairly large, very costly, and very difficult to move into consumption. Prices gave a little where there was any attempt at pressure, but for the most part sellers were quietly waiting for some signs of a demand. For spruce deals the market was firmer, more in sympathy with other markets and the general improvement in all whitewood, than from any increase in the demand in London. This movement looks like gathering force as the autumn proceeds, unless checked by shipments from Riga. Elm and ash timber are a point or two better since July. Birch has been selling cheaply in consequence of an over-supply. Oak and yellow-pine timber are without change. From the pitch-pine ports the only addition to the London supply in August was about 1,500 loads of sawn timber, so that previous deficiencies are not helped and the stock is the smallest for many a year past. Unfortunately, the demand is in much the same condition, and the timber is moving out of the docks very slowly; but notwithstanding this it has been realized that prices are too low, and there has been quite a smart lift in the market, say 2s. 6d. a load or more. Deals also are short in stock, and although the demand is fitful, prices are up a point or two.

American Whitewood.—First quality is weaker in consequence of increased imports, while the supply of the lower grades is far in excess of the demand; prices range from 2s. 3d. to 3s. 6d. per cub. ft. for first quality, 1s. 9d. to 2s. for clear saps, 1s. 6d. to 1s. 9d. for medium, 1s. to 1s. 2d. for culls. Logs are not wanted.

Hardwoods.

Teak.—Messrs. Denny, Mott & Dickson, Ltd., state that the landings in the docks in London during August consisted of 556 loads of logs and 401 loads of planks and

ABSTRACT OF STOCK, CONSUMPTION, &c., FOR AUGUST.

S.C. Dks. and M. Dks.	Deals (Fir).	Battens (Fir).	Pine.	Spruce.	Pitch-pine Deals.	Deals and Battens in Aggregate.	Rough Boards (All Countries).	Flooring.	Floated Timber.
	Pieces.	Pieces.	Pieces.	Pieces.	Pieces.	Pieces.	Pieces.	Pieces.	Loads.
Public dock stock	1,478,829	2,588,318	951,066	777,259	38,214	5,833,686	3,724,433	7,044,748	19,500
Monthly public dock consumption	208,915	459,189	64,820	93,531	6,846	833,301	396,386	1,107,835	2,287

Duration of supply at same rate of consumption	5'98 months.	5'19 months.	10'16 months.	6'66 months.	5'58 months.	5'94 months.	7'27 months.	4'58 months.	8'53 months.

scantlings, or a total of 957 loads, as against 432 loads for the corresponding month of last year. The deliveries into consumption were 215 loads of logs and 172 loads of planks and scantlings—together, 387 loads, as against 788 loads for August, 1904. During August the market was very inactive. Consumers naturally only buy from hand to mouth at the present high level of price. The advices from India continue to accentuate the fact that the outget of the new season's trees from the forests will be so small that next year's shipments of European quality must be very inadequate to the demand. Good quality wood must, therefore, continue to advance in cost; whilst, seeing that the quality will not be sufficient to "go round," consumers who do not promptly cover their requirements well forward will be driven to supply their needs from inferior shipments. China and Japan, however, are now absorbing such immense quantities of such second-class wood that it is very doubtful if much of even this description can be counted upon for shipment to Europe unless against special orders for execution a long time ahead.

Mahogany.—The arrival of the first cargo of the new season's wood from Honduras has brightened the market, and prices generally have rather hardened owing to the appreciation of a chance of business being lifted from the rut to which unduly light supplies have so long confined it.

Odessa Oak.—This market has been inactive, as all available supplies for some time ahead have been allocated.

"BONNA" ARMoured CONCRETE PIPE, AS MADE BY THE COLUMBIAN FIREPROOFING CO. LTD.

REINFORCED CONCRETE PIPES.

IN connection with the Swansea waterworks extension it has been decided to adopt reinforced concrete pipes for about a mile of high-pressure water main of 18ins. diameter, with a working pressure of 150ft. head. This is interesting as being the first use in this country of such pipes for the conveyance of fluids under pressure. For some time reinforced concrete pipes have been used for sewers, but not for water mains. On the Continent, however, the Bonna system has been largely adopted, and this same system is to be used at Swansea, the contract having been let to the Columbian Fireproofing Co., Ltd., of 37, King William Street, who are the concessionaires of the system for this country. We give an illustration on this page showing one of the pipes. It will be seen that the reinforcement consists of Latin cross bars wound spirally inside and out of a sheet of steel tube, these bars being secured by smaller longitudinal bars of Maltese cross section. Where pipes are not for pressure this steel sheet is not required, serving only to prevent penetration of moisture before the pipe is thoroughly matured and becomes perfectly hard. The concrete is composed of cement and sand mixed to the consistency of grouting, and is poured into the moulds vertically. These moulds consist of an inner core and outside cover. In the case of large contracts the pipes are made on the job, the mixing plant being moved on rails from pipe to pipe.

When a sufficient number have been made along the line of the main, the trench is excavated at the beginning, the pipes laid and jointed, and the ground filled in as in the case of iron or steel pipes. By this means carting and carriage is saved, but in any case the cost of these pipes is less than those of iron or steel. Each pipe is constructed with rabbeted ends and the jointing is effected by grouting with a composition of bitumen run into the rabbeted edges. Reinforced concrete rings which have previously been placed loosely on the pipes are then adjusted all round the joints, pointed at the sides and covered in with cement. Joints thus made have been found to be absolutely perfect and safe for the highest pressures. The remarkable way in which concrete preserves iron from corrosion is well known, but it is surprising with the small thickness of these pipes that when cut after being some years in use the sheet steel and the bars are found to present the bluish

appearance of steel when leaving the rolling mills, although when originally put in they were slightly rusty. This fact is testified by eminent engineers in official positions abroad. "Bonna" pipes were first used by the Municipality of Paris about twelve years ago, since when about 250 miles have been installed both for high-pressure water and sewage. They vary in diameter from 1ft. to 12ft., and as nearly all the water and sewage pipes in Paris are laid in galleries there has been no difficulty in watching and taking careful note of their lasting qualities. By arrangement with the Columbian Fireproofing Co., British engineers visiting Paris may view these galleries, in one of which two high-pressure water mains, each 5ft. diameter, were laid side by side nine or ten years ago, one being of reinforced concrete and the other riveted steel plates. The concrete pipes have remained perfectly dry and sound, the cost of upkeep having been nil, whilst to prevent leakage the steel pipes need to be constantly watched and painted.

Obituary.

Mr. T. E. Knightley, F.R.I.B.A., of London, died recently at Eastbourne, in his eighty-second year. He was formerly district surveyor for Hammersmith. His best-known architectural works are the Queen's Hall, in Langham Place, and the Birkbeck Bank premises on Holborn. Mr. Knightley became a Fellow of the Institute in 1860.

Mr. J. K. Collins died recently, aged 90. He was the architect of several churches, schools and houses, and was elected a Fellow of the Institute in 1860, but resigned some years ago. He was the author of several folios illustrating Gothic ornament and was one of the early members of the Architectural Association, having been honorary secretary in 1850-1.

Mr. Joseph Howe, head of Messrs. Joseph Howe & Co., builders and contractors, of West Hartlepool, died recently after a long illness. Among works recently completed or in course of erection by the firm are the East Sussex County Asylum, at Hellingly, Sussex, £245,000 (architects, Messrs. G. T. Hine & Co.); the New Bridge Street Goods Station at Newcastle-on-Tyne, in ferro-concrete, £80,000 (architect, Mr. William Bell, F.R.I.B.A.); the new County Hall at Northallerton, £25,000 (architect, Mr. Walter H. Brierley); the Empire Palace Theatre at Newcastle, £20,000 (architect, Mr. Frank Matcham); and Bolton Hall, Wensleydale, £15,000 (architect, Mr. C. Hodgson Fowler). The business of the firm will be carried on by the executors with the same staff and under the same style as hitherto.

STABLE AND COWHOUSE FITTINGS.

The Standard for Efficiency and General Excellence.

Carron Stable Fittings are made on strict hygienic principles, from the best materials, well designed and finished. They are employed by the leading Stockbreeders, Nobility and Gentry throughout the Country, amongst whom the following may be mentioned :

Dowager Duchess of Newcastle, Duke of Buccleuch, Marquis of Londonderry, Earl of Yarborough, Earl of Derby, Earl of Sefton, Lord Howard, Lord Adam, Sir Sydney Waterlow, Bart., Sir Donald Currie, Right Hon. J. B. Balfour, General French, Major Cardew, Captain Bissett, J. R. McKillop, Esq., M.P., &c.

TROUGHS, MANGERS, HAY RACKS, BOILERS, STALL AND BOX DIVISIONS AND DOORS, HEEL POSTS, CORN BINS, DRAIN GRATES, AIR GRATINGS, WINDOWS, GRUEL POTS, NAME PLATES, VENTILATORS, STOVES, GUTTERS AND TRAPS, CLINKERS, CATTLE HOUSE AND PIGGERY FITTINGS, AND CAST IRON STABLE AND FARMYARD REQUISITES OF EVERY KIND.

WRITE FOR No. 24 ILLUSTRATED CATALOGUE, "*STABLE FITTINGS*."

Electrical Notes.

School Lighting.

It has already been pointed out in these columns how necessary it is to obtain the best possible system of lighting in schools, by reason of the fact that so much danger to eyesight is caused by insufficient lighting. Of course for the most part of the time when lessons are being conducted the windows admit all the necessary light, but on dark days, especially in winter, the employment of a suitable form of artificial light becomes necessary. In this connection the experiments recently made by Dr. Müller at Bremen, Germany, on the best method of arranging lights for students' desks are interesting. Two series of tests were made, the first with "Tantalum" electric glow lamps, and the second series with arc lamps. The glow lamps were arranged in four groups of six 22-c.p. lamps under a mirror reflector, and their positions were determined by dividing the room, which was about 25ft. by 23ft. by 13ft. high, into four equal rectangles and then suspending the lamps from the centres of each. The lamps had ground-glass globes. Dr. Müller concluded from these experiments that lighting under such conditions, with the lamps about 8ft. above the level of the desks, was sufficient for the size of the room in question, even making allowance for the gradual soiling of the walls and ceiling and the lessening illuminating value of the lamps themselves. The room in which the second series of tests with electric arc lamps was carried out measured 34ft. by 24ft. The lamps were of the Siemens-Schuckert school type, requiring 10.4 amperes and absorbing 1,144 watts, and they reflected the light up on to the ceiling and some little way down the walls. Two lamps were suspended about 8ft. from either end of the

walls. The light values obtained ranged from 4.7 to 2.5 candle feet, as compared with 3.8 to 2.7 of the glow lamps; but it should be borne in mind that the reflected light from the arc lamps was better than the direct light from the glow lamps, being more evenly diffused. The power used in both experiments was about the same. An interesting fact elicited was the difference in illumination when the rooms were empty and when occupied with desks and scholars. With the glow lamps the values were 4.1 candle-feet in the first case and 2.85 in the second case—a loss of about 30 per cent.; while with the arc lamps the values obtained by the tests were 3 and 2 respectively—a loss of about 33 per cent.

Too Many Electricians.

For the past half-century it has been common enough to hear of the overcrowded state of every profession, with, however, the salving statement that there is always room for the best men at the top. In the architectural profession the same story is told, and even the comparatively new profession of electrical engineering is similarly branded. The "Electrical Review" takes up this matter in its issue for September 8th. Our contemporary points out that technical colleges all over the country are turning out embryo electrical engineers by the thousand every year. A large part of the students' time has been given to the study of dynamo design, although the chances are that very few indeed will ever need to remember a single formula they learnt, and fewer still could design a satisfactory dynamo for any given output. It does not seem to be recognized yet that real dynamo designers form a very small proportion of the total number of electrical engineers; and now that sizes of motors and dynamos are fairly standardized the proportion will be smaller still in future.

Again, a technical graduate would, without any hesitation, undertake to design an electrical railway system complete from the power-house to the cars, yet he would fail if told to get out an arrangement for driving a pump or a machine tool by motor. "It is said, and truly said, that you cannot teach a man experience. But it is equally true that an engineer with a long experience in the practice of his profession will prove a more valuable and more helpful teacher to engineering students than one whose experience does not extend beyond the four walls of the college laboratory. This fact is well recognized in America, where professors are chosen for their practical experience as much as for their academic careers. Even, however, if our technical college training were perfect, it appears to be the fact that the supply of electrical engineers has overtaken the demand, and they are now a glut on the market. An advertisement for an experienced man, at a salary far too low for the experience demanded, will call forth replies from scores, even hundreds, of men with excellent credentials, prepared to go to the ends of the earth in order to earn a bare living. It is difficult to suggest a remedy for this state of things. It is not as though electrical engineering were the only overcrowded profession; all branches of engineering are in the same case, as are also the medical and legal professions. The supply of technically-trained men now far exceeds the demand, and the salaries obtainable for responsible positions are very often far less than those of the workmen occupying subordinate positions."

Mr. A. V. Ingall, of 3, Temple Row West, Birmingham, has taken Mr. E. Stanley Mitton into partnership. The business will now be carried on under the title of "Ingall, Son & Mitton."

Advertising Notes.

A standing advertisement, like a standing pool, loses all life, and soon gathers the scum of obscurity. Change your copy frequently.

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two. Advertisements must reach the Office not later than 5 o'clock on Monday.

ARCHITECT and SURVEYOR'S ASSISTANT, with 10½ years' experience in design, details, specification, and quantities for first-class work, just disengaged, desires RE-ENGAGEMENT.—Z. 6, Hope Terrace, Matlock Bath, Derbyshire. 1368

ARCHITECT'S ASSISTANT (A.R.I.B.A.) desires immediate RE-ENGAGEMENT in Provinces. Large varied experience good class Provincial work. Design, details and experienced Quantity Surveyor. Excellent testimonials. Very moderate salary.—"EXPERIENCE," Box 1325, BUILDERS' JOURNAL Office, 6 Great New Street, Fetter Lane, E.C. 1368

ARCHITECT'S ASSISTANT, capable, energetic, eight years' experience, seeks re-engagement. Town or country. Salary £2 2s.—LASCELLES, 5, Dovecote Road, Wandsworth Common. 1302

ARCHITECT'S ASSISTANT (25) disengaged; nine years' experience; good draughtsman, working drawings, details, &c.; London or country.—W. A. N., 46, St. Augustine's Road, Camden Square, N.W. 1372

ARCHITECT'S ASSISTANT (24) disengaged; nine years' experience; good draughtsman, designs, working drawings, details, &c.; London or country.—W. H. L., 83, Elspeth Road, Clapham Common, S.W. 1374

ARCHITECT'S JUNIOR ASSISTANT (21) desires SITUATION, free after 23rd September. Four years' experience. Advanced building construction certificate. Moderate salary.—C. E. H., 263, Broad Street, Birmingham. 1341

ARCHITECTURAL ASSISTANT disengaged. Preliminary sketches, working drawings, specifications, details, surveying, and levelling, and general office routine. Salary £2.—Box 1332, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C. 1342

ARCHITECT'S JUNIOR ASSISTANT desires ENGAGEMENT in a good London office. Five years' experience; age 23. Good references. Salary moderate.—B. E. ATKINSON, Jun., 14, Rosslyn Hill, Hampstead, N.W. 1342

ARCHITECT'S JUNIOR ASSISTANT; six years' experience, five years' articulated; contract drawings, details, surveying and levelling. Excellent references present berth.—Box 1366, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C. 1342

BUILDER'S ASSISTANT requires ENGAGEMENT. Ten years' experience; take charge of office; thoroughly conversant whole routine; take off quantities; draughtsman, adjustment of contracts; excellent references.—B., St. Albans, Winchester Road, Basingstoke. 1329

BRICKLAYER WANTS WORK. Practical in sanitary, fire and general work. Can take charge.—W. VENN, 68, Netherwood Road, West Kensington Park. 1331

BUILDER'S CLERK.—Book-keeping, assisting Quantity Surveyor; abstracts, time-sheets, general routine; typewriter; excellent references.—P. H. G., 2, "Fernhelo," Bonner Hill Road, Kingston-on-Thames. 1352

BUILDER'S CLERK, experienced, double entry book-keeping, time sheets, correspondence and general routine. Plans &c. Town or country. Moderate salary.—E. W. H., 11, Archibald Road, Tufnell Park, N. 1348

CARPENTER, JOINER, STAIRHAND; piece or day, or as Working Foreman.—J. E. PLASTERER, clean workman; piece or day; abstainers; town or country.—A. E., 84, Cambourne Road, Southfield, Wandsworth. 1320

CLERK of WORKS or GENERAL FOREMAN disengaged; practical and reliable; experienced in all classes of public and private works; good references; town or country.—C. W., 53, Portland Road, Notting Hill. 1304

ESTATE OFFICES, ARCHITECTS, SURVEYORS.—Young Gentleman well up in Planning, Surveying, Levelling, Quantities, and Specifications, desires permanency. Experienced in General Management and Estate Development. A.I.S.E. and A.R.S.I.—Box 1311, BUILDERS' JOURNAL Office, Gt. New St., E.C. 1311

FOREMAN of JOINERS seeks situation with a firm which turns out first-class work. Accurate setter out. Good references.—Chaseley Villa, Langton Road, E. Molesey. 1313

GENERAL or WORKING FOREMAN (Carpenter) seeks SITUATION. References. Age 29. Gold and silver medals Carpenters' Comp., first-class certificate and bronze medal Carpenters' Comp. Exam.—W. S., 43, Skinner Street, Clerkenwell. 1305

Privileges open to all Regular Readers of the "Builders' Journal."

I.—Free Monthly Advertisements.

1. A Free Advertisement of 12 words in the Wanted or Miscellaneous Advertisement Columns, in one issue of the BUILDERS' JOURNAL during each calendar month will be given to any regular reader.

2. The charge of one penny will be made for each additional word.

3. Advertiser's Name and Address or Box Number must be counted, but will in no case be reckoned as more than five words.

4. All advertisements must be accompanied by the correct remittance, and should a receipt be required a stamped addressed envelope must be enclosed.

5. The Proprietors reserve to themselves the right of refusing any advertisement.

II.—Free Answers to Enquiries.

1. The services of a large staff of experts are at the disposal of all regular readers who require information on architectural, constructional or legal matters.

2. Questions should in all cases be addressed to the Editor, and be written on one side of the paper only.

3. Correspondents are particularly requested to be as brief as possible.

4. The querist's name and address must always be given, not necessarily for publication.

Note.—Owing to the large number of enquiries we receive weekly, we are compelled to restrict the advantages of this department to Regular Readers.

III.—Free Accident Insurance of £500.

1. Every regular reader of the BUILDERS' JOURNAL is entitled to the benefit of this Insurance.

2. A Pamphlet giving full details of this and other Insurance schemes inaugurated by the BUILDERS' JOURNAL for the benefit of its readers, and guaranteed by "The Ocean Accident Corporation, Limited," will be sent on application.

What is a Regular Reader?

We have employed the term "Regular Reader" throughout these announcements as the description "subscriber" is often understood to mean one who subscribes direct to the publishing office.

We mean by a Regular Reader anyone who has placed an order with us or any newsagent or bookstall for the BUILDERS' JOURNAL for one year.

Those readers who order the BUILDERS' JOURNAL through their local newsagent or bookstall should send us the newsagent's receipt. Their names will then be placed on our subscribers' list, and they will be entitled to all the advantages set out above.

5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS.

OFFICE: 6, GREAT NEW STREET, FETTER LANE E.C.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, Great New Street, Fetter Lane, E.C. Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

THE BUILDERS' JOURNAL SUPPLY DEPARTMENT,
6, Great New Street, Fetter Lane, E.C.

THE BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

September 20, 1905. Vol. 22, No. 554.

6, Great New Street, Fetter Lane, E.C.

Summary.

In their report on the cheap cottages exhibition at Letchworth the judges point out that the site was exceptionally suited to economical building; the cheapness of bricks and cement here made it possible to erect substantial cottages at a price which compares favourably with that of either timber-built cottages of the same accommodation or of houses constructed of the various patent materials. They express the opinion that many of the competitors do not appear to have realized the problem before them, and that a number of the cottages are not suitable for agricultural labourers. (Page 170.)

The new chapel now being built for the U.S. Naval Academy at Annapolis furnishes a notable example of reinforced concrete work. The structure is circular, flanked by four wings and surmounted by a dome and cupola. The main problem in the design was due to the fact that the dome, being of smaller diameter (69ft.) than the circular main structure (83ft. 4ins.), had to be carried in cantilever over its supports. This eccentricity required the corbelling inwards of the whole structure supporting the dome, so that a cantilever construction was demanded in the main piers, the circular girder and the dome columns. The lantern which crowns the dome is of terra-cotta and weighs 120 tons. (Page 160.)

A great deposit of a remarkably fine creamy marble has been discovered in Sutherlandshire. (Page 165.)

Watts's equestrian figure of "Physical Energy" is being prepared for shipment to South Africa, where it will be erected at Groot Schuur. (This page.)

The Associated Portland Cement Manufacturers (1900), Ltd., declare a dividend on their preference shares at the rate of $5\frac{1}{2}$ per cent. per annum, but no dividend yet on the ordinary shares. (Page 165.)

The whole of the west end of St. Mark's is now covered by scaffolding, and it is calculated that eighteen months must elapse before this portion of the church is put in a proper state of repair. The present cracks are not thought to have been caused by the fall of the campanile, as there have been in operation for centuries certain influences which have slowly but surely weakened the structure—water under the foundations, salt air, and excessive weight imposed by mosaic and marble work. (Page 166.)

A new process of metal inlay has been introduced. It consists in alloying one metal with another—zinc on copper, for instance—and is adaptable to many decorative treatments. Its use on radiators and pipes is suggested. (Page 166.)

Anchors. It is remarkable that the provision of anchors in modern buildings has practically gone out of use. In many old buildings in this country they are to be found both used constructionally and forming pleasant decorative features. The form in which they are made so as to record the date of erection is well known. To this day in Belgium and the Netherlands anchors are very much used, though not always visible and decorative, being often concealed in the wall. They offer distinct constructive advantages in tying together walls and other parts of construction, and it would be better if architects provided them at the time of erection than that they should have to be inserted afterwards when the walls show signs of weakness. Floor joists often pull away from the walls, and in certain parts of the country the craftsmen still retain the traditional rule that joists should be tied into the wall with an iron anchor, however small the building. Of course in small house work it is not necessary, but where the spans are large or the height of a building is considerable anchors should not be slighted. They provide additional strength and save their cost over and over again. There are several varieties of anchors used in construction, namely, the ashlar anchor, for securing parts of ashlar facing to the backing, the usual form being that of a cramp; the spur anchor, for securing floor beams to masonry or brickwork; the star anchor, used as a tie-rod, this being secured to other portions of the building; and the wall anchor, used for tying parts of masonry or brickwork together, generally at the junction of two walls, and thus affording a means of bonding.

A Magnificent Piece of Sculpture.

It has been remarked more than once that the late G. F. Watts, had he devoted himself to sculpture instead of to painting, would have achieved even greater success with the chisel than with the brush; and certainly the few sculptures which he produced give every support to that belief. His most important and greatest work is the magnificent equestrian figure of "Physical Energy," which was erected in the quadrangle of Burlington House in connection with the Royal Academy Exhibition last year. This has just been taken down, and is now being prepared for shipment to South Africa. According to present arrangements it will be erected not on the Matoppos as once pro-

posed but at Groot Schuur, the Cape Town residence of the late Mr. Cecil Rhodes, to whose memory Mr. Watts, at the request of Earl Grey, consented that the statuary should be dedicated. It is understood that the original model has been offered to the British Government, and that places will be found in this country and in India for replicas of the noble work. It is quite a masterpiece of sculpture and is worthy to be seen side by side with the greatest Greek pieces, embodying as it does a splendid feeling for sculptural treatment.

Our Insurance: £750 to a Builder.

IN connection with our schemes of insurance we have just paid £750 to a builder for an injury to his left arm which necessitated amputation. This fact should be borne in mind by those who have not yet availed themselves of the advantages of our insurance. There is no need to worry about the chances of one's getting killed in a railway train or at the corner of the street or in any of the hundred other places where one might get killed nowadays in a world of hurry and speed; worrying about these things leads eventually to neurasthenia and the lunatic asylum; neither is it of any use to go about wrapped in antiseptic clothing, breathing through a nose-filter and eating chemically-treated beans and lentils in order to avoid contagion by disease germs all around us; nevertheless the numerous accidents which are reported in the newspapers are a continual reminder of the risks we all undergo, while at times of epidemic especially the chances of contagion are brought forcibly to our minds. Accidents on buildings are always happening, and all architects, builders and others concerned should not fail to insure themselves against these. We have hundreds of names on our books, but in the interests of readers we desire to see still more. Many claims have been paid at one time and another. The largest is that mentioned above, but others have been £10 10s. to a builder who was kicked by a horse, £6 to an architect who slipped down some steps, £6 to a builder who injured his face, eye and foot, and £4 10s. to an architect who trod on a rusty nail which entered his foot. These are not very large amounts, but they are ample compensation for the injuries. All readers are entitled to the benefit of our insurance schemes, of which there are three, and a pamphlet giving full particulars of each can be had on application.

A REINFORCED CONCRETE CHAPEL.

A NOTABLE example of the use of reinforced concrete is furnished by the new chapel now being built for the U.S. Naval Academy at Annapolis. We give herewith several detail drawings of the construction, taken from our American contemporary the "Engineering News." As will be seen, the chapel is a circular structure flanked by four wings and surmounted by a lofty dome and cupola. The dome shells, the arched roofs of the wings, the supporting piers and columns, the interior bracing and the floors, and their supports, are all reinforced concrete. This concrete skeleton is, however, completely concealed by a covering of granite, white brick and terra-cotta on the outside, and on the inside by the interior finish and decoration. The present description covers the reinforced concrete work.

The main supports of the building are eight piers arranged in pairs, 90 degs. apart, around the periphery of a circle 83ft. 4ins. in diameter. These columns are vertical to a height of 35ft.; then they corbel radially inwards until the distance between inside faces of diametrically opposite columns is reduced from 83ft. 4ins. to 72ft. 10ins. The corbelled tops of the columns are surmounted and connected by a circular girder, which is a ring cut from a hollow cone and has an inside diameter at the bottom of 72ft. 10ins. and at the top of 69ft. 8ins. On the top of this circular girder are spaced 24 columns, which corbel inwards like the main piers and carry a second circular girder similar to the first. This last girder carries the shells forming the main dome and the ceiling dome. The lantern is carried by a pyramidal framework, whose spreading legs set into the main dome shell near its bottom. There is also a system of struts between the piers, as indicated in Fig. 1.

The four wings of the building form transepts to the main auditorium, and each is roofed by a segmental arch, supported at its four corners by the main piers and by two separate columns. As these roof arches carry no load except their roof covering, the thrust on the columns is readily taken up by a tie across the front of the arch. Fig. 1 shows this arrangement clearly. The remaining structural framework of the building, all of which is of reinforced concrete, comprises the main and gallery floors, and is indicated by the drawing.

It will readily be seen from the preceding general description that the main problem in the design was due to the fact that the dome, being of smaller diameter than the circular main structure, had to be carried in cantilever over its supports. As stated above, the piers are rectangular and vertical to a height of 55ft. above the footings and then corbel radially inwards toward the centre of the building. The eccentricity of the loading, due to the corbelling, made it necessary to reinforce the outer face of the column to take tension and the inner face to take compression. The compression bars had butt joints enclosed in steel sleeves. All the vertical bars were tied together at intervals by horizontal peripheral hoops of $\frac{1}{4}$ in. rods. The piers are on concrete footings 13ft. 6ins. by 16ft. 6ins. on plan, which bring a load of about 4 tons per sq. ft. on the soil.

The architect's plan required the dome to be carried on twenty-four columns. To connect these columns with the supporting piers the tops of the latter were bridged by a circular girder, on which the dome columns took footing. A half plan and diametrical vertical section of this girder are shown in Fig. 2. Fig. 3 shows radial sections of the girder at two points. It will be noticed that the girder is corbelled inwards and carries a gallery in cantilever. These eight points of support alone, however, left a considerable span of girder unsupported, as shown by the

FIG. 1.—PLAN AND SECTIONS OF CHAPEL FOR THE U.S. NAVAL ACADEMY AT ANNAPOLIS.

FIG. 2.

plan, Fig. 2, and braces were therefore introduced, reaching diagonally from the piers to the girder. The thrust of these brackets against the piers was transmitted to the companion piers of each pair by a horizontal strut, and it is important to note the interlocking of the strut and brace reinforcement and the bonding of the brace reinforcement into the girder.

The twenty-four columns supporting the dome take footing at equidistant intervals around the circular girder, and are bonded into this girder by their reinforcement, as shown in Fig. 3. These columns are corbelled inwards like the main piers and carry a circular ring, on which the shells of the dome rest. The columns are bonded into the dome ring in much the same way as the main piers are bonded into the large circular girder.

The dome proper of the building, as shown in Fig. 1, consists of two shells, both of which are carried by the circular ring. Figs. 4 and 5 show the details of the shell construction. It is to be noted first that the inner and outer shells are braced together by a system of radial struts, and that the outer shell is stiffened by a pyramidal framework which takes the weight of the lantern off the crown portion of the shell and carries it to points low down on the haunches. The detailing of this framework and of the various parts of the shells is clearly shown by the diagram and need not be elaborated here. It is important to note the boldness of the design providing for a dome shell of 69ft. interval diameter and only 8ins. thick at the thickest part.

The lantern which crowns the dome is of terra-cotta and weighs 120 tons. It is anchored to the outer dome shell to resist wind strains, but its weight is relieved from the shell by the pyramidal framework previously mentioned. It was impracticable to make the shell strong enough to carry the cupola because of the series of skylight openings at the crown.

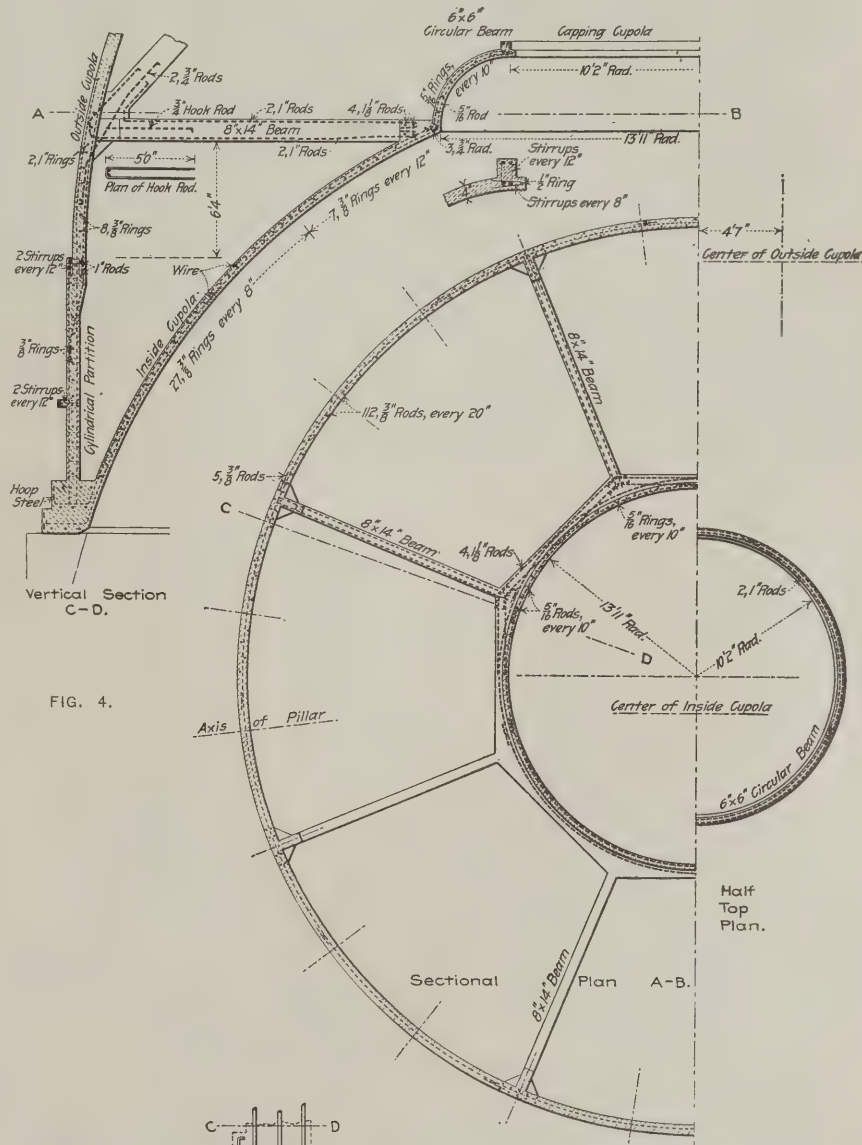

The only parts of the wings that call for attention are the roof arches and their supports. The arches are semicircular segments, with a clear span of 42ft. roins., a crown thickness of 8ins. and a thickness at skew-backs of 14ins. This circular shell connects into the main piers at its inner end and is carried on two columns at its outer end. To prevent these isolated columns from spreading under the arch thrust a tie is carried across the arch at this point. The columns are rectangular, with a vertical bar at each corner and hoops connecting these bars at smaller intervals vertically.

The main floor of the chapel is composed of thin flat top concrete arches carried by the main piers, a circular row of concrete posts and a circular concrete wall. This construction is clearly indicated by Fig. 1, which also shows the gallery floors and those of the altar and organ-loft. The stairways from the crypt to the main floor and from this floor to the galleries and lofts are all straight run stairs of reinforced concrete. A spiral stairway around one of the columns carrying the arch roof of the north wing, and enclosed in the curtain walls (as shown by the plan, Fig. 1), gives access to the roof. This stairway is also of reinforced concrete.

To ensure clearness, the preceding description has been held closely to a bare statement of the structural parts of the chapel as shown by the drawings, and needs to be supplemented by further explanation of the conditions influencing the design, and other general aspects of the work. It is important to explain first that the original plans of the architect called for a solid concrete construction for the walls, and this concrete was to be faced with brick, granite, terra-cotta, &c. Tenders were asked on these plans, and when received were found to exceed the amount appropriated for the

chapel building. Contractors were then asked to propose designs of their own, on the condition that the architectural lines of the building be respected. The Noel Construction Co., of Baltimore, proposed a design made by the Baltimore Ferro-concrete Co., and were awarded the contract. Compared with the original design for solid concrete walls, dome and roof arches, the new design first decreases the load by substituting reinforced concrete for the dome shells and roof arches, and then carries this load to the foundations by piers instead of by the building walls. This made it possible to enclose the building with hollow walls and thus materially cheapen the construction.

The substitution of the new design involved several structural difficulties. As has been noted in the preceding description, the diameter of the dome is 69ft., while the piers which support it are set with their inner faces on the circumference of a circle 83ft. 4ins. in diameter. The eccentricity of the dome shell with respect to its main supports is thus 7ft. 2ins., and this eccentricity had to be provided for by corbelling inwards the whole structure supporting the dome, so that a cantilever construction was demanded in the main piers, the circular girder and the dome columns. This explains the complexity of the reinforcement and the intimate bonding of the several connections. In this

COTTAGE AT SUNNINGDALE, BERKS. CHAMBERS AND MARTIN, ARCHITECTS.

This house is nearing completion for Mr. E. Tindal Atkinson, and is one of a number in course of erection from the designs of Messrs. Chambers & Martin, architects, of London. It is built of red bricks up to the first floor, the upper part being rough-cast, finished white. The hall is of unusual size for so small a house, but it is intended as a sitting hall. The cost is about £1,600. Messrs. Frank Harris & Co., of Barnsbury, are the builders. The situation is excellent, facing golf links back and front.

by Mr. Twelvetrees before the Civil and Mechanical Engineers' Society, which has been reprinted in pamphlet form. This deals with the design of reinforced concrete beams, and consists of a summary of what is set out in greater detail on this particular branch of the subject in the author's book.

"Concrete Steel," by W. N. Twelvetrees. London and New York: Whittaker & Co., price 6s. nett.
"The Design of Concrete-Steel Beams," published by the Civil and Mechanical Engineers' Society.

Italian Architecture.

This interesting and instructive essay by the Rev. J. Wood Brown will well repay perusal. It gathers into a small compass a general purview of a very wide field of architecture, embracing the earliest examples of Rome to the later Renaissance. This concentration, which of course has its disadvantages, contrasts the different styles on the one hand and shows their evolution and relation on the other hand. Mr. Brown first takes the subject of concrete architecture as typical of the Romans, but fails to give due consideration to the constructive ability displayed. He talks as though wood centering were the only thing used, and seems to miss the real function of the tile facing and arched ribs—so masterfully enunciated by Choisy. However, the author recognizes that architecture is building art, and that all consideration of styles must primarily depend upon due appreciation of the advance of constructive knowledge of the builders, and his comparative criticism and explanation of Basilican, Byzantine, Lombard Romanesque, Gothic Romanesque and Renaissance architecture is highly interesting.

"Italian Architecture: Being a Brief Account of its Principles and Progress," by J. Wood Brown, M.A. London: A. Siegle, 2, Langham Place, W., price 1s. 6d. nett.

Law Cases.

Insufficient Hoarding around Buildings.—Mr. F. C. Hornbuckle, builder, was summoned at the Sheffield City Police Court last week for not having erected close boarded hoardings around some houses he was building in Ellesmere Road and Scott

Road. The houses had a frontage of 80ft. No fencing at all was put up when building was commenced, but eventually some was erected in front. As the houses were in a hollow this was necessary; 15ft. of the frontage, however, was left unfenced, and this constituted the offence stated in the summons. Defendant pointed out that this space was for the purpose of allowing building material to be brought in. Upon promising to attend to this unfenced portion, he was fined 5s. and costs.

Correspondence.

Architectural Refinements in Mediaeval Buildings.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I have read with interest the article on architectural refinements in mediaeval buildings published in your issue for last week. Some years ago, before the Goodyear Exhibition was heard of, and being quite unprepared to meet with optical refinements in Gothic work, I happened to be studying fifteenth-century architecture in Wells. Standing at the lower entrance near the chapter-house, the view looking up the vicars' close greatly impressed me. The close contains forty-two vicars' dwellings, arranged upon opposite sides of an apparently straight and parallel carriageway. Each dwelling consists of two rooms, a small yard behind, and a garden in front surrounded by a dwarf stone wall. The buildings are of rubble with cut-stone dressings, in two storeys, and their ornate chimneys form a prominent feature in the perspective. On referring to a plan of the close published in Pugin's "Examples of Gothic," vol. iii., I found that although the close is ostensibly parallel the width at the lower end is 65ft. between building lines, while that at the upper end is only 56ft., giving lines which are out of parallel to the extent of 9ft. in a length of 436ft., or nearly 1 in 49, a fraction quite imperceptible to the eye of a casual observer. In addition to the convergence of the main building lines, there is also a con-

vergence of the dwarf walls bounding the front gardens to the extent of 7ft. in the same length of 436ft., thus assisting in the illusory effect. There is no doubt that these converging lines add considerably to the picturesque effect of the close, and it seems to me that there is no doubt that the buildings were laid out in this way intentionally, since in other respects the lines are straight and the angles square, there having been apparently no restrictions on the original site.

Not hitherto having seen attention called to this instance of architectural refinement in planning, it struck me that some readers might be glad to have their attention called to this case. It also points to the possibility that if other mediaeval buildings are carefully examined the secret of their beauty may be found to lie partly in similar devices.
—Yours truly, HAROLD BUSBRIDGE.

PLUMSTEAD.

[The Goodyear Exhibition at Edinburgh will remain open till the end of October.]

Competitions.

Rochester Technical Institute.—Mr. Baggallay has made the following awards in the competition for a new technical institute at Rochester. First premium, No. 72, Messrs. Russell & Cooper, London; second premium, No. 74, Messrs. Crouch, Butler & Savage, Birmingham; third premium, No. 45, Mr. W. H. Knowles, F.R.I.B.A., Newcastle-on-Tyne. The designs were on exhibition at the Corn Exchange, Rochester, last week.

New Chapel and School at Bradford.—The competition for a new chapel and school at the corner of Shearbridge Road and Woodhead Road, Bradford, to replace Mannville Chapel and School, has been decided in favour of Mr. E. H. Parkinson, who, out of the four Bradford architects invited by the trustees to submit designs, was awarded the first premium of £10 10s. Mr. W. E. Potts, A.R.I.B.A., of Messrs. Potts, Son & Hennings, of Manchester and Bolton, was the assessor.

CONSERVATIVE CLUB, LEWISHAM.

HOUSE AT RYE, SUSSEX.

HOUSE ON THE GREEN, RICHMOND, SURREY.

HOUSE AT RYE, SUSSEX.

SOME EIGHTEENTH-CENTURY DOOR-HEADS.

Whatever may be the individual opinion of eighteenth-century architecture, we have at least to be thankful to it for handing down a number of most delightful door treatments, of which the four examples on this page are thoroughly representative. The Doric door head on the Conservative Club at Lewisham, with its pilasters, is excellently proportioned and dignified; that at Richmond is one of many to be seen there—relics of a day when there was no such thing as a District Railway; while the two examples from Rye serve to accentuate the difference between the ordinary designs of then and now. The ironwork shown is also worth attention. It is to be regretted that much of this old woodwork is often thickly coated with paint which clogs up all the fine carving.

Builders' Notes.

"Victor" Spring Hinges, the patent of Mr. Robert Adams, of 3 and 5, Emerald Street, Theobald's Road, W.C., have been selected in competition for use throughout the new War Office in Whitehall.

Swedish Granite is largely imported into Aberdeen. While Aberdeen granite is the best for durability, it has not the variety of texture and grain found in the Swedish quarries. Architects are specifying very freely for Swedish granite.

Superannuations for Carpenters and Joiners.

—The members of the Amalgamated Society of Carpenters and Joiners are said to be in a state bordering on panic through fear that the superannuation provisions are altogether inadequate.

The Building Trade continues depressed and competition to secure the few contracts going is very keen. The brick trade is deplorably demoralized, and it appears impossible to move off the heavy stocks covering the yards at the chief centres of manufacture throughout the country.

New Barracks for York.—At a meeting of the Streets and Buildings Committee of the York City Council last week a letter was read from the War Office authorities asking whether the council could place at their disposal a site of about fifty or sixty acres on which barracks might be built.

Discovery of Marble in Sutherlandshire.

—On the Sutherlandshire portion of the estate of Sir Charles Ross, Bart., of Balnagowan, a great deposit of a remarkably fine marble has been found. Samples have been submitted to leading marble merchants, who pronounce it to be excellent, while Mr. Brock, R.A., and other sculptors unanimously concur in stating that it is a marble of remarkable purity and very fine texture. It is of a creamy colour.

The Derwent Valley Water Board is spending something like £6,000,000 on behalf of Sheffield, Leicester, Derby, Nottingham and the counties of Derby and Notts, but the public are given little opportunity of knowing what it is doing or how it is doing it. The Board is practically a close corporation. Now and then, through the advertisement columns, it is possible to see that the Board is in search of tenders. But contractors in the towns immediately concerned receive small consideration.

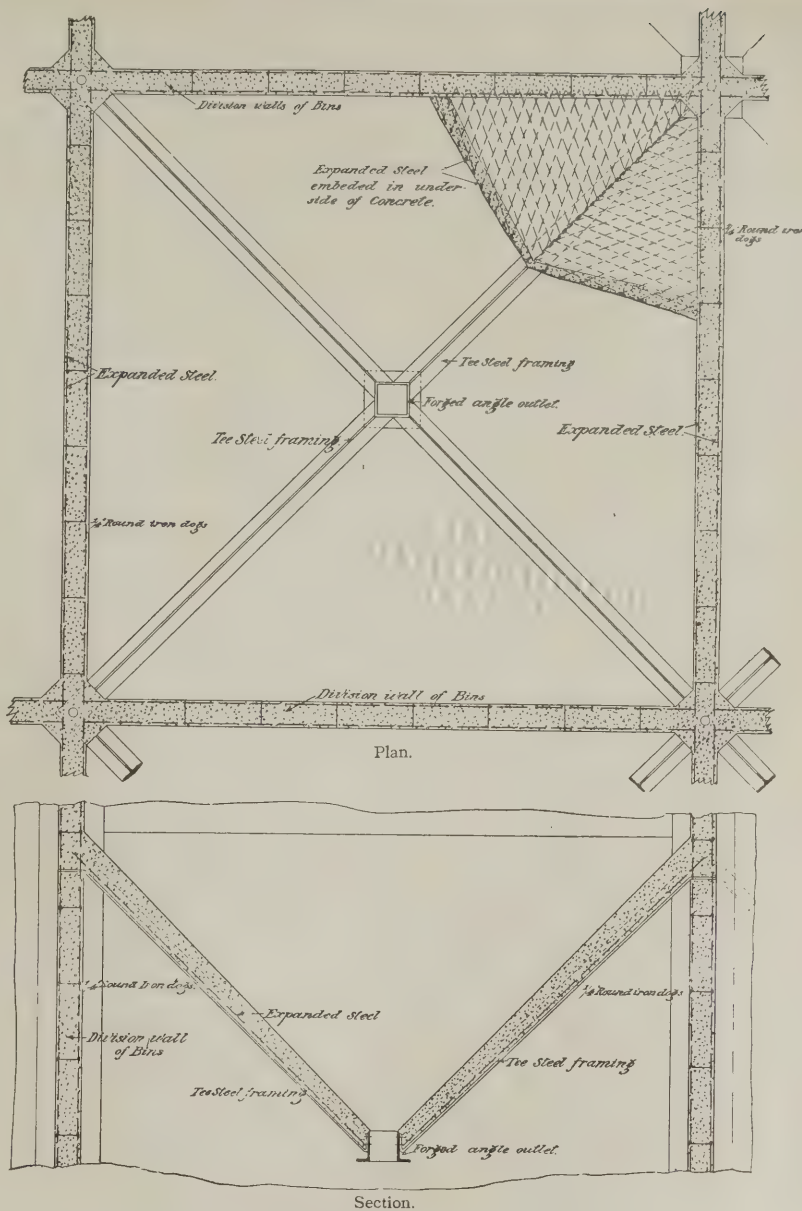

Sunderland Building Trade Dispute.

—A conference between the builders and plasterers at Sunderland took place in the town hall last week, on the invitation of the mayor (Councillor F. Foster), to see if some settlement of the dispute between them could not be arrived at. There was an agreement on all points of the rules excepting on the question of lathing, which the masters declared was a special class of work. The conference was brought to a close without considering the wage question, and was adjourned *sine die*.

Bath Stone Facing: An Old Patent.

From the "Times" of July 4th, 1816:—Sir,—For the information of those who may be interested in architectural improvements, I wish to communicate through your paper, that by license from the patentee, I undertake to case buildings with Bath stone at less than half the expense of common ashlar, and in such a manner as to render the walls perfectly waterproof; and also that I prepare a new species of inlaid pavement for floors, far surpassing in beauty and variety of design, the ancient works of that nature. — J. C. CARTER, 1, Dean Street, Soho.

Associated Portland Cement Manufacturers (1900), Ltd.—The report of the directors and statement of accounts to June 30th, to be presented at the sixth ordinary general meeting of the company to-day, give a

A HOPPER BOTTOM FOR SILOS.

The above illustration shows a method of forming hopper bottoms to silos, &c., which has been adopted in various places. The descriptive notes on the drawing are self-explanatory. Expanded metal is laid in the walls with the longway of its mesh horizontal, and is distanced by means of round iron-dogs and kept about $\frac{1}{4}$ in. from each face of the wall. An enormous block of silos on this system was constructed at Madero Dock, Buenos Ayres, to the designs of Messrs. Sir Douglas Fox and Partners and Messrs. Livesey, Son, & Henderson.

profit of £333,194 for the year's working and recommend the payment of a final dividend on the preference shares at the rate of $5\frac{1}{2}$ per cent. per annum. "The report and balance-sheet," says the "Financial News," "may truly be said to be the record of an undertaking struggling for existence against heavy odds. . . . Over-capitalized from the commencement, the company has since been compelled to resort to raising still further moneys, and thus its financial prospects have been handicapped additionally in the interests of its commercial requirements. At the present time the paid-up capital of the concern amounts to no less than £6,539,104. . . . Under such onerous conditions it is needless to say that up to now there has not been any dividend payment in respect of the ordinary shares."

Proposed Garden City Suburb for Bradford.—A Bradford building scheme which may prove of much interest was foreshadowed at a meeting of a sub-committee of the Bradford Buildings Committee last week. It was stated to the committee that a Bradford gentleman had under consideration a scheme for the building of a series of small semi-detached houses on the principles

already carried out in the various "garden cities" in the country. It was proposed that a plot of land of 14 acres in the highest part of Allerton, and in close proximity to the tramway, should be devoted to the purpose, and it was suggested that only twelve houses should be erected to the acre, so that fair-sized gardens could be provided. Each house was calculated to cost from £150 to £180, independent of the value of the site and of the cost of making roads. The matter came before the committee on a question relating to the roads. The building by-laws require the provision of a roadway at least 14 yds. wide between house and house or, if the houses are set back from the road, between garden and garden. The committee were invited to say whether it would be considered within the terms of the by-law if—in order to give a more rural appearance to the colony—the 14 yds. of the roadway were divided so that a road 7 yds. wide should be provided with a grass plot on either side, 3ft. 6ins. wide, planted with trees, and that outside these plantations foot paths each 6ft. wide should be made. The matter will be fully considered at a future meeting.

CONDITION OF THE ALHAMBRA.

THOUGH the alarming report that the Alhambra is threatened with destruction may prove to be exaggerated, no recent visitor to Granada can have failed to notice the neglected appearance of the celebrated Hall of Ambassadors and the still more famous Court of Lions, unique of its kind. The Alhambra has had rather more than its fair share of mishaps since Boabdil surrendered it to the Spaniards in the same year that Columbus discovered the New World. A great part of the Alcazar was burned down in 1524, and what the flames spared was wantonly swept away to provide a site for Charles V.'s displeasing palace. In 1590 the explosion of a powder magazine, which ruined the Cuarto Dorado and several rooms lying off the Court of Lions, provided the novelist and poet Vicente Espinel with a subject for an ode—a poor compensation. Much damage was done in 1883 while an electrical apparatus was being fitted up, and in 1890 a serious fire which might easily have destroyed the whole building was luckily discovered and extinguished in the nick of time. The immediate danger at the present time is said to be due chiefly to an unusual succession of the slight earthquake shocks which are not uncommon in the neighbourhood of Grenada, and if this be so it should not be beyond the skill of experts to avert it. Some necessary underpinning and much more stringent precautions against the risk of fire are desirable and even urgent, but the less tampering with the details of the Alhambra the better.—(From the "Manchester Guardian.")

"SHERARDIZING."

A new Process of Metal Inlay.

WORKS have just been completed for a new process of dry galvanizing called "Sherardizing," the invention of Mr. Sherard Cowper-Coles, of Grosvenor Mansions, Victoria Street, Westminster. By the ordinary process of hot galvanizing it is necessary to first clean the iron from grease, &c., either by "pickling" in acid or sand-blasting, and then to dip it into the molten zinc. In "Sherardizing" it is not essential to clean the metal in this way, though of course all scale needs to be removed; but the great feature of the process is that zinc dust instead of molten zinc is used, and at a much lower temperature, the articles to be galvanized being enclosed for a few hours in a cylinder charged with the dust, which is heated to about 500 degs. Fahr.

This matter is of interest to builders and contractors, but architects will be more concerned with the fact that other metals besides iron can be "Sherardized"—aluminium and copper, for instance—and thus a new method of decoration—a metal inlay—is available. By this process inlaid metalwork can be made similar in effect to the finest Damascening, or, on the other hand, the process readily lends itself to bold work, such as panels, as, by a variation of temperature, one metal is inlaid into another and at the same time one metal can be considerably raised above another at the will of the operator. Various effects are obtained with steel plates inlaid with zinc, the steel being blued to render it rustless. As another example of the effects obtained by this process, a copper tray can be taken and inlaid with zinc, matters having been so arranged that a considerable portion of the copper is converted into a gold-coloured brass, thus giving a very soft effect with great subtlety of colour; or silvery zinc may be obtained on a plain background, and by altering the preliminary treatment and varying the length of stoving it is possible to act upon the base

metal so as to obtain instead of the copper very beautiful effects ranging from silver-white zinc through yellow brasses and bronzes of various shades graduating to the red copper. One of the many applications of this process might be the decoration of radiators, pipes, &c.

THE STATE OF ST. MARK'S.

ANYONE visiting Venice at the present time and seeing church after church invested with scaffolding might be tempted to form very pessimistic views about the stability of the City of the Lagoons, says the correspondent of the "Morning Post."

The whole of the west end of St. Mark's is now covered by scaffolding, which goes to within 6ft. of the roof and has cost £1,500. The cracks in the mosaic are very noticeable when one ascends by a series of ladders to the highest platform of this scaffolding, and it is calculated that eighteen months must elapse before that portion of the church has been put into a proper state of repair. The work is naturally of a very delicate character, and the men employed must be skilled and well paid. Fortunately, like the workmen engaged in the excavation of the Roman Forum, they are keenly interested in their work.

The rise of certain parts of the floor, which led to a person breaking his leg over a projecting fragment of the paving some months ago, has necessitated relaying in a few places. This has, however, been done with the utmost care. To level the floor would be an impossibility architecturally, besides being a gross act of vandalism.

Cracks not due to the Fall of the Campanile.

It is not considered that the present cracks in St. Mark's are due to the effects of the fall of the Campanile. There have been in operation for centuries certain causes which have slowly but surely weakened the structure. Only 5ft. below the floor there is water, which has had a bad influence on the foundations. Worse still, the salt air of Venice, especially during the winter, when cold mists are prevalent, has a destructive effect on all ironwork. The Venetian Republic would not, it is true, allow any iron bars to be placed as supports in a visible position in St. Mark's; but along the galleries are numbers of iron fastenings, put there by Sansovino, when he executed repairs at the church. A further cause of the cracks is the vast weight of the materials super-added to the original structure when the church was richly decorated and altered, without any increase in the strength of the foundations.

The question of expense is not serious. During the Austrian occupation St. Mark's enjoyed an annual donation of £2,400, and this liability was taken over by the Italian Government in 1866 and continued since then. As the work of repairs must of necessity proceed slowly, and long preliminary studies were required, so far the cost has been relatively small. Unforeseen cracks may, of course, render the task of repairing the building more arduous, for Venetian edifices are full of surprises; but persons in a position to judge do not share the view expressed in some quarters that St. Mark's is doomed.

Other Crutches and Splints.

Extensive works are also going on at the Church of San Giovanni e

Paolo; the side of the Doge's Palace adjoining the Bridge of Sighs is shored up by means of huge planks and beams; the campanili of both Sta. Maria Formosa and San Giorgio Maggiore are enveloped in scaffolding; and that of Burano is still rent and unrepaired. In short, Venice is in the hands of the workmen, and some years must elapse before she emerges from her crutches and splints.

BARRACK BLOCKS AND STABLES.

The Large Camp at Bordon.

BORDON CAMP, in Woolmer Forest, has just been completed. It covers an area roughly estimated at a couple of square miles. The main buildings consist of six large brick-built barrack blocks, with accommodation for nearly 1,000 men. These blocks are connected by covered asphalted ways, and there are spacious dining-halls, cook-houses, washing-places, baths, stores, &c. The eighteen troop stables will accommodate about 530 horses, and harness-rooms are attached. There are two blocks of gun and wagon sheds, each block being 40ft. wide and 350ft. long. The many other buildings, all built in brickwork, comprise forage-barns, corn stores, mobilization equipment stores, shoeing sheds, battery offices and stores, meat stores, brigade division shops, coalyards, &c. A spacious riding-school and gymnasium has been provided, also schools for adults and infants, together with mess-rooms, canteens and laundries. Quarters have also been constructed for 103 soldiers' wives and families. The officers' quarters are detached. The officers' mess-room has a frontage of 200ft. The warrant officers and quartermaster have separate quarters. A fire station occupies a central position on the Farnham and Petersfield main road, which runs through the camp. Messrs. T. J. Hawkins & Co., of Ashford, were the contractors for this extensive collection of military buildings.

NEW PREMISES IN PORTUGAL STREET, LINCOLN'S INN FIELDS, LONDON, W.C. HORACE FIELD, ARCHITECT.

These new premises are occupied by Messrs. George Bell & Sons, publishers, and "The Church Times." The building is faced externally with dark red bricks, with dressings of a lighter colour. The stone is Portland. The cornice is of cement cast *in situ*, the enrichment having been carved before the cement had set. The builders were Messrs. Chinchin & Co., of London.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Royal Sanitary Institute Examinations.

X. writes: "Have you, or are there, published any of the questions and answers set by the Royal Sanitary Institute for their examination in 'Sanitary Science'?"

You can get what you want from the Sanitary Publishing Co., 5 Fetter Lane, E.C.

Damp Walls.

ROCHDALE.—F. O. writes: "Which is the best way to treat the gable wall of a house (gins. solid) for dampness, which rises to a height of about 7ft. above ground-level and takes the plaster off the wall inside? It has brick footings, but no damp-course."

Insert a sheet damp-course in short lengths by removing one or two bricks at a time.

Architects' Fees.

BATLEY.—W. R. S. writes: "Is a person connected with some trade who has not been articulated and trained in a proper manner as an architect entitled to claim fees in a court of law for work of an architectural nature, such as the preparation of plans for a building?"

Yes, certainly.

Association of Municipal and County Engineers.

GLASGOW.—G. M. writes: "Please state the qualifications and course of study necessary to become a member of the Association of Municipal and County Engineers. I have had the usual training as a civil engineer and hold several South Kensington certificates."

Write to the secretary at 11, Victoria Street, Westminster, S.W.

'Area of Classrooms in Secondary Schools.

HIGH WYCOMBE.—SCHOLAR writes: "I recently prepared plans for some secondary day schools, and have been told that classrooms should give a minimum area of 18 sq. ft. per child. Some of mine have between 15ft. and 16ft. only. Is not 15 sq. ft. sufficient; and is there any limit to the total number of pupils for, say, seven classrooms?"

All classrooms in secondary schools must have a floor area of 18 sq. ft. per scholar, or 12 sq. ft. exclusive of a space for the master or mistress, which must be the full width of the room and 7ft. 6ins. from wall to front row of desks. No classroom should contain more than thirty nor fewer than fifteen scholars and all must have single desks. You should apply to the Board of Education for a copy of the building rules. T.

Removing a Church to Another Site.

In further reply to the enquiry on this subject, J. L., clerk of works, Edinburgh, writes: "Trinity College Church, Edinburgh (Gothic), was removed about 1848 to make way for the North British Railway under the supervision of the late Mr. David Bryce, F.R.I.B.A., R.S.A., architect. The stones were all previously numbered, then stored in an open field, and the church re-erected on its present site about twenty years later—or at all events a portion of it. 'Free St. George's,' Edinburgh, designed by the late Mr. David Cousin, the city architect, was removed about 1868 from Lothian Road to make way for the Caledonian Railway,

and was re-erected on its present site under the supervision of the late Mr. John Dick Peddie, R.S.A., architect. It is now known as Stockbridge U.F. Church, Edinburgh, with an addition to the height of the tower which improved it very much. This church should have 'A.L.'s special attention."

Mr. Harry Hems, of Exeter, writes: "Why not take the bull by the horns and move the fabric bodily? I have seen churches, both in the United States and in Canada, underpinned, lifted by jacks and moved on rollers. What man has done man can do."

On Becoming an Architect.

HINCKLEY.—C. A. W. writes: "What steps do you advise me to take in order to make my son, aged 16, an architect? He has passed the Oxford Junior, and will stay at school another year and take the Senior examination. Is it absolutely necessary that he be articulated to an architect in practice? What is about the premium required in this case?"

We advise that you should send him to the Architectural Association Day School in Tufton Street, Westminster, for a couple of years, and article him for three years to a young architect of standing who has a varied practice. The latter is most advisable; the premium varies from £20 to £200, according to the standing of the architect, but you would probably find £50 sufficient if the Architectural Association Day School course had been taken. You should apply to the secretary of the Association for particulars.

Ancient Lights.

KENSINGTON.—J. P. writes: "The accompanying plans (not reproduced) show a proposed new building and an adjoining ancient light. I have approached the adjoining owners, and the only reply I can get from them is that if I build it is at my own risk. Do you think there is a substantial interference with the right of light sufficient for the adjoining owners to obtain power to compel me to pull down the building if I go on with the work, or for them to obtain compensation; and if so, how much? Am I right in assuming that the interference of lateral light is a minor matter? There is at present an evergreen hedge 6ft. high where the new wall will come, which stops a portion of the light; and the ancient light in question is half-covered with ivy."

We do not think there will be any serious diminution of the amount of light. No doubt if the ivy were removed the lighting would be as good after the erection as before, but we doubt if the existence of this materially strengthens your case. It is the window, not the ivy. From the most recent legal decisions it appears that a person is only entitled to as much light as is necessary for the purpose for which the room is used, and in this case no material damage could be held to be done. We should risk an action, and if proceeded against should make the neighbour an offer for the obstruction of his light rather than go to court, unless he asks a preposterous sum. In the latter case you could only be made to pay compensation.

Building Trade Terms.

HULL.—A. G. writes: "Kindly explain the meanings of the following terms. I have referred to various books but have not been able to get what I want:—(1) *Spit*, referring to depth of soil to be removed. (2) *Flaunched*, referring to chimney-pots bedded in brickwork. (3) *Rubbed*, referring to the treatment of stonework. (4) *Stub*, connected with terracotta work. (5) *Verge*, connected with slater's work in roof. (6) *Dinged*, connected with treatment of walls for plasterer's work."

(1) "A spit deep" is the distance to which the ordinary spade is thrust in from the surface. (2) Applies to cementing round the

base of the chimney-pot. It means that the cement should be well carried or played up the chimney-pot, so that the weathering may be sharply inclined so as to throw the water off and prevent it penetrating and doing damage in frosty weather. (3) Ground to a smooth surface by rubbing with a stone or metal block or by placing one stone on another. (4) A stub or nib is a projection on the head of a tile for hooking over the lath. (5) A verge is that part of a sloping roof which projects beyond a gable or half-gable. Verge and the terms compounded with it are used in contrast to eaves and its compounds. (6) "Dinging" is an ambiguous term variously used for (a) the kind of rough-cast made by mixing small pebbles with cement and dinging or dashing it on with a trowel or shovel-shaped piece of wood; (b) in Scotland it is a word derived from the Scotch word "dinge," to dent, signifying the operation of forcing the mortar into joints of brickwork by means of a curved tool, or, as we call it in England, rule-, V- or beaded-jointing; (c) axing bricks to look like new; (d) rubbing the face of brickwork with a piece of coloured brick in order to give a uniform tint, generally before tuck-pointing; (e) a rough internal plastering in one coat pointed or ruled in to imitate brickwork, not necessarily following the actual joints. If the brickwork is fairly level the mortar may be laid on and then rubbed in with a piece of sacking, but if the bricks are rough the dinging must be more elaborate. For fuller details see paragraphs on p. 189 of our issue for November 4th, p. 205 of issue for November 11th, and p. 225 of issue for November 25th, 1903.

Adjoining Owners and Footings.

ILFORD.—F. F. F. writes: "There are two plots of ground. On one plot B builds a house with cellars. Therefore, the footings go down 6ft. or 7ft., and project 17ins. on A's ground, and in digging for same B has made a trench on A's ground about 5ft. wide at the top and about 2ft. at the bottom. A sells his plot, and the purchaser wishes to build his wall tight up against B's, but in doing so has, according to by-laws, to fill up the trench with concrete in order to form firm foundation for the footings, which only go down a foot or two, there being no cellar. Is the purchaser of A's plot required to excavate the made ground from trench (filled in by B) and to fill up with concrete at his own expense, or can he make B pay in any way?"

B ought, perhaps, to pay for the extra amount of concrete, but the matter is so small that it is not worth fighting about. After all, you have saved the cost of opening and filling in on B's land by reason of his footings having been built first.

Extras and Time-penalty Clause.

WILTS.—J. writes: "A certain job has taken longer than the period agreed to. There was a penalty clause in the agreement. The architect, however, altered the work as soon as the job began, namely, he required a brick plinth to be erected, and he altered the style of the brickwork from three courses of stretchers and one of headers to a header and stretcher work alternately, or Flemish bond. Red tiles were specified for the roofs, but after between 3,000 and 4,000 had been delivered on the site the architect asked for dun-colour tiles, which cost a good deal more. The construction of the roofs and one internal doorway was altered. Money has been detained for excavating which was not shown on the plans nor in the specification, and also the penalty for delay. What is the best course to take to enforce payment?"

It appears that you are entitled to receive payment for extras and also a time allowance; the architect ought to have given you due consideration, and if he refuses you should sue the client and him.

A NEW DANISH RAILWAY STATION. A. MELDAHL, ARCHITECT.

This new station on the Danish State Railway at Rungsted, Estre, comprises a central hall with a waiting-room to the left and luggage office to the right, with booking-office and station offices behind.

CHEAP COTTAGES EXHIBITION AWARDS.

THE judges appointed by the Committee of Organization of the Cheap Cottages Exhibition at Letchworth (Garden City) have made their awards as below. With two or three exceptions all the prize cottages have been illustrated in our columns, and the dates in brackets are those of the issues containing the illustrations.

The judges were Miss Octavia Hill, Prof. W. R. Lethaby, Mr. J. C. McCowan, Mr. R. Weir Schultz, Mr. Thackeray Turner, Prof. G. Sims Woodhead, and Miss Harriot Yorke.

It will be seen that they confirm the criticisms we made on the cottages.

Judges' Report.

In submitting our report we have to congratulate the promoters of the exhibition on the admirable response to their appeal. While a great deal remains to be done before the problem of rural housing can be considered as efficiently solved, we cannot help feeling that the collection of cheap cottages here brought together will help to achieve results which must be of immense service towards the end of obtaining suitable cheap cottages for the country labourer and artisan.

The site of the Garden City is particularly well chosen for economical building. Brick and sand are both cheap, lime is also moderate in price, and ballast and sand can be procured on the spot for the cost of digging and carting. The site is also within a comparatively short railway journey of some of the principal timber ports; timber for carpenters' work can therefore be delivered on the ground at a reasonable price.

The Cheapness of Bricks and Cement makes it possible here to erect substantial cottages at a price which will compare favourably with that of either timber-built houses of the same accommodation or of houses constructed of the various patent slabs or other processes, many of which are represented at the exhibition. We wish, therefore, to point out that, while the cost of the timber- or slate-built houses may be considered normal, the cost of the brick or cement-built houses is distinctly low—much less than it would be in many other districts where the price of such materials as brick, cement, sand, ballast, &c., rules higher. These facts must be taken into account and allowed for by the large section of the public who are visiting the exhibition, and who may otherwise be led astray somewhat by the prices attached in the catalogue to the various exhibits. We also desire to record our opinion that many of the competitors do not appear to have realized the problem put before them, and that a number of the buildings erected are not real cottages in the sense that they are suitable for the housing of a labourer or artisan and his family in the country, but may be more properly classed under the definition of pleasure cottages.

Opinion on New Methods of Building employed.

Some of the novel methods of building employed, while in many cases ingenious and economical, have not been sufficiently tested by time, and it is almost impossible to say whether they can yet be considered entirely reliable or suitable for permanent dwellings where the economical expenditure in upkeep has to be carefully kept in view. We cannot help feeling that

A Little More Ingenuity

might have been shown generally by competitors in overcoming customary defects or limitations, and in considering essential

details which make the difference between comfort and discomfort, and help towards a general higher level of healthiness. To instance only the important subject of ventilation, this seems to have received very little attention. The heads of the windows are usually some distance below the ceiling—in many cases between 2ft. or 3ft. This is undesirable from the point of view of efficient ventilation. There are hardly any cottages with double-hung sash-windows, and the ordinary hinged casement opening outwards, which has been almost generally adopted, has obvious limitations from this point of view, especially in single-storey cottages and in ground-floor rooms of two-storey cottages. Few cottages have windows divided horizontally by transoms with the upper lights hinged at top to push out, a suitable form of ventilation giving greater security than the ordinary side-hung window against rough weather and against easy access from the outside. No simple fastening has been exhibited which would allow of a window, say, on the ground floor being left slightly open without the possibility of anyone from outside opening it further in order to get access to a cottage in the occupiers' absence or during the night.

Other Points

need consideration, although we recognise that they are not all attainable in the cheapest class of cottages. The following are a few:—

1. The question of the copper. This necessary fitting is almost invariably placed in the scullery, and in a very few cases only has any provision been made for getting rid of the steam which in the ordinary way would fill the scullery and spread over the cottage. The more desirable place for the copper would be in an attached outhouse, as in exhibit No. 35; even to place it under a lean-to roof at the back of the cottage would be better than in the scullery.

2. Efficient provision for taking away the fumes of the cooking range. Each range should have direct means of ventilation.

3. The importance of having a small fire in the scullery which could be used only for cooking in hot weather, when a fire in the living-room would be otherwise unnecessary.

4. The construction of the fireplaces so as to allow of their giving the maximum of

heat with the minimum expenditure in fuel for cooking and heating purposes.

5. The desirability of having the chimneys within the building so as to economize heat.

6. The mitigation of variations of temperature, as in roof bedrooms, which are generally hot in summer and cold in winter.

7. The position of the e.c. This is often placed in close proximity to the larder—not a desirable position.

8. The advisability of having intercommunicating rooms to allow of supervision in the case of young children or of sickness.

9. Simplicity in roofing and the avoidance of valleys and excrescences generally.

We have paid a succession of visits to the exhibition, and have given our most careful attention to all the entries under the various classes. In submitting the following list of awards we have kept in view the conditions placed before the competitors—namely, relation of cost to appearance, accommodation, comfort, durability, fittings, suitability of material, and efficient workmanship.

Cottages.

CLASS I.—Cottages to cost not more than £150.

First Prize, £100.—No. 14. Messrs. Green Brothers, Whittington, near Chesterfield. Architect, Mr. Percy Houfton, Furnival Chambers, Chesterfield. (August 9th, p. 75.)

This cottage most nearly meets all the conditions. We have satisfied ourselves that it has been built for the sum of £150. The chief point against it is that the chimneys are in the outer walls. It will require a minimum of expenditure in upkeep. The walls are of brick, cement rough-cast on face. The roof is simple in form. The window stays and fastenings, the door-hinges and latches, and the fireplaces are especially commended. The following are some minor defects which are capable of being easily remedied:—The bedroom window heads are too far down from the ceiling. The larder opens out from the scullery. There is no provision for taking away the steam from the copper. The third bedroom has no fireplace, although one side abuts on a chimney. The stair window does not open.

Second Prize, £50.—No. 23. Messrs. Bennett & Bidwell, Letchworth.

This cottage is less substantial and the roof is not so simple. Minor defects:—There is no ventilation to copper. The larder wall is too slight. The outer scullery door is immediately opposite to the door of the living-room. The living-room fireplace is too near to the scullery door. There is a 9in. brick outside wall to the two most exposed faces of the living-room.

Third Prize, £25.—No. 35. Messrs. Potter & Co., 66, Victoria Street, S.W. (August 9th p. 79.)

This is a one-storey cottagē. It is built of concrete, rough-cast on external face and plastered on internal. The chimneys are in the centre. The roof is simple in form. The washhouse with copper is outside. We suggest that the front and back bedrooms might with advantage have a door of communication so that in the case of children they might be under direct supervision.

Prizes for wooden cottages: a wooden cottage being considered to be one built of timber between the roof and the foundations:—

First Prize, £50.—No. 80. F. W. Troup, 14, Gray's Inn Square, W.C. (August 2nd, p. 62.)

This is a good type. The chimneys are in the centre and the roof is simple in form. The principal objection to the cottage is that two of the rooms are entirely in the roof. There is a good and easy staircase. There is a fireplace in each bedroom. The copper has a hood for carrying away the steam. Minor defects:—The entrance door faces the east, and has no porch or efficient

ERECTING CONCRETE SLAB COTTAGE AT LETCHWORTH (GARDEN CITY).

J. S. GIBSON, F.R.I.B.A., ARCHITECT.

(Royal Academy Exhibition, 1905.)

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

protection. The e.c. is next the larder. There are thin boarded partitions between living-room and bedroom and between the staircase and upper bedrooms. The fireplaces are too close to doors. In upper rooms the window-heads are too far below the ceiling. There is no comfortable corner by the living-room fire, there being doors on both sides.

Second Prize, £25.—No. 81. Messrs. Smith & Brewer, 2, Gray's Inn Square, W.C.

This cottage has a good living-room. There is a good ventilated copper in the scullery. The stair is steep. The e.c. is next the larder. The living-room range looks inadequate.

CLASS 2.—For the best pair of five-roomed cottages (including scullery or kitchen scullery) erected at a cost not to exceed £300.

First Prize, £50.—No. 35. Messrs. Potter & Co., 66, Victoria Street, Westminster. (August 9th, p. 79.)

The remarks on the single cottage in Class I. apply to this pair also. The form of construction is novel.

Second Prize, £30.—No. 70. A. H. Clough, Burley, Ringwood.

In connection with this pair of cottages it may be pointed out that the form of the roof adopted is not desirable, unless required to meet the limitations of too stringent by-laws. Upright studding, weather-tiled on face, would conform to the by-laws in this district, would give better rooms, cramp the doors less, and be as economical a form of building as that carried out.

Third Prize, £20.—No. 67. The Copartnership Tenants' Housing Council, 22, Red Lion Square, W.C. (August 9th, p. 78.)

We suggest that a bay window is not required in a living-room of this size, that it is more costly than an ordinary window, and without compensating advantage as here placed. A simpler form of roof might be adopted over the central part of the building. The arrangement of the plan is rather wasteful of space.

Honourable Mention.—No. 32. Mr. G. P. Gooch and Mr. Curtis Green.

This is commended as a good simple type of cottage, but, as carried out, has defects of construction.

CLASS 3.—For the best group of three or four cottages, no one cottage to contain more than six rooms, including scullery, and erected at a cost not to exceed £35 per room.

Prize of £25 to No. 01, Mr. Geoffrey Lucas, A.R.I.B.A., 2, Vernon Place, Bloomsbury Square, W.C., and 23, Brand Street, Hitchin, Herts. (August 2nd, p. 59.)

We think that, for the price stated, better cottages could be constructed.

CLASS 4.—For the best detached cottage, or pair of cottages, each containing not more than six rooms, including scullery, and erected at a cost not to exceed £35 per room.

Prize of £100 to No. 79, Mr. A. Randall Wells, 25, Cornwallis Gardens, Hastings. (August 2nd, p. 62.)

This cottage has cost more than £150, but we consider it good value for the actual cost, £170. We suggest that the walls might with advantage be rough-cast outside; also that the partition between the central bedroom and lobby on first floor might, in many cases, be omitted, thus giving two intercommunicating rooms for parents and young children. The rooms are large and the offices are spacious. The chimneys are in inside walls. The plan is very well thought out. The fittings are simple and inexpensive. The sizes of the rooms generally may be thought to be on the large side, keeping in view the cost of warming in cold weather, and also the additional initial cost of building.

In addition the following prizes have been awarded:—

Prize of £100, offered by an anonymous donor, for the cheapest cottage for value given:—

No. 71. Mr. A. H. Clough, Burley, Ringwood.

This cottage contains the minimum of accommodation for a labourer and his family, viz., a living-room, scullery, larder, outhouses and three bedrooms. It is simple in form, is compactly arranged, and has been erected at a cost of £120.

Prize of £50, offered by the Associated Portland Cement Manufacturers (1900), Ltd., for the best cottage built of cement-concrete. No conditions were made by the donors in regard to the cost of the cottage, and the prize has been awarded under these special circumstances:—

No. 58. The Concrete Machinery Co., 18, Water Street, Liverpool. Architect, Mr. Gilbert Fraser. (August 2nd, p. 60.)

The method of construction, if found to be permanent, seems to be economical. The imitation of stone is to be deprecated.

Designs.

Prizes were also offered, and have been awarded, for the best designs of cottages, &c., on the same lines as the cottages themselves. These prizes have been awarded as follows:—

Class 1:—

First Prize, £10.—Messrs. Bennett & Bidwell, Letchworth.

Second Prize, £5.—Mr. W. A. T. Carter, 15, Waldemar Road, Wimbledon.

Class 2:—

First Prize, £10.—Mr. W. R. Mosley, 146, High Street, Slough.

Second Prize, £5.—Mr. W. Marshall, Hatfield.

Class 3:—

First Prize, £10.—Mr. Lionel F. Crane, Old House, Holland Street, Kensington.

Class 4:—

£10.—Mr. Geoffrey Lucas, A.R.I.B.A.

The special prize of £10 offered by Mr. H. G. Elwes, F.R.S., for the best design and specification of a wooden cottage, to be constructed entirely of English timber, has been awarded to the design submitted conjointly by Mr. Detmar Blow, of 9, King's Bench Walk, Temple, and Mr. Ernest Gimson, of Daneway House, Sapperton, Glos.

Accessories.

The following are commended:—

Wire bitumen damp-course by Vickers & Field, 6, Eldon Street, E.C.

Paving by Excelsior Patent Stone Co., Finedon Sidings, Northampton.

Ruberoid roofing (for temporary buildings) by Robert Blackwell & Co., 59, City Road, E.C.

Crane-rod casements (for their usefulness and ingenuity, although hardly coming within the margin of cost of a cheap cottage) by R. Whitbread, Carlton, near Nottingham.

Elkay & Cornes, Ltd.'s model cottage range, with copper combined (this also may perhaps hardly be considered as coming within the margin of cost of a cheap cottage).

The "Ideal" independent copper, with cover and steam exhaust, by Clark, Hunt & Co., 159-160, Shoreditch, E. (This copper is exhibited by several makers.)

Fred. Betts, Ltd.—range and oven in cottages Nos. 69-71.

Edwards's copper and hood in cottage No. 81.

The awards were delivered at Letchworth on Saturday before a large gathering.

After reading the report, Mr. J. St. Loe Strachey remarked that there had already been over 20,000 visitors to the exhibition, and a surplus of £150 was expected. It was intended with this sum to commission the winner of the first prize to erect another cottage embodying the suggestions of the

judges, so that it would remain as a model of what they considered a £150 cottage should be. It would be handed over to the Garden City, and would be kept as a museum for the designs that had been collected and other records of the exhibition, and it would be always accessible as a store-house of information to those who wished to study the question of cheap cottage building.

On Saturday afternoon a conference on housing was held. Alderman W. Thompson (chairman of the National Housing Reform Council), who occupied the chair, said he had derived from the exhibition the impression that the square plan of building under one roof, with the avoidance of additions, gave the minimum of wall-space and the maximum of area. He thought that most of the patent materials were more costly than bricks, and suggested that detailed particulars should be supplied showing the exact cost of labour and construction in each cottage as an indication where to look for economies. It was also important to state where the cottages infringed local by-laws. They were built under the by-laws of Hitchin, whose model code should be followed all over the country.

We give on the opposite page a photograph showing the erection of the concrete slab cottage designed by Mr. J. A. Brodie, M.I.C.E., city engineer of Liverpool. Plans and elevations of the cottage were given on p. 64 of our issue for August 2nd. Mr. Brodie has had some experience of the erection of such cottages as this one at Letchworth, having built several on the same lines at Liverpool, but one cannot help observing that, however cheap the work of erection might be when a dozen cottages were concerned, in this particular instance the scaffold with its traveller looks as if it would cost almost as much as the cottage! We are indebted to the "County Gentleman" for the illustration.

OUR PLATE.

THE new municipal buildings at Walsall are to be opened at the end of this month. The staircase is a great feature of the interior. The walls are finished in plaster and painted, while the decorative work is executed in Bath stone. The columns and the floor are of Sicilian marble and the ceiling of fibrous plaster by Mr. Gilbert Seale. The staircase is lighted by two stained-glass windows designed by Mr. Garth Jones and executed by Messrs. Abbott & Co., of Lancaster. The general contractors for the new building are Messrs. Armitage & Hodgson, of Leeds, the architect being Mr. James S. Gibson, F.R.I.B.A., of London.

Change of Address.—Mr. Herbert Goodman, A.R.I.B.A., has removed his offices from Walthamstow to Cranfield, Woodford Green.

The Royal Naval College at Dartmouth, the foundation-stone of which was laid by the King four years ago, was opened on Thursday last without formal ceremony. It has been erected at a cost of £300,000 from designs by Sir Aston Webb and Mr. E. Ingress Bell.

The Northampton Institute.—The book of "announcements" for the session 1905-06 has just been issued. The classes of the day courses commence on Monday, October 2nd, and those of the evening courses on Monday, September 25th. Full details of the syllabuses and the equipment are given.

Architectural Classes at King's College.—The various classes, day and evening, in the division of architecture at King's College, London, will begin during the first week of October. The curriculum recommended by the Board of Architectural Education has been adopted. A detailed prospectus can be had on application to the secretary at King's College, Strand.

BOILER SHOP OF MESSRS. MARSHALL, SONS & CO. LTD., AT GAINSBOROUGH. GLAZED ON MELLOWES' "ECLIPSE" SYSTEM.

Trade and Craft.

Glazing.

We have received a copy of a new catalogue just issued by Messrs. Mellowes & Co., Ltd., of Corporation Street, Sheffield, and 28, Victoria Street, Westminster, which should be extremely interesting and useful to architects, engineers and others. This firm's patent system of glazing for roofs, the "Eclipse," has now become such a standard thing in construction that its application in various positions and to various conditions is interesting to every professional man. The catalogue is well got-up and printed, and the illustrations are both impressive and instructive. We reproduce on this page one illustration showing the advantages of the "Eclipse" system for glazing large roofs, with its lightness, clearness and grace, and its particular fitness to jobs such as the huge engineering works of Messrs. Marshall, Sons & Co., Ltd., at Gainsborough. Among the other illustrations in the catalogue of work executed by Messrs. Mellowes are the Crystal Palace, Leeds electricity station, Birmingham Railway Carriage and Wagon Co.'s works at Smethwick, Vickers, Sons & Maxim's works at Sheffield, Cadeby Colliery, Yorks, slipway at Wallsend, Midland Arcades at Birmingham, and railway stations at Blackpool, Carlisle, Cheadle Heath, Edinburgh, Nottingham, Wemyss Bay, and Marylebone, Euston, King's Cross, London Bridge and Waterloo Junction in London—a convincing list.

There are a number of systems of glazing on the market, many of which are inefficient and very unsatisfactory after a few years. This is partially due either to the shape of the glazing bars or the materials of which they are constructed; zinc is a perishable material especially, while, as to shape, gutters may be blocked up and provision is seldom

made for condensation. In the "Eclipse" system the whole of the exposed parts are made of tin and lead, and after an experience of twenty-three years with the system in Sheffield, Woolwich and Manchester—towns in which the air is as destructive as could well be found—the bars are found to have been unaffected by atmospheric action. We publish below a section showing the form of the "Eclipse" glazing bars and the means by which water, dirt and dust are kept out. The bar will be seen to have three webs, which, unlike either copper or zinc, can be rubbed firmly against the glass. There are two webs above and one below, and great importance is placed on the smaller of the two top webs and on the one underneath. The steel bar gives the necessary strength and allows large spans to be covered, while it is prevented from rusting by a strong tin-lead metal cover which is soldered at both ends. There is no possibility of the glass being broken by expansion or contraction, and allowance is made for condensation to escape to the outside of the roof. The "Eclipse" system is easily applicable to hip roofs, domes and vertical or window glazing. One feature of the system is that, steel being used instead of wood, the size of bars is greatly reduced and more light

is transmitted into the interior of a building. The glass most frequently used is rough-cast plate. There are several sections of bars used, the particular one being determined by the length of the pane required. We illustrate No. 7 section, which is used for lengths up to 6ft 6ins. between bearings; No. 10 section can be used up to 11ft. The "Eclipse" metal cover can be adapted to suit the top part of a wooden bar, leaving only the underneath part exposed to the inside of the building (the steel is of course omitted in this case). The lead flashings generally used are of 5 lb. lead for ridges, bottom rails, valleys, hips and stiles, and 4 lb. lead for purlins. It is important to note that Messrs. Mellowes & Co. will guarantee to maintain any roof glazed on their system for a term of years.

Artistic Mantelpieces.

On more than one occasion we have remarked upon the great improvement in the design of mantelpieces and other woodwork shown in makers' catalogues; this improvement being generally associated with a reversion from the degraded cast-iron types of the Victorian era and the adoption of wood models treated with restraint and taste. A number of designs for such mantelpieces are given in the new catalogue which has been sent to us by Messrs. Crosby & Co., of Farnham, and we can confidently recommend readers to obtain a copy for themselves. The firm make a feature of this work, and have also introduced the "log back" fire on hearth to burn coke, coal or wood, the "log back" being in one piece of fireclay and adapted to almost any room at very nominal expense. It is made in sizes from 12ins. to 24ins. wide by 30ins. and 36ins. high, with straight, circular or octagonal front, and can be supplied with any kind of tiles to suit surrounds and hearth.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, Great New Street, Fetter Lane, E.C. Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Aberdare.—For the erection of twenty houses on the site of Abergwawr Brewery, for Mr. and Mrs. Taliesin James. Mr. Aneurin T. James, architect and surveyor, Hawthorne House, Gloucester Terrace, Aberdare:—

THE INSTITUTE OF SANITARY ENGINEERS, Ltd.

PRACTICAL SANITARY SCIENCE. EXAMINATIONS IN PRACTICAL SANITARY SCIENCE AND ENGINEERING, and qualifying for admission to the Institute, and Students' Examinations, will be held on November 24th and 25th, 1905, in London, Sheffield, and Birmingham.

STUDENTS' LECTURES. A Course of Lectures, preparing Candidates for Examinations in Sanitary Engineering, commences on Tuesday, October 3rd, 1905.

Further particulars as to Membership Examinations, Students' Classes, &c., may be obtained at the Offices of the Institute, 19, BLOOMSBURY SQUARE, LONDON, W.C.

Educational—cont.

THE ARCHITECTURAL ASSOCIATION.

COURSES OF INSTRUCTION IN ARCHITECTURE.

The Day and Evening Continuation Schools will open on Monday, September 25th. Intending Pupils are requested to forward their names to the Secretary as soon as possible.

The Evening School also opens on this date at 6.30 p.m.

A pamphlet containing full information as to the classes and advantages of membership may be obtained on application to the Secretary, 18, Tufton Street, Westminster, S.W.

HENRY TANNER, JR., } Hon. Secs.
 A. MARYON WATSON, }

UNIVERSITY OF LONDON EXTENSION.

LECTURES ON ARCHITECTURE.
 SOUTH-WESTERN POLYTECHNIC.
 MANRESA ROAD, CHELSEA, S.W.

A COURSE of twenty-four LECTURES and four DEMONSTRATION VISITS to museums or buildings, specially considering the merits of the different styles and the suggestions they afford for design, will be given by BANISTER FLETCHER, F.R.I.B.A., Lecturer on Architecture at the Architectural Association.

The Lectures are amply illustrated by large lecture diagrams and lantern slides, and are followed by sketching classes from the Lecturer's diagrams.

They are especially useful for Art students and others preparing for the examinations of the Royal Institute of British Architects, and the Board of Education in Architecture and Historic Ornament, and for the Certificate of the University Extension Board of the University of London.

The first lecture is on WEDNESDAY, OCTOBER 4, at SEVEN p.m.

Fee for the course, 10s.

A detached syllabus (price 6d.) can be obtained.

COURSES OF INSTRUCTION are also given in:—
 BUILDING CONSTRUCTION AND DRAWING,
 CARPENTRY AND JOINERY, PLUMBING,
 BRICKWORK, PAINTING AND DECORATING.

For details and fees see prospectus.

Competitions Open.

BOROUGH OF BRIDLINGTON.

TO ARCHITECTS.

COMPETITION.

The Corporation of Bridlington offer premiums of 35 guineas and 20 guineas for first and second designs respectively for a LARGE SHELTER or CONCERT HALL, with CAFE, on the Royal Prince's Parade, Bridlington.

Particulars, giving further information may be obtained on application to the Town Clerk.

Designs, accompanied by estimates, under seal and non-de-plume, and marked "Royal Prince's Parade Concert Hall," to be sent to me not later than the 20th of October, 1905.

By Order,

A. E. MATTHEWMAN,

Town Clerk,
 15th September, 1905.

Contracts Open.

TO BUILDERS.

CONVALESCENT HOME, HUNSTANTON, NORFOLK.

TENDERS are invited for the erection and completion of a NEW BUILDING FOR CHILDREN.

Copies of bills of quantities may be had on application to the Architect, A. PAUL MACALISTER, F.R.I.B.A., 20, St. Andrew's Street, Cambridge, accompanied by a deposit of £2 2s., which will be returned on receipt of a bona fide tender.

The Committee do not bind themselves to accept the lowest or any Tender, and the Contractor may be required to find sureties for the due performance of the contract.

Tenders are to be delivered in the envelopes provided to the Hon. Solicitors, Messrs. BELOE & BELOE, King's Lynn, on or before MONDAY, SEPT. 25th, at 12 noon.

Plans may be seen at the Home, or at the Architect's Office, or at our Offices, between the hours of 10 a.m. and 4 p.m.

BELOE & BELOE.

BUILDERS' JOURNAL INSURANCES.

The following list is interesting, as it gives particulars of some of the claims that have been paid under the BUILDERS' JOURNAL Insurance Schemes. The ease with which an accident happens, and the heavy expense often incurred by doctors' bills and loss of occupation are subjects that every thoughtful man has to consider, and there could not be a better method of protection than such Insurance policies:

Builder.—Injury to left arm necessitating amputation. £750.

Architect.—Slipped down steps while carrying bicycle. £6.

Builder.—Kicked by horse. £10 10s.

Architect.—Trod on rusty nail, which entered toe. £4 10s.

Architect.—Slipped on floor, and in falling struck arm of chair. £1.

Builder.—Injured face, left eye, and foot. £6.

Only subscribers to the BUILDERS' JOURNAL are entitled to benefit under our Insurance Schemes, which are guaranteed by "The Ocean Accident and Guarantee Corporation, Limited." A pamphlet giving particulars will be sent on request, and every subscriber should avail himself of one of the following Three Schemes of Insurance.

These are the three Schemes:—

(1) A Free Accident Insurance of £500.

(2) An Accident Insurance of £500.

And also

£250 for Permanent Total Disablement.

£2 10s. per week for Temporary Total Disablement.

Premium, 1/-

(For the conditions under which policies Nos. 1 and 2 are issued readers should refer to our pamphlet, sent on application.)

(3) An Accident Insurance of £1,000,
 £500 for Permanent Total Disablement,
 £6 per week for Temporary Total Disablement,
 with special advantages fully detailed in our pamphlet.

THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

September 27, 1905. Vol. 22, No. 555.

6, Great New Street, Fetter Lane, E.C.

Summary.

Speaking on decoration last Wednesday at the painters' and decorators' conference at Plymouth, Mr. Haité said that while recognizing their achievements as painters he felt that possible decorative conceptions by men such as Burne-Jones, Rossetti and William Morris were lost for the lack of a technical training which should have been elementary to them. (Page 174.)

The architecture of the Liège Exhibition is of no great importance, though included in it is a splendid new bridge. The most striking part of the temporary work is, perhaps, the monumental entrance, which is of the light grandiloquent character customary in exhibition design. The main buildings are very irregularly laid out, and add nothing to the subject of exhibition planning. (Page 176.)

Shearing stresses in masonry are no less important than compression stresses, and need to be taken into account when designing masonry structures. (Page 187.)

The late Mr. Waterhouse died worth £163,575. (Page 182.)

The Victoria Embankment up to date has cost something like two millions. Tar macadam is now being put down experimentally, as the roadway, though often repaired, has hitherto been very unsatisfactory. (Page 180.)

Mr. Thornycroft's memorial to Mr. Gladstone, westwards of St. Clement Danes Church, in the Strand, is to be unveiled on October 21st. (Page 181.)

Splendid new tapestries worked on the Morris looms at Merton Abbey have been arranged in conjunction with Burne-Jones's "Adoration" subject as a war memorial in Eton College Chapel. (Page 178.)

Centres for domes and arches are usually constructed in position piece by piece, previously fitted and marked, rather than built complete on the ground and slung into position with a crane, which would be liable to distort them. A very novel centering was used by Prof. Beresford Pite at Christ Church, Brixton. (Page 180.)

Paris is up in arms against a proposal that part of the Bois de Boulogne should be allotted for building purposes. (Page 181.)

At the new central baths at Bradford, just opened, the dressing-boxes, instead of being arranged around the swimming-bath as usual, are grouped in an adjoining apartment, and can be taken down so as to leave the room clear for concerts, &c., in winter time. (Page 182.)

A test recently carried out for our special information shows that hollow terra-cotta blocks can be used for constructing partitions to safely take the load from joists of any ordinary span, and are thus fully equal in stability to brick partitions. (Page 184.)

Baths and Bathrooms.

WHEN we look at the ruins of ancient palaces and villas in Italy, Greece and Spain we see what a great place the bath has taken in the planning. A special room was usually devoted to it, consisting of a shallow pool with perhaps a fountain in the centre and flower plots and vases disposed around. This compartment was very often open to the sky, but was also sometimes covered. From an inspection of Pompeian houses it has been suggested that the central court in which the bath was placed was the origin of the crossing in the early Christian churches, and that this led to the cross type of plan. Of course in Eastern climates the bath must necessarily be a very important feature; and in Persia and India to-day in all the large houses it is the subject of almost as much attention as it was in the days of Greece and Rome. In northern latitudes, however, it is not such a necessity, and has in fact been practically ignored. Only of recent years have we understood the hygienic value of bathing, and the bathroom has become a necessary adjunct to the modern house, while the provision of public baths is now a feature of municipal enterprise. It seems strange that the bathroom should not receive more careful attention at the hands of architects. The charm of a court with a shallow bath and fountain opening from the living-rooms has been overlooked in the designing of large houses. The old model might be again adopted, though naturally it would not be advisable to have it open to the sky, as permissible in a warmer climate; but there seems no reason why the bathroom and the conservatory should not occasionally be combined. Means could easily be taken to allow the bathroom to be enclosed at any time when the inmates required to perform their ablutions. We recollect one small design in an Academy exhibition where a bathroom of this type opened out of the studio in an artist's house, and this must have been most charming. The decoration of the floor and sides of such a bath in mosaic and the walls in tiles suggest boundless possibilities. In smaller houses such a bathroom would be out of the question, but even in this case the matter deserves attention. There are now such a number of fittings, each having its special advantage, that the provision of a simple sofa bath is not sufficient. There are the shower bath, sitz bath, vapour bath, and lavatory, all of which might be required in a large bathroom. Where space is restricted, as in very small houses or cottages, the folding bath now offers a solution to the difficulty, but in dwellings for the working classes the advisability of a bath is somewhat doubtful. It is very often used as a receptacle for rubbish,

and only increases the cost. In towns the public baths allow persons to bathe regularly if they so desire—which many do not—but, as regards the country cottage, we notice that only on Saturday last Miss Constance Cochrane, of the Housing and Sanitation Association, at a conference held at the Garden City, Letchworth, said that as a result of a canvass of fifty families in seven villages in Cambridgeshire, Huntingdonshire and Bedfordshire, very few expressed a desire for a bath, being satisfied with the tub.

It is only in the nature of things that scaffold accidents should frequently occur, but the inquest held at the City Coroner's Court last week on a painter who was killed while at work on a building in Upper Clapton was the occasion for some suggestive remarks by one of His Majesty's Inspectors of Factories and by Dr. Waldo, the coroner. The evidence showed that on Tuesday last week a painter was standing on a gin plank painting a window on the first floor of a building in course of construction, when he fell and broke his back. The plank on which he was standing was found to be undamaged, so that he must have overbalanced himself. Mr. Davison, His Majesty's Inspector of Factories, said that there were no compulsory regulations for safeguarding scaffolding. The Home Office had made certain regulations, but at present they were merely optional. Nothing was easier than for a man working on a scaffold to tumble, and so long as building operations were carried on in the present way he was afraid these accidents would continue. Asked if the Home Office intended to make these regulations compulsory, he said this might be done, but the present regulations would hardly touch this particular case. He also said that the district surveyor had very little power to control scaffolding. After the jury, in returning their verdict, had expressed the opinion that steps should be taken to see that precautions were observed in the case of workmen engaged on scaffolding, the coroner very sensibly remarked that the difficulty was as to where the precaution was going to end; he supposed workmen were bound to take some risks. It will be recollected that the London County Council, in the Bill for amending the London Building Act which they placed before Parliament last session, proposed to regulate scaffolding on buildings, and we do not see that builders could have any legitimate objection to being held responsible for scaffolds made in accordance with any regulations intended to safeguard the lives of workmen; but of course these regulations should be sensible ones and not too stringent.

(Royal Academy Exhibition, 1905.)

This stable is now being built. It is of local purple-grey stocks with red window dressings and quoins. The roof is to be covered with old tiles. The accommodation on the ground floor is shown by the plan. There is a loft over the main stable and a groom's room over the harness-room. Mr. George L. Alexander, of London, is the architect and Mr. James Jackson, of Bramley, the builder.

PAINTERS AND DECORATORS IN CONFERENCE.

UNDER the presidency of Mr. H. Vigurs Harris the twelfth annual convention of the National Association of Master House Painters and Decorators of England and Wales was held at Plymouth last week. The proceedings opened on Tuesday with a reception at the Guildhall, followed by the opening of the exhibition of painters' and decorators' materials by Sir Joseph Bellamy. Various reports from different committees were received.

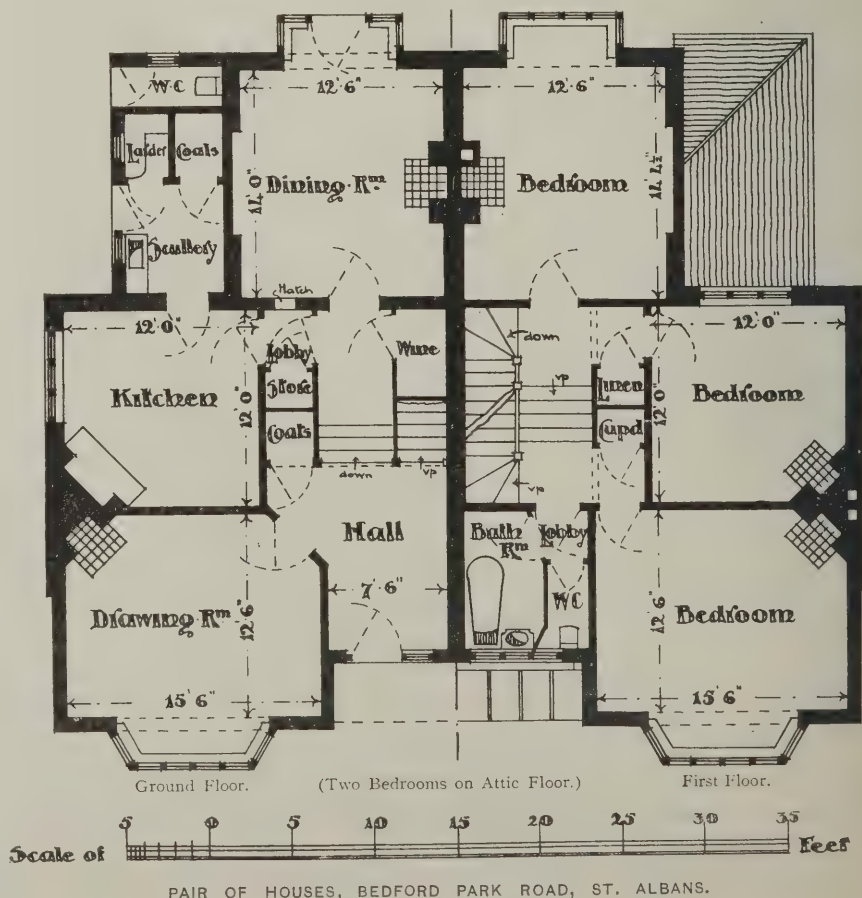

The Contract System.

In the course of his presidential address Mr. Vigurs Harris said that until about ten years ago the house-painting and house-decorating trade was rather on the down grade. On the commercial side there had been a distinct depreciation; workmen were not so qualified as they were thirty or forty years ago; the unhappy side of trade unionism was sometimes unduly predominant, and there had been a scarcity of good and steady operators. He thought, however, through the energy and service of the Association they were beginning to alter that state of things. He had tried himself to determine the reason of the decadence, but he had never been able to discover any satisfactory explanation, saving the alteration in the public method of having work done. They had changed from the old-time method of keeping the man who had served them well, and the whole of the public—public bodies especially—accepted the system of contract by public tender. He believed that the system of wild and almost unchecked competition had had a most disastrous effect on a great many branches of the building trade, and not least upon the trade of the painter and decorator. The reason was that when things were reduced to their lowest level, and a man did not know whether he would get out with 5, 10 or 20 per cent. profit or loss, he did all he could to save himself from loss. What was the result? Apprentices were no longer so carefully trained, because they were turned into money-producers. But he thought the day might come when the public would have some method which was rather more scientific than that which obtained at the present day.

On Wednesday Mr. G. C. Haité, R.I., read a paper on

The Future of Decoration in this Country. He said the fine arts were not the cause but the effects of the commercial energy and prosperity of a nation, while the applied and industrial arts were just the opposite. He would be a courageous man to prophesy on the future of decorative art in Great Britain, but as one who had seen the changes of the past thirty years he might be permitted to speculate on the subject.

Decorative and applied art was governed absolutely by rules and laws which, if observed, would dignify even the ordinary achievement by its intelligence and fitness, but if avoided would nullify the greatest efforts of genius and render them examples of misapplied efforts. These principles of law were impartible, and should be imparted. Art could not be taught, but inherent abilities could be directed. The knowledge of the governing laws of art could be imparted, and must tend to the appreciation of art.

The Royal Academy schools had provided professors of painting, sculpture, architecture, anatomy and chemistry. Had not the time arrived for a professor of decoration — of applied design? Truly the why and wherefore of much of the past mischief was to be laid on the Royal Academy, which had dominated the fashion and educated the public to regard decoration as something quite inferior to painting. The painters had received honour denied to the other branches, so that able men had been content, if not compelled, to be known by a third-rate picture rather than as masters in any other phase of art.

What good has Pictorial Art done?

One was bound to ask: What had pictorial art, even of the most exalted kind, done for the nation? In comparison with architecture and the applied arts, had it assisted in the making or moulding of its greatness? Would it have retarded our advance, or would our position to-day be other than it was had pictorial art never flourished? The advancements and achievements in the name of art which had added to the nation's reputation and wealth had been in the direction of design, architecture and sculpture, and that too in most cases by men who worked and died, neglected in life, forgotten in death, and unknown to the majority of self-dubbed, so-called artists.

But decorative art and the claims of decorative artists were coming to the fore, and if from indifference decorators failed to take advantage of this, it would be their own fault. The fearless expression of honest opinion was needed. The dogma of a painter, even if that of a Royal Academician, was not to be accepted because he presumed on such distinction. They should not accept these self-elected teachers when they used their names to deal with matters of which they were practically unfamiliar, even when they came with an alphabet of letters behind their names or surrounded with all the glamour of knighthood, inevitably associated though that honour must always be with the makers of jam and purveyors of bacon. There was an increasing number of painters who were ambitious of being accepted as

Decorative Artists,

and if they would sink their pride and submit to be taught the principles of decorative art by those competent to teach they might get within a reasonable distance of their ideals and ambition. The stained-glass windows of Sir Joshua Reynolds and the lions of Sir Edwin Landseer, one would have thought, were warnings enough; and while recognizing their achievements as painters, he felt that possible decorative conceptions by men such as Burne-Jones, Rossetti and William Morris were lost for the lack of a technical training which should have been elementary to them.

Incompetent Teachers.

The national schools of design had produced few artists, and still fewer those trained in the understanding of art. It was not too much to say that the majority of art teachers and directors were in such positions not by inclination or endowment, but were driven there by want of opportunity from exercising their abilities in the direction they might have been more or less trained in, and in many cases there were men instructing students to work on lines and in a profession in which they themselves had found nothing but failure and disappointment. The progress of art generally had been retarded by association with political faith; on the other hand, he would welcome a stronger religious faith than had been shown in the last decade, if only for art's sake.

In these days of multitudinous schools of art it was common to find a host of amateur decorators, bookbinders, metal-workers, &c., all possessed with a carefully trained "mis"-understanding.

PAIR OF HOUSES, BEDFORD PARK ROAD, ST. ALBANS. HAROLD GOSLETT, A.R.I.B.A., ARCHITECT. (Royal Academy Exhibition, 1905.)

These houses are built with local red facing bricks, cement rough-cast, and Bedfordshire tiles. In consequence of the site being 6 ft. below the level of the road, it was found necessary for the sake of economy to arrange the front and back rooms on different levels. In order to obviate the many objections of having the kitchen, bathroom and w.c. opening direct on to the hall or landing—a common fault in houses of this size and class—they have been cut off by lobbies, the kitchen lobby at the same time forming a servery to the dining-room. The total cost of the pair of houses, inclusive of the architect's commission, was 7d. per ft. cube. The builders were Messrs. Vail & Williamson, of St. Albans.

In conclusion he expressed the belief that there was a good time coming, when shoddy material and indifferent work would not be tolerated. What was likely and desirable was the broader and more liberal mind of the better educated in such matters and the knowledge which would see through the mask of humbug and sham. He ventured to predict that the future of decoration and decorative art would be more in the hands of those properly trained and would be regarded as worthy to rank with the other arts, that there would be additional professorships at the Royal Academy of Arts, and that the trade would work under conditions that would cause good work to be recognized, appreciated and equitably remunerated.

The Manchester School.

Mr. A. E. Bramley headmaster of the Association's painting school at Manchester, read a paper on "Methods of Training for Decorators." He gave an interesting description of the daily routine, methods and ideals

of their school. The Saturday morning work, he explained, was of a general and interesting type. Then all the sketches and note-books were examined and marked, whilst the students' studies and designs for the week were placed on the walls and criticized by the master, so that the defects as well as the merits of each student became a lesson and instruction to all. Another feature of the morning was the training of the powers of memory and observation by drawing without copy some well-known object or work which had been previously executed in the school or sketched from a design which had been exhibited for, perhaps, a minute or so and then withdrawn.

The fifth annual meeting was also held on Wednesday afternoon, when Mr. J. H. Turner, of Wakefield, was elected president for the ensuing year; Messrs. Contrall (Manchester), Teal (Birmingham), Smyth (West Hartlepool) and Evans (Bristol) being appointed vice-presidents, and Mr. J. W. Bellamy (Birmingham) elected treasurer.

LIEGE EXHIBITION: MAIN FACADE WITH MONUMENTAL ENTRANCE TO THE INDUSTRIAL AND MACHINERY HALLS.
HASSE AND SOUBRE, ARCHITECTS.

THE LIEGE EXHIBITION.

THE international exhibition which is being held this year at Liège cannot be ranked with similar exhibitions of its kind held in previous years, although undoubtedly of considerable importance to Belgium and France. It was promoted at an auspicious time, for this year is the seventy-fifth anniversary of the declaration of Belgian independence, and celebration fêtes have been held on a most lavish scale in all the large towns.

Liège offers an admirable centre for such an exhibition. It contains over 175,000 inhabitants and is surrounded by numerous large works which give employment to many thousands of people who might be expected to visit the exhibition.

The architecture of the exhibition is not of great importance; in fact, it is distinctly inferior to that of smaller exhibitions, such as Wolverhampton or Dusseldorf. The Glasgow exhibition was of much greater merit and far superior to this in architectural treatment.

The total area covered by the exhibition is more than 170 acres. It consists of four

sections, the three most important being near the junction of the Ourthe and Meuse, while the fourth is in the Parc de Cointe. It is to be noted that the course of the Ourthe has been diverted from its original bed into a new canal called the Canal de Derivation, whilst the old bed of the river, which formerly made a sweep round what are now the exhibition grounds, was filled up and thrown into the area of the exhibition. This necessitated the construction of several bridges, and various other improvements have been made to the city, all of a permanent character and adding considerably to its beauty and the possibility of extension in the suburbs. One of these new bridges, the Pont de Fragnée, is a very fine work, as will be seen by the photograph reproduced on this page. The River Meuse is here about 600ft. wide and the bridge (of the three-hinged arch type) is remarkably light in construction, recalling the Alexander III. bridge at Paris, but not overlaid, as that bridge is, with lamp standards. It shows the ability of foreign architects and engineers in designing fine construction. The columns at the ends of the bridge are decorated with

sculpture by a Belgian artist, Victor Rousseau. M. Demany was the architect. The constructional work was executed by the Société Anonyme John Cockerill, the well-known engineering firm of Seraing.

The main portion of the exhibition is situated partially in the parks of the Acclimatation and Boverie. The former is the old "Zoo" of Liège, while the latter, where the palace of fine arts is situated, used in former years to be specially favoured by cyclists and members of the rowing club.

There are several entrances into the exhibition. Visitors arriving at the Guillemins station would probably first enter the Fragnée, which is devoted to side-shows, and would then cross the new bridge and enter the portion called Old Liège, which consists of reproductions in plaster of old buildings in the city, somewhat on the lines of Old London at Earl's Court.

Again crossing a bridge, the Pont de Fétinne, we arrive at the Vennes—the industrial quarter—where the Palais des Fêtes and the industrial and machinery halls are situated. Returning again, but taking another bridge, the Pont Hennebique

THE NEW PONT FRAGNEE OVER THE MEUSE AT LIEGE, CONNECTING PORTIONS OF THE EXHIBITION. DEMANY ARCHITECT.

constructed of reinforced concrete on the Hennebique system) we reach the Parc Boverie, which is an island and contains the Palace of Fine Arts, the Canadian pavilion, the Palace of Ancient Art, the Palace of Women, and pavilions of the Congo, Tunis, Montenegro, Servia, &c. At one end of this island is the main entrance to the exhibition, near the centre of the city. In the portion removed some distance from the main portion, namely, the Parc de Cointe, are the Palace of Horticulture, the sports ground and the botanical gardens. The English section is a small one; and although it inadequately represents this country, the exhibition is not of sufficient importance to warrant much display.

The main industrial and machinery halls, illustrated on the opposite page, were designed by MM. Hasse & Soubre, the architects of the exhibition. The main front is the only one of importance, the rest of the buildings being constructed of galvanized iron on a light framing and having no pretensions to architectural effect. The planning is also very irregular, and adds nothing to the subject of the design of exhibition buildings. The façade, it will be seen, has a main entrance of the light grandiloquent character that is customary in exhibition design, being flanked on either side by towers. The main entrance is domed and decorated with paintings that give a rather pleasant impression with their remarkable wealth of colour. At the foot of the horse-

PAVILION OF MONTENEGRO. CARBONARE, ARCHITECT.

shoe arch are large groups of statuary. The central avenue leading from this entrance contains exhibits of bronze, decorative art, jewellery, furnishing and glass, on the left-hand being the French, Dutch, Russian, Turkish, Austrian, Swiss and the social, economy, hygienic and educational Belgian sections; while on the right-hand side of the avenue are the German, English, Chinese, American, Italian and Japanese sections, and the civil engineering, scientific, commercial and chemical Belgian sections; and finally behind these the machinery hall—the largest and most important part of the exhibition.

Among the exhibits there is very little of note as regards the building trade. The social economy and hygienic sections contain a number of plans of small houses for workmen, showing that Belgium also has its housing problem, but the plans offer no suggestions to English architects, and in the majority of cases they are far inferior in design and economy. One notable point about the exhibits in these sections is that architects in Belgium are not above advertising themselves. Several men of eminence have taken special stands upon which they display perspectives, photographs and plans of buildings which they have executed.

Reinforced concrete is now considered of great importance in Belgium for the construction of buildings, and all the well known foreign firms are represented at the exhibition.

Adjoining the main building is the Palais des Fêtes (illustrated on the next page) in which all the important meetings, international congresses, lectures, fêtes, concerts, &c., have been held.

Coming to the Boverie portion of the exhibition, the city of Liège is represented by a permanent structure in the old half timber, stone and brick style typical of Belgium. In this pavilion the three municipal departments—the public works, education and the état civil—have representative collections of exhibits, the first being especially interesting, as it deals with sewage and waterworks and architecture. Near this is the pavilion of Servia, in the form of a Servian monastery, with white walls and a red-tiled roof, designed by M. Dainef, of Liège. Next to it is the pavilion of Montenegro, also in Servian style,

MONUMENTAL ENTRANCE LIÈGE, EXHIBITION.

designed by M. Carbonare, of Venice. We illustrate this pretty little building.

Adjoining is the Palais des Femmes, in which are shown examples of women's work; a number of lace workers and others are actively engaged therein. This building is in the simple French Renaissance style. Opposite is the Palace of Ancient Art, which is without distinction, although the centre of the façade represents the old town hall of Liège, which was destroyed in the seventeenth century, while other parts represent the fronts of various old houses of the city. This conglomeration makes the building absurd.

Next to this is the Canadian pavilion, the size of which is another indication of the enterprise of this go-ahead British colony. Adjoining is the Palace of Fine Arts, a permanent building constructed of stone and containing works by contemporary artists. It is divided into four sections, the first dealing with paintings, the second with sculpture, the third with prints and lithographs, and the fourth with architecture. The area of the building is about 2,500 square metres; it is intended to be used after the exhibition as a municipal art gallery and for concerts, receptions, congresses, &c.

The Tunisian, Algerian, Bulgarian, African, Asiatic and Congo pavilions are small structures of the usual fanciful exhibition type.

Taken as a whole, therefore, the exhibition can hardly be ranked an international one, though thoroughly representative of Belgian enterprise.

BURNE-JONES AND MORRIS TAPESTRIES AT ETON.

THE Eton College war memorial has now been completed, so far as the chapel is concerned, by the erection of three large figure tapestries, which envelop the new communion table of black marble, and cover the east end wall up to the painted cornice. The centre-piece is the well-known "Adoration" subject by Burne-Jones, which was made for the chapel some years ago and has hitherto hung facing the doorway, on the south wall. This has now been flanked on either side by new tapestries worked on the Morris looms at Merton Abbey, and containing pairs of angels reproduced from the Burne-Jones windows at Salisbury Cathedral. The art of weaving these tapestries was re-discovered by William Morris partly through an old book and partly by manual experiment. It is the ancient Gobelins method, long since lost or abandoned by the Gobelins and now practised nowhere but at Merton. The work is entirely done by hand, and is largely at the discretion of the workers, who must themselves be trained artists. It is for this reason probably that Eton authorities have permitted the names of the craftsmen to be worked in a narrow border along the top of one wing. The wings have taken eighteen months to weave and cost over £1,100. The "Adoration" tapestry, which was placed in the chapel ten years ago, took a year, and cost £525.

The new Sea Wall at Galveston, where, it will be remembered, a great tidal wave swept over the city some time ago, has been completed, and side by side the whole city has been lifted to the height of its protective barrier. The wall is of concrete 17ft. high and running along the Gulf for $4\frac{1}{2}$ miles. It is 16ft. thick at the base and 5ft. across the top. The wall is built on a foundation of piling, the piles going down 45ft., and it is protected from undermining by the Gulf waters by an apron of stiff shingle, as well as by a row of piles driven in front of the wall. In raising the city 2,500 houses have been lifted.

PERMANENT PALACE OF FINE ARTS, LIEGE EXHIBITION. HASSE AND SOUBRE, ARCHITECTS.

PALAIS DES FETES, LIEGE EXHIBITION. HASSE AND SOUBRE, ARCHITECTS.

THE CANADIAN PAVILION AT THE LIEGE EXHIBITION.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Charge for Writing a Specification.

LIVERPOOL writes: "What do you consider a fair charge for writing a specification for alterations to a building costing about £1,000?"

About five guineas.

Work Abroad.

ARBROATH.—R. P. S. writes: "Would it be advisable for a carpenter to emigrate to New Zealand, and if so which would be the best part to go to?"

We believe New Zealand offers plenty of opportunities to carpenters and joiners. You can obtain full information from the Emigrants' Information Office, Broadway, Westminster.

Damage to Building by Excavation for Sewer.

BLAINA.—JAGO writes: "A has built a house up to the roof. B came on next to the pine end and began to excavate for a 6in. sewer 14ins. from A's pine end, and has excavated 7ft. under A's foundation. Now the pine end has cracked through, and is leaving front and back walls. B never rammed the ground, having simply filled in with loose rubbish. What is my remedy? Can I make B repair the pine end?"

We think you are entitled to claim damages. Put the matter in the hands of a solicitor.

Plans for Heating a Church.

THIRSK writes: "In July, 1904, I submitted a plan showing a scheme for heating a church. I sent the plan to the rector, at the request of one of the churchwardens. The business has since been placed in the hands of an architect, who has had the church heated from plans submitted by him, and although I never asked for my plans to be returned when I submitted them, I have since asked the rector to let me have them back. Am I entitled to them, and if not returned can I charge for them?"

Yes, you are clearly entitled to have the plans returned or paid for.

Soundproofing and Stiffening a Floor.

WIMBLEDON.—R. C. W. writes: "The occupants of a bedroom complain of the great noise and shaking on the floor above. What is the best means of curing this? The floor is a wooden one consisting of 11in. by 2in. joists, span about 19ft. The room overhead is used largely as a passage. The bedroom must be disturbed as little as possible. Is there any other method besides pugging? And which is the readiest way to stiffen the floor? There are already two rows of herring-bone strutting."

We think the floor might be stiffened by the following means:—Place a flat iron bar 2ins. wide by 1in. thick longitudinally in the centre of the span under the middle of all the joists, and anchor it into the end walls. Then pass rods $\frac{1}{2}$ in. diameter, with screw joints, over the tops of every other joist near the ends, and secure with staples. Incline the rods down close by the sides of the joists until they pass under the bar, and tighten with the screw joints. The floor would thus be trussed up. The soundproofing should be done by slag-wool pugging.

Preservative for Decayed Stonework.

CHESTER.—M. writes: "The stonework of a building built of Talacre stone is badly weathered and laminated, and some parts are being forced off by decay. It has been suggested that the worst parts should be re-faced and the whole treated with 'Fluate' stone preservative. Is this a suitable preparation for this particular stone; how should it be applied; from whom is it obtainable; what is its cost; and can you name any building upon which it has been used?"

"Fluate" is suitable for preserving lime-stones, but as Talacre stone is a sandstone we would advise the use of either Szerelmey stone liquid, supplied by N. C. Szerelmey & Co., of Rotherhithe New Road, London, S.E.; Silicate Zopessa solution, supplied by the Granite Paint Co., Ltd., of Creek Road, Deptford, S.E.; or Browning's colourless preservative solution, supplied by the Industrial Paint Co., Ltd., 31, Cannon Street, London, E.C. "Fluate" is made by the Bath Stone Firms, Ltd., Bath, from whom all particulars can be obtained.

Attics.

LONG EATON.—DERBYSHIRE writes: "Some cottages are proposed to be built, but the urban district council refuse to pass the plans because the first-floor rooms are not 9ft. high over the whole area. I send a copy of the by-laws passed by the L.G.B. in March, 1902, referring to the heights of rooms. Do you think the council have power to compel me to build them 9ft. high. I contend they are well within the limits of the by-laws. They say that the first floor must be 9ft. high and that the 'room partly in the roof' portion of the by-law only refers to attics. What is my position, and what do you recommend me to do?"

This is only another instance of the ignorance and want of logic displayed by local officials. The bedrooms are clearly attics, and we think you have nothing to fear in building according to your plans.

Bloom on Varnish.

LONDON.—J. W. writes: "I have been executing some decorations, &c., at some chambers, amongst other items washing and varnishing work which had been previously varnished. Why is it that on some doors a blue tint or bloom should appear after about one month, while other doors and windows in the same room and under the same conditions remain free?"

Bloom on varnishes is generally due to condensation of moisture upon the surface before the varnish is hard. It can usually be removed by warmth, washing and rubbing briskly with warm water, or rubbing with a wad of wool and olive oil.

The Surveyors' Institution.

BIRMINGHAM.—X. writes: "Having passed the R.I.B.A. preliminary, I desire to pass some examinations so as to become a member of an institute of surveyors."

Write to the secretary of the Surveyors' Institution, Great George Street, Westminster.

Heating a Small Chapel.

WOLVERHAMPTON.—T. W. F. writes: "What size should a cast-iron saddle boiler be to efficiently heat a low-pressure hot-water system in a small chapel, with about 400ft. of 4in. pipe. The present boiler is 15ft. long and 2ft. wide, but the place has never been effectually heated, although I have calculated the heating surface of pipe to be more than sufficient for the cube capacity of the building. If other causes of the inefficiency of the system present themselves to you, or other forms of boiler, perhaps you will kindly make a few suggestions. The present system has been in about eleven years, and is used during the winter months only."

In selecting a boiler one should note the proportion of the weight of fuel its furnace

can contain and burn well to the total weight of water in pipes and radiators, and the proportion of heat-receiving surface in furnace and flues to heat-delivering surface on pipes and radiators. In the case given the height of the boiler is not stated, but it may be 20ins. and the water space 3ins. The boiler will then contain about 110 lbs. of water and 13 sq. ft. of surface (half of it being in the furnace), and the pipes about 2,200 lbs. of water and 420 sq. ft. of surface—proportions of about 1 to 11 and 1 to 33; and the gross furnace capacity is about 4 cub. ft., of which perhaps 2ft. will be filled with coke, weighing perhaps 80 lbs., when the ratio of fuel to water is 1 to 30. The fire-grate surface is $2\frac{1}{2}$ sq. ft., and its ratio to the pipe surface is 1 to 170, and to the weight of water 1 to 320. The ratio of grate surface and weight of fuel to weight of water are too small, and should be 1 to 600 and 1 to 20 respectively. The "saddle" form of boiler is good, but the conical upright cylinder or square is perhaps better. Take a cubic foot

of fuel, thus: 1 $\frac{5}{3}$. In the upright

boiler four sides (4 sq. ft.) are in actual contact with the boiler iron, and one shiving upwards. In a "saddle" boiler a large proportion of the ends, 2 and 4, is lost; and the flue surface is not as effective as the furnace is; but in a well-designed "saddle" it may make up for the loss. When designing or selecting a boiler it is easy to get confused among the proportions of the various parts, but that of the maximum weight of fuel the furnace can burn well to the total weight of water is always reliable; and that of the grate surface is almost as good. Before buying another boiler try whether the circulation is at fault; if the joints are made with gasket, feel along the pipes till a quick change of temperature is found, and then open that joint to pull out gasket that may be choking the pipe. See that the pipes rise or fall 1in. in 12ft. or 15ft.; a small wrought-iron pipe at the peak of the flow pipe to let out air may be all that is needed to quicken the current. If there are two or more flows, and these are not evenly heated, put a check valve in the hot one. It may be that the whole apparatus is sluggish, and full heat can only be obtained by lighting up on Friday instead of Saturday. In this case a larger boiler would be an aid. If these fail, the fault may be in (a) the brick flues, (b) the chimney, (c) the furnace, (d) the fireman. For (a) see that the smoke travels over all the shell of the boiler and has no short cut to the chimney. For (b) the chimney draught may be poor from being too high or too low, or being too small, but 9ins. by 9ins. is ample. A wider mouth chimney-pot may cure the case. If sweeping doors in outside walls are used, see that they are closed tightly, and if in doubt put in a plug to the inner space, or an inside door or shield at the flue edge of the opening to the door. For (c) get enough air through the bars, and clear out the ashpit to let air under the bars to the full extent. If new bars are needed, get a new pattern with bars $\frac{9}{16}$ in. wide, 3ins. deep and $\frac{7}{16}$ in. air spaces, cast in pairs; 8 or 10 holes, $\frac{1}{4}$ in. or $\frac{3}{8}$ in. diameter, drilled near the bottom of the furnace door for air over the fuel may be very useful if the fuel is thick on the bars. See that the damper does not slip back after being set, and open it wide when starting the fire. For (d) see that he is not charging the furnace too full; the flames must have ample room to leap and wave. Clean out clinker every day. If the ashpit be shallow draw out the ashes every time after firing; and a tray $1\frac{1}{2}$ ins. deep, filled with water, will be of great use to quench the dross and to supply vapour to keep the bars cool and free from clinker, and maintain the heat of the fuel.

O. WHEELER.

LARGE CENTRES.

THE design of large centres for arches and domes is of some importance in construction, and we illustrate an original design for a large centre by Professor Beresford Pite, F.R.I.B.A., which was used for the construction of the arches at the crossing of the nave and the transept at Christ Church, Brixton. The span of this is about 41ft. The details of the framing will be gathered from the illustration.

In the case of large centres the load is often transmitted to the ground by vertical supports, but in the present case this was not done, and the advantage in giving a clear space for traffic underneath is obvious. Sometimes with this desire for a clear way underneath the supports are inclined and are then apt to shrink and become loose-riding, on the dogs, and so throw themselves out of bearing. There is, however, another very important advantage in doing without the vertical supports in the case of arches, because if the weight is not put upon the footings during erection, when the centering is struck the sudden throwing of the weight upon the piers may cause the latter to settle unequally.

Of course during the construction of the arch the stresses in a centre are continually altering in direction and amount, and for this reason the centre has to be well braced. The method of bracing adopted in this particular case is notable.

It is usual to construct centres in position piece by piece, having previously fitted and marked them, rather than to build them complete on the ground and sling them into position with a crane, which would be liable to distort them.

Projections below the springing should be allowed for in designing centres, such as caps or neck mouldings, as these may prevent the lowering of the centre. In this case the centre is not diminished sufficiently to pass over the projections, but enough play is given.

The whole weight of any arch stone is not taken by centering until it is in such a position that a vertical line drawn through the centre of gravity of the stone passes on the outside of its bed. The load gradually increases from the springing of the crown during the construction of the arch, and in a semicircular arch when about half up between the springing and crown the load will have a tendency to force in the haunches and spring the crown up. For this reason the centre needs to be made stronger in the middle than on the haunches, as a greater weight will have to be carried by that part, while the stresses from the haunches where not supported from below has to be taken from the middle of the span by framing the feet of the haunch braces into the foot of the king-post, which will counteract the tendency of the latter to rise. The stress at the crown, which comes into play later, is generally taken by braces from the head of the king-post to the ends of the tie piece, directing the stress to the supports at the springing, as shown by the accompanying illustration.

ROAD-MAKING ON THE EMBANKMENT.

THE Embankment is once again "up," but on the present occasion the London County Council is carrying out an interesting experiment with a view to avoiding the necessity of such frequent repairs. Tar macadam is being put down, and good hopes are expected of it. When the old Metropolitan Board of Works started constructing the Embankment forty years ago the nett cost of the undertaking was, at the outset, £1,156,981. Few at that time could have had any idea of what the subsequent cost would be. No sooner was the work completed than the roadway subsided, and from that year to this something like

£15,000 a year has had to be spent in order to keep the road in a serviceable condition. The reason of this, after all, is not far to seek, says the "City Press": the Embankment was constructed on ground which for years had been nothing more than the mud flats of the Thames foreshore. The result of this continual drain for repairs has brought the actual cost of the Embankment up to something like £2,000,000. Time after time it has been levelled up with many hundreds of tons of granite, and no sooner is one part finished than another section is closed to

traffic. It has been suggested in some quarters that the London County Council should take the present opportunity of thoroughly repairing the Embankment and forming solid foundations in view of the likelihood of their overbridge tramways scheme meeting with success in the near future. Possibly the experiment is not altogether unconnected with this suggestion. Engineers generally are of opinion that more time must elapse before the evil of subsidence can be thoroughly overcome. Meanwhile hopes are centred in the tar macadam.

Keystones.

The A.A. Brown Book has just been issued.

The Reports on the "Auld Brig of Ayr" have been submitted to Sir William Arrol for opinion.

A new Roman Catholic Church at Holyrood, Barnsley, has been erected at a cost of £10,000. It accommodates 700 worshippers.

Eighteenth-century Door-heads—The titles to the top right-hand and bottom left-hand blocks on p. 164 of our issue for last week should be transposed.

Mr. F. Taylor, chief architect in the Public Works Department of the Orange River Colony, has been promoted to the office of Secretary for Public Works.

The Synagogue at Bayswater has been re-decorated from designs by Mr. Lewis Solomon, F.R.I.B.A. Improvements in the heating and ventilation of the building have also been carried out.

A Scottish School.—Messrs. Kerr & Watson, architects, have prepared plans for the Johnstone School Board for a new school to seat 730 pupils. Two designs have been submitted, estimated to cost £12,000 and £10,500 respectively.

The **Fine Bridge in Ireland** is now approaching completion above Dungarvan Station. It has a total length of 1,205ft., there being seven spans, one 110ft. The opening span for navigation is built on the American Scherzer rolling lift system, and is the second of its kind in Great Britain.

New City Hall, Cape Town.—A full description of the new City Hall of Cape Town, which was officially opened on July 25th last, is given in the August number of "The South African Master-Builders' Federation Journal." Messrs. Reid & Green, A.R.I.B.A., were the architects, and Messrs. Howard & Scott the contractors.

At Downside Abbey, near Bath, a new choir and chancel have been built from designs by Mr. Thomas Garner, who is known for his work on the reredos of St. Paul's and at King's College, Cambridge. The cost has been £16,500, and the work has been executed without contractors by local masons working under Dom Philip White-side, Procurator and Bursar of the Abbey.

The **Gladstone Memorial**, on a site just westwards of St. Clement Danes Church, Strand, will be unveiled on October 21st. It is of bronze, representing Mr. Gladstone in the robes of the Chancellor of the Exchequer, and will be placed on a pedestal with a 5ft. pavement around. Accessory statues and groups, also in bronze, are included in the monument, the total height of which will be 32ft. Mr. Thornycroft is the sculptor.

Birmingham Town Hall: Alterations practically completed.—The alterations to the interior of Birmingham Town Hall have been practically completed, and the building will be reopened within the next week or two. The improvement scheme has cost about £6,000. The orchestra has been completely reconstructed, more exits have been provided, and those existing improved, and staircases have been remodelled. Mr. Fred Martin is the architect in charge.

The **fifteenth-century Oak Rood Screen of Lanreath Church, Cornwall**, has been renovated and cleaned by Messrs. Harry Hems & Sons, of Exeter. After the paint had been removed, it was found that during the last century many parts of the screen had been extensively repaired and renewed in plaster-of-Paris and other cements. This has all been cleared away and the deficient parts made good in English oak, the *motif* for the new work having in every instance been closely copied from the old.

School Additions in Battersea.—Mr. Ryan-Tenison, F.R.I.B.A., has been instructed to carry out the new wing to the Battersea Grammar School and additions at Sir Walter St. John's Schools, Battersea.

Hector Macdonald Memorial.—The foundation-stone of this memorial, at Dingwall, was laid on Monday. The architect is Mr. James S. Kay, of Glasgow, his design having been selected in competition. The cost of the memorial will exceed £1,000.

Stones without Mortar.—The pinnacles on the tower of Stoke-on-Trent Church, which are now being dismantled to give place to a new design, consist of some stones weighing more than 20 cwts. each. These have been standing merely by their own weight, the mortar having perished.

Restoration of Bolton Percy Church.—For several weeks the church of All Saints', Bolton Percy, has been in the hands of workmen, who have been renovating and carrying out alterations in the interior under the direction of Mr. Bilson, F.S.A., of Hull. The work is now rapidly approaching completion.

The **Queen's Hall at Hull**, in Alfred Gelder Street, was opened recently. It accommodates 2,000 persons and has cost £23,000, the contract for the building being £19,521. The building is designed in the late Gothic style, and the front is carried out in Ancaster and Portland stone. Messrs. Gelder & Kitchen, of Hull, were the architects. The brickwork was executed by Mr. F. Beilby, the plastering by Mr. R. Metcalfe, the masonry by Messrs. Quibell, Son & Greenwood, the joinery by Messrs. R. Finch & Co., and the plumbing by Mr. W. G. Padgett—all of Hull.

Building Plots in the Bois de Boulogne: Paris up in Arms.—Paris is up in arms against the proposal that part of the Bois de Boulogne should be allotted for building purposes. This proposal is said to involve a diminution of the park by nearly 100 acres, the felling of more than 6,000 trees, and the construction of an entirely new residential quarter at the entrance to the Bois. The Paris Municipal Council, which has purchased from the State the part of the fortification and the glacis immediately adjoining the park, cannot, it is said, afford to leave it unproductive, and consequently proposes to divide it into building lots.

Leigh Hunt's Chelsea House.—A memorial tablet has been erected by the L.C.C. on No. 10, Upper Cheyne Row. Leigh Hunt lived there from 1833 to 1840; indeed, his residences in London numbered nearly a score, but at most of them his stay was of brief duration. The Council had come to the conclusion that No. 32, Edwards Square, Kensington, where Hunt lived from 1840 to 1851, had the strongest claims to indication, but it was ascertained that this house would in all probability be demolished within the next few years, and in these circumstances the house in Upper Cheyne Row was selected. It has not been rebuilt or substantially altered since the date of Hunt's residence.

Mr. Francis T. Verity, F.R.I.B.A., the architect to the Lord Chamberlain, who has virtually been given a free hand by the directorate of the Empire in the reconstruction and re-decoration of that theatre, has been faced with the difficulty as regards the decoration, which had to be gorgeous without being gaudy. Early in October the public will be able to judge his work. The "grid" at the Empire has been raised to twice the height it was before, and the width from fly rail to fly rail is now 70ft., thus providing a stage capable of presenting the most complicated and elaborate spectacular display. The new act drop is by Mr. Joseph Harker.

Mr. Jasper J. Kelf, architect and surveyor, has discontinued his local offices at Walthamstow and Leytonstone, and is centralizing his business at Devonshire Chambers, 15 to 18, Bishopsgate Street Without, E.C.

The Austrian Exhibition.—Professor Fabiani, architect, is visiting London this month to make the final arrangements for the exhibition of Austrian products and manufactures which is to be held here next year.

A new Female Infirmary in connection with the Knaresborough Workhouse is being built at a cost of £5,000 from designs by Mr. J. Houfe, architect, of Harrogate. Provision will be made for thirty beds, day-rooms and nurses' accommodation.

A new Process for Stained-glass Windows has been introduced by Messrs. W. Meikle & Son, of Glasgow. A memorial window for the chancel of the new Monkland parish church is completed, the work being carried out without any surface pigment.

The Carnegie Trust in Dunfermline, which was set on foot by the munificence of the American millionaire, is to hold classes in architecture. Mr. Fairburn, of the Edinburgh School of Applied Art, is one of the instructors, and there is also to be a visiting lecturer.

A window from Westminster Abbey offered for Cape Town Cathedral.—The old "rose" window in the south transept of Westminster Abbey—the "Poets' Corner"—which was removed and packed up three years ago to make way for the memorial to the Duke of Westminster, has been offered to the Dean and Chapter of Cape Town for the cathedral now being built in that city. The window was put into the Abbey by the Dean and Chapter in 1840.

A Richly-carved and Traceried Screen of English oak has just been fixed in the chancel aisle of All Saints' Church, Weston, Bath. It was designed by Messrs. E. H. Harbottle & Son, of Exeter, who were also the architects for the rebuilding of the transepts and east portion of the chancel. The screen has been carried out by Messrs. Dart & Francis, Ltd., of the Ecclesiastical Art Works, Crediton, who also fixed the new chancel screen about four years ago to designs by the same architects.

The Hampton Sewerage and Sewage-disposal Works were visited last Wednesday by the Society of Engineers. Owing to the geographical configuration and contour of the neighbourhood, and to the presence of large water mains in the principal roads, the district presented exceptional difficulties with regard to the construction of sewers, and it was found necessary to employ intermediate lifts. Ultimately the Shone system of collecting and delivering the sewage was proposed and carried out.

The Extension of the Wholesale Markets at Brentford, of which the memorial stone was laid by Mr. Leopold Rothschild last week, is being carried out from designs by Mr. Nowell Parr, engineer and surveyor, and is to cost by contract £43,000. The markets will be divided into three covered ways or avenues. The central avenue is to be devoted exclusively to wagon stands—twenty-three double and thirty-six single—and the two side avenues will have corresponding spaces for the display of merchandise. Along the main walls, on the north and south sides of the markets, thirty-three shops with 15ft. frontages are to be constructed.

The London County Council's Central School of Arts and Crafts has now entered upon the tenth year of its career. During the past session 769 individual students were enrolled, mainly apprentices or journeymen in artistic trades, this number being an advance upon previous records. The school provides at nominal fees

practical instruction by specialist teachers in a wide range of handicrafts, grouped generally into (a) architecture, furniture, decoration, (b) silversmithing and kindred trades, (c) bookbinding and other crafts of book production. Pending the completion of the permanent building in Southampton Row, additional temporary premises are being equipped to meet the increasing demand. New classes are being formed in building construction, painting in tempera, &c. Prospectus and full particulars can be had on application to the Curator at the School, 316, Regent Street, W.

Partnership.—Mr. E. Jenkin Williams, F.R.I.B.A., of 17, Quay Street, Cardiff, has opened a London office at 30, John Street, Bedford Row, W.C., and taken into partnership Mr. H. Parry Morgan, who has been engaged in his office for several years. The practice will be carried on under the title of E. Jenkin Williams & H. Parry Morgan.

A new London Chimney is being built at the Blackfriars Power Station, in Upper Ground Street, by the Alphons Custodis Chimney Construction Co. When finished it will be 180ft. high, the inside diameter at the top being 8ft. 6ins. Though the biggest chimneys in the world are in London—at the Chelsea generating station—the highest is the "Hallsbrucker Hutte," in Saxony, which is 460ft.; while the tallest stack in America is 365ft. high. In London the tallest chimney is one, built of steel, which is to be seen on the way from Hammersmith to Kew Bridge. It belongs to the United Tramways Co., and is 300ft. high.

The new Post-Office.—The foundation-stone of the new post-office building on the site of Christ's Hospital will be laid by the King on Monday, October 16th. Generally speaking, it will replace the old east building at St. Martin's-le-Grand, which was designed by Smirke, completed in 1829, and is now considered by the post-office authorities to be unfit for their present work. The architect of the new office is Sir Henry Tanner, of the Office of Works. The clerk of the works will be Mr. Leak. As yet tenders for the building have not been accepted, or, if preliminaries have been arranged, contracts have not up to now been officially announced. It is understood that the new structure will preserve some of the leading characteristics of the old east building. The foundation work is in the hands of Messrs. Mowlem. It is expected that the cost of the new offices, when complete, will be about £250,000.

New Central Baths at Bradford have been erected at a cost of £7,000. Mr. A. Hessel Tiltman, F.R.I.B.A., of London, designed the building, which has been carried out, with modifications, by Mr. F. E. P. Edwards, the city architect of Bradford. The principal accommodation provided is a large swimming-bath, a series of slipper, douche and medicated baths, and Turkish and Russian baths. The usual method of surrounding the swimming-bath with dressing boxes has been abandoned, and a special apartment for dressing-rooms provided. The bath hall when turned into a hall for meetings will provide seating accommodation on the floor for 860 persons, with 680 in the galleries—in all 1,540. In the adjoining apartment the dressing-boxes are removable, and when taken down in the winter will leave a room 55ft. 6ins. by 30ft. 9ins. The building is ventilated on the plenum system, and the swimming hall is lighted with "Lucas" gas lamps, electricity being the illuminant for the special baths. The medicated baths are provided in a self-contained suite of rooms 38ft. 6ins. by 16ft., and include dowsing radiant heat and light baths, "colarium" or electric sun bath, electric massage, electric slipper bath, medicated slipper bath, vapour bath, &c.

Builders' Notes.

The Bradford Stone Trade is reported to be very depressed. Prices are said to have been never so low as they are just now, and several large quarry-owners whose yards are stocked to overflowing have been compelled to stop getting.

A Huge Quarry Blast took place recently at the Dinorwic slate quarries, Llanberis, where an enormous body of rock was impeding the development of a certain portion of the site. Ten shafts, each 32ft. deep, were bored and charged with 4 tons of Nobel's explosive gelatine, the firing being effected by a fifteen minutes' time fuse connected with detonators which fired an instantaneous fuse.

The Trade in Galvanized Sheets.—On Tuesday last week galvanized sheet-makers at their London meeting quoted a further advance of 5s., making the minimum price of 24-gauge corrugated £11 5s. per ton, which means that orders cannot be placed under £11 10s., and several works ask £11 15s., marking a rise of £2 on the low figures of last winter. Spelter is also £3 above the lowest price, which increases by about 17s. 6d. the working cost for galvanized sheets. There is no sign of the higher prices checking demand. The activity is said to be unprecedented.

Tests between Swedish and Italian Marble.—In order to ascertain the advantage of "Ringborg green" marble compared with "Blanc clair" Carrara marble when the material is used where rubbing (wear) takes place, as in the case of flooring, steps, &c., the Nya Marmorbruksaktiebolaget of Norrköping have had rubbing tests made at the Chalmer's Institute on these two kinds of marble. The result, given by the table at the foot of this page, shows that after 200 revolutions and a load of 30 kilos the average wear of the "Ringborg green" marble amounted to 53 grammes, whilst the wear of the Carrara "Blanc clair" marble at the same test was as much as 64.3 grammes. The Swedish "Ringborg green" marble has consequently shown itself to be about 20 per cent. superior for wear than the Italian "Blanc clair" marble.

A Patent Centering.—Mr. W. H. Barton, of 10, Pendarves Road, Wimbledon, has taken out a patent for providing a means whereby centering to support concrete floors during setting is dispensed with. He employs steel wire or strips wound round the joists and running between them parallel to the lower surface of the floor. Upon these wires or strips are placed sheets of thin metal or other material, with the edges overlapping. This forms the centering. When the concrete has set, the wires may be cut and drawn out, leaving the centering free for removal, or the whole may be left in position. The inventor claims that his device not only effects a considerable saving in prime cost and cartage, as compared with ordinary wood

centering, but, the necessity for struts being avoided, a clear floor-place is obtained during building operations.

Birkenhead Building Dispute: Arbitrator's Award.—The Board of Trade "Labour Gazette" states that Mr. A. A. Hudson, the arbitrator appointed to deal with certain matters in dispute between the Birkenhead and Wirral Building Trades Employers' Association and the Birkenhead and District Operative Carpenters and Joiners', Bricklayers' and Stonemasons' Societies respectively, has issued his award. The principal differences between the parties arose out of the employers' proposal that in winter the men should have breakfast before coming to work. The employers desired that the hours of work in winter should be reduced, and had proposed that the summer period should be extended and the winter period reduced, so that the aggregate hours worked through the year should not be materially reduced, but that the men should breakfast before starting. The arbitrator rejected the proposal that the men should breakfast before starting. He awarded in each case that the winter period, which formerly was from November 1st to the end of February, should be the six weeks before and the six weeks after Christmas, and that the winter working hours should be forty-two and a half a week (instead of forty-seven as formerly), the starting time being changed from 7 a.m. to 7.45 a.m. in this period. The award also dealt with other points which were of less importance.

Obituary.

Mr. John L. Black, sole partner in the firm of Messrs. Alexander Black & Son, builders, Carnoustie, died recently.

Mr. G. S. Fleetwood, of Messrs. Fleetwood & Sons & Eversden, surveyors, New Court, Carey Street, London, was found drowned at Herne Bay on Thursday last.

Count Sacconi, the architect of the national memorial to King Victor Emmanuel, now nearing completion, on the Capitoline Hill at Rome, died suddenly at Pistoia last Sunday.

Mr. W. G. Scott, head of the firm of Messrs. W. G. Scott & Co., architects and surveyors, of Workington, who died on April 29th last, aged 67 years, left estate which has been proved at £5,080 gross.

The late Mr. Alfred Waterhouse, R.A., died worth £163,575. He bequeathed Yattendon Court to his widow, with an annuity of £3,000 a year and the income of a special fund. Subject to her interest, the property is devised to the testator's eldest son, Mr. Paul Waterhouse, for life and to his sons in tail. After certain pecuniary legacies to relatives and to pupils and assistants, the residue of the estate is divided among the testator's four children in the proportion of one share to the eldest son and two shares each to his brother and sisters.

Comparative rubbing test between "Ringborg green" and Italian "Blanc clair" marble.

No.	Test piece.			Specific gravity.	Load, kilos.	Wear (rubbing off) after 200 revolutions with 35 cm. radius.		Wear, reduced to 49 cm. radius.

This house has been built of pressed red bricks, rough-cast, and tiled roof, from designs by Mr. James Cocker, architect and surveyor, of Altrincham. It occupies a commanding site.

AMERICAN ADDRESSES.

AN elegant reprint has just reached us from Washington giving the addresses delivered at the annual dinner of the American Institute of Architects at the beginning of this year. Dinner speeches on architecture do not often form good reading, however much the *bon mots* may be appreciated after the dessert, but in the present instance quite a number of interesting remarks seem to have been made. Mr. Roosevelt was there, but his speech was of no particular moment, its theme being the familiar one about having important Government work carried out steadily, to a plan devised by a body of capable men. Dr. Butler, president of Columbia University, followed with a speech on the place of art in civilization. "We are," he said, "a young people and art is old. To the country of Inigo Jones and Wren and Vanbrugh we owe much, for it is a country of home-builders of extraordinary excellence and skill. To the great exemplars of the Gothic, wherever found, we owe much. To the fine imagination, delicate technique and the broad architectural scholarship of the French we owe still more. But back of all we go, and must always go, to the eternal well-springs that were fed by the genius of Greece and Rome. It was given to them to create the highest standards of excellence alike in architecture, in sculpture and in letters, and to those standards it has been the effort of all intelligence ever since to conform. In this movement France has pointed the way for all of us. . . . The Ecole des Beaux-Arts has influenced us mightily. Of our earlier giants Richard Hunt and Richardson

came under its influence,* and the name of those who have followed them is legion. It was a Frenchman who took so large a part in the decoration of the public library at Boston, and it was a Frenchman who planned this capitol city with all its infinite possibilities of beauty, and who, at Hamilton's invitation, directed the laying-out of a typical industrial centre which national legislation was to foster and build up. . . . It is my privilege to present to this company His Excellency the French Ambassador."

The French Ambassador in the course of his reply asked how it was that French art had survived throughout the years and was so vital and alive in all its branches to-day. "Because it is alive in all the nation. The thing which is most important is that the artists are not enough; you must have the nation with you. . . . The French people of the poorer class are asked what they think. No great change is introduced in our architectural arrangements without giving the people an opportunity to see it and express their feelings. When there was a question of changing the Arc de l'Etoile by placing a group of statuary on its summit a model was made at great expense and placed in position

* A competent critic has furnished this note: "Hunt was the first American student to enter the Ecole des Beaux-Arts; Richardson the third. Hunt was the pioneer, the ice-breaker, the dean of our profession. He had been in Paris for years when Richardson arrived. Richardson was a strong and able man, an artist and a man of genius. On leaving Paris, early in life, he quarrelled with his classic *alma mater*; and being impatient of her methods, which he found too slow and laborious, he coined for himself a style eclectic, personal and romantic—Gothic in spirit, Romanesque in detail—robust, virile, ingenious, but wholly barbaric; remarkable for its absence of proportion and sense of real beauty; in the hands of his followers lawless, and now happily extinct."

for several months in order that the people might see the effect of the proposed alteration. They thought that it was better to remove the statues, and they were removed. For this cause all our museums are thrown open to all comers. . . . The same is true with our competitions. The exhibition of the competitive work for the Prix de Rome is open to all comers; the award is rendered by the highest authorities, members of the Institute; but the people's opinion is of importance. . . ."

Cardinal Gibbons dealt with "Art and Religion," but as that is a subject on which so much has been said at one time and another we pass it by, simply noting that His Eminence managed to drag in General Sheridan's joke about the pension office at Washington. "That building," he said, "has only one defect. It is fireproof."

The rest of the speakers, though distinguished men, said nothing which is worth recording for the benefit of English readers: but the foregoing is interesting as an indication of the growth and outlook of American architecture.

Sculpture at Liverpool.—In consequence of the inability of the Liverpool Arts Committee to comply with certain stipulations of the newly-formed Society of British Sculptors, there has been a kind of boycott of the thirty-fifth autumn exhibition of modern art, organized by the corporation and now open, by many distinguished sculptors. Notwithstanding these conspicuous abstentions, there is in the exhibition a fairly good selection of chisel-work, notably a brilliant example by Rodin.

OLD NORMANDY.

PERHAPS one of the oldest and most interesting towns in Normandy is Lisieux, full of quaint, narrow streets and picturesque groups of timber houses. Some of the finest of these latter are found in the Rue aux Fèvres, a delightful old street where neighbours can easily shake hands from the upper windows of some of the houses. Writing of Lisieux Mr. Percy Dearmer says: "In the Rue aux Fèvres we seem to be back in the Middle Ages; old houses nod across the narrow streets to each other, and children in their black blouses run in and out of the dark recesses. But how fallen is the street from its former glories! Old towns, with all their beauty, were doubtless not very clean; but the Rue aux Fèvres was not the filthy crumbling place it is now in the days when well-to-do burgesses lived in it and swept its doorways with their their costly gowns."

The splendid colour of these buildings, with the dark brown of the timbering and the yellowish green and red plasterwork, and the tumble-down brown and red tile roofs, is delightful.

The church of St. Pierre has a grand position in the large square of the town, and is a fine example of the early French style.

The church of St. Jacques (1496-1540) is also interesting. It is built on the natural slope of the ground, so that you walk uphill from the west door to the choir. The tower has not been completed, and the rather picturesque temporary roof covered with black slates still exists, while the painted decorations of the ceilings are in excellent preservation, having been discovered a short time ago under a heavy coat of whitewash.

About seven miles north west of Caen is the small village of Bretteville-Norrey, which can boast of an excellent church, built in the Early English period with a fine spire and open belfry and a most interesting north porch. Internally there is a sense of grandeur in the size and elegant proportions of the church, and there are many beautiful carvings. Externally, on either side of the chancel wall, rise two colombiers, or pigeon houses, the existence of which seem to indicate that this church originally belonged to the Abbey of Ardenne.

Competitions.

Schools, Newcastle.—Mr. Arnold Mitchell, F.R.I.B.A., will be the assessor in the competition for new schools in Bolam Street, Newcastle-on-Tyne.

New School at Reddish.—The competition for a new school at Reddish for the Stockport Education Committee has been decided as follows:—First premium, Messrs. Cheers & Smith, Blackburn; 2nd, Messrs. Winder & Taylor, Oldham; 3rd, Messrs. Adshead & Holt, Manchester. Mr. John W. Simpson, F.R.I.B.A., was the assessor.

OUR PLATES.

THE walls and ceiling of the interior of the council-chamber in Cardiff Town Hall are of painted plaster, and the panelling and seating of oak, with Italian marble columns. The seating accommodation is arranged in three tiers one above the other, while in addition to the lights shown in the illustration the room is lighted by a large side window, the glass of which it is proposed to fill with an architectural and allegorical design. Behind the Mayor's chair there is a recess, partially screened to form an anti-face. The opposite side of the chamber is occupied with the public gallery.

The council-chamber at Deptford is planned squarely, and is of considerably smaller dimensions than that at Cardiff. The building was opened a short time ago.

HOLLOW TERRA-COTTA PARTITIONS.

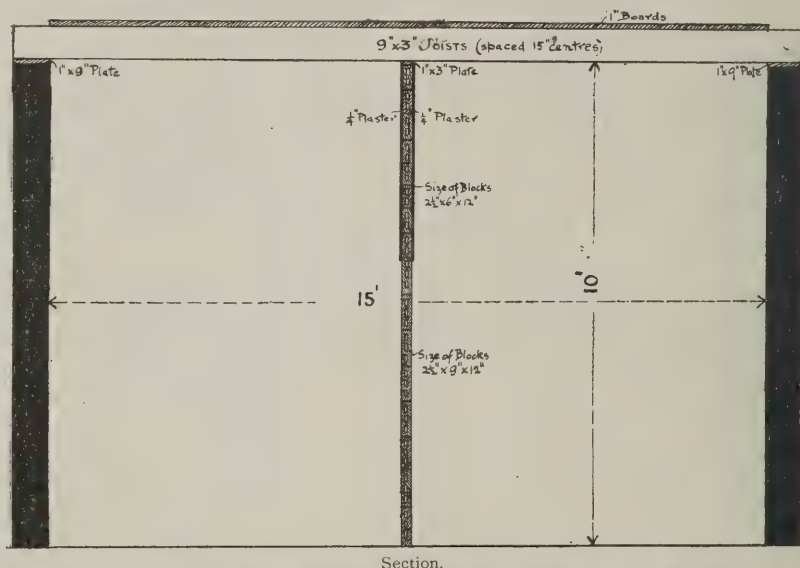

A Test to Determine their Strength.

WE publish herewith particulars and illustrations of a test recently carried out under our direction with the object of ascertaining the ability of a partition constructed of hollow terra-cotta fireproof blocks to sustain ordinary loads such as may be expected in practice. This test was on blocks manufactured by the Hempstead Patent Brick Co. at their works near Hemel Hempstead, Herts.

An office had been erected measuring 16ft. 6ins. by 12ft. 6ins. outside, or 15ft. by 11ft. inside, constructed as shown by the accompanying drawings and photographs, and across the middle a partition 10ft. high was erected with 2½in. bricks tailing in every other course in a chase in the brick walls on each side. A little over half the partition was constructed of blocks measuring 6ins. by 12ins. by 2½ins. thick, while the remaining top portion was constructed of blocks measuring 6ins. by 12ins. by 2½ins. thick. This latter portion was plastered on each side with ½in. of plaster made of liaslime and ashes; which was done for effect so as to show the finished surface ordinarily

given. The omission below was with the object of affording no ulterior support to the blocks. Joists gins. by 3ins., spaced 15ins. from centre to centre, were placed on wall-plates as shown in the section, and a plate 3ins. by 1in. was placed on the partition so as to distribute the weight equally. Boards 1in. thick were placed on the joists to allow the load to be put on.

The detail shows how these partition blocks are made hollow with three cavities in the 6in. blocks and two in the 12in. blocks. The mortar keys into these cavities, as shown in the detail, and a groove on the bed gives additional stability. The mortar used in this test partition was of crushed brick and Portland cement, in the proportion of 3 to 1. The remarkable resistance these blocks offer to very high temperature was dealt with in our issue for August 24th, 1904, in a report of a private fire test carried out specially for our particular information. The blocks weigh only 105 lbs. per yard, so that a partition is very light. It will be seen from the detail that the amount of material resisting stress in a block, taken at the weakest point, consists of two ¾in. skins, thus giving 1½ins. per inch run. The webs, however, give considerable stiffness and add strength.

THE TEST BUILDING WITH HOLLOW TERRA-COTTA BLOCK PARTITION.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

In considering the amount of the load to which this partition should be subjected for a thorough proof of its reliability for general use in buildings we kept in view the following points:—A partition might be required to sustain the load from floor joists resting thereon and stretching from both sides. A partition thus loaded would be erected across a building in a similar manner to that in this test, namely, between the front and back walls of a building. It would be unfair to expect a partition of this small thickness to sustain loads in buildings other than the domestic class, or in the smaller offices in commercial buildings and schools, &c., and the size of most rooms would not exceed 12ft. by 20ft.; in such a case the joists, of course, would run the short way, namely, the 12ft. span. If rooms of a larger span were required it would be only fair to expect a heavier partition to be required. In fact, most builders would be chary of resting joists of this span upon a 4½in. solid brick partition. The load in a dwelling never exceeds 40 lbs. per sq. ft., and in schoolrooms 50 lbs. per sq. ft. is reckoned ample. These two factors, then, were taken

DETAIL OF CONSTRUCTION OF THE PARTITION.

as the limit, namely, a 12ft. span and a load of 50 lbs. per ft. super. The joists in such a case would not be continuous over the partition; and as the continuity of the joists increases the load on the central support by one-fourth, or 25 per cent., and reduces the load on the end supports by one-eighth each, the load in the test had to be correspondingly reduced. The desire being to introduce in the partition a stress equal to a load of 50 lbs. per ft. super. on joists of 12ft. span coming in from both sides, required that the load on a span of 7ft. 6ins. should be increased. As it is the practice of most engineers to allow a factor of safety of 10 in a brick wall, we thought it desirable to test the partition with a similar factor of safety, so as to leave no possibility of criticism, although we are inclined to think that such a large factor of safety is excessive because the load would seldom reach the maximum, and then not be continued for long.

On two 12ft. spans with a factor of safety of 10 the load on the partition would be $12 \times 50 \times 10 = 6,000$ lbs. per ft. run, or 500 lbs. per ft. super. on the floor. On two 7ft. 6in. spans with continuous joists in order to induce the same stress in the partition a load of 640 lbs. per ft. super. would be required. The floor was thus loaded without any difference being noticeable. When the load was removed it was found that both the joists and wall-plate over the partition were indented $\frac{3}{16}$ in. where they had rested against each other. The bricks used for giving the load weighed 7 lbs., some being an ounce under. Therefore the bricks were piled twenty-six courses high. As there are thirty-two bricks in each course to the yard, it will be seen the load was not under weight, and as it rained

2-IN. HOLLOW TERRA-COTTA PARTITION SUSTAINING DISTRIBUTED FLOOR LOAD OF 640 LBS. PER FOOT SUPER.

heavily for two days after the load had been applied the bricks must have gained considerably in weight.

When it is recollected that the amount of material resisting compressive stress is, as stated above, 1½ins. per inch run it will be seen how remarkable is the result, because with the load applied the stress per inch run was 625 lbs. Thus there was a fibre stress of 417 lbs. per sq. in. in the partition blocks at their weakest points. In the 1897 tests by the Royal Institute of British Architects walls of stock bricks built in lime-mortar crushed at a load of 290 lbs. per sq. in., and these partition blocks are porous terra-cotta capable of taking a nail. The 3in. partition blocks manufactured by the company give nearly double the area, so it may be anticipated that

these would take the heaviest load over the largest span likely to be met with in practice.

It will be seen, therefore, that these 2½in. partition blocks can be used with safety for ordinary rooms in houses, &c., and the ample factor of safety of 10 will allow for any possibility of inferior workmanship (although in this case the work was not out of the ordinary), and for differences of design. The height of 10ft. is as much as can be expected in ordinary rooms, and the factor of safety would allow for an increase in this direction also.

A German Garden City.—A syndicate has been formed to lay out a "garden city" at Wohldorf, a picturesque spot near Hamburg.

VIEW OF PARTITION SUSTAINING LOAD.

This house has recently been erected. The lower portion of the walls up to the window sills is faced with local grey stools with red quoins and patterns worked in; above this the facing is rough-cast. The roof is covered with hand-made tiles. The windows have Gibbons's steel casements and are fitted with plain lead glazing by Messrs. J. Chater & Sons. The staircase and screen are of oak, and the hall is panelled with oak to the height of 6ft. 6ins. Messrs. Tompsett & Co. were the builders and Mr. W. H. Ansell, A.R.I.B.A., of London, was the architect. The above view shows the garden front.

HOUSE AT FARNHAM SURREY. W. H. ANSELL, A.R.I.B.A.,
ARCHITECT.

THEORY OF SHEARING STRESSES IN MASONRY.

WHILE the action of shearing stresses in metals has been as fully recognized as that of tension and compression since the establishment of the theory of stresses in solid bodies, they have had practically no place in the rational treatment of masonry structures until the theory and tests of reinforced concrete beams compelled their recognition. In such masonry masses as suspension bridge anchorages, abutments of arches and even in retaining walls shearing stresses must always exist, and sometimes with comparatively high intensities. The same observation is certainly not less applicable to some portions of high masonry dams. In the latter case shearing stresses have always been allowed for under the head of "friction." In most of the standard treatments of high masonry dams one of the prominent conditions of stability has generally been so stated as to indicate that at no horizontal section of the dam shall the obliquity of the resultant pressure ever be greater than the angle of repose of masonry on masonry, the tangent of that angle being prescribed at about 0.6. Although that has been a general feature of practice in this particular line of construction it is thoroughly irrational, and it is rather strange that so many engineers have sanctioned it. As a matter of fact there is no horizontal joint in any properly built high masonry dam, and consequently there can be no possible action of friction until such a joint is made. Hence, before friction can act, an

approximately horizontal joint or surface of action must be made by shearing the masonry along that surface. The actual condition resulting from that provision of a specification is the virtual requirement that masonry shall possess a shearing resistance not less than about 0.6 of the resultant normal pressure, and there is little or no first-class masonry used in high masonry dams at the present time which will not fully meet this requirement.

The Idea Scouted.

In spite of these conditions a considerable number of engineers experienced in large masonry works have, in the past, not only declined to recognize the shearing resistance of masonry, but have asserted that its existence was too uncertain to make it desirable to give it any value. No less an authority than the late Mr. G. Bouscareau, about ten years ago, treated with contemptuous jocularly the suggestion that shearing should be considered in a mass of anchorage masonry for a proposed large stiffened suspension bridge. Yet it may be stated with perfect truthfulness and without the least exaggeration that no mass of masonry, and especially no plain or reinforced concrete beam, could stand under severe duty unless its shearing resistance were a large proportion of its compression resistance.

There are few tests of either natural or artificial stone in compression whose results do not furnish a remarkably accurate basis for computing the ultimate shearing resistance. Indeed, the so-called failures by compression of cubical or cylindrical test

specimens of nearly all good building stones, whether natural or artificial, are actually shearing failures. Those who have conducted compression tests of stone have many times observed the interesting forms in which the fragments are separated in the fractured specimens. Wedge-shaped pieces are usually sheared off along planes making angles of about 45 degs. with the direction of the applied loads, precisely as the theory of stresses in solid bodies indicates that they should. The manner of holding test pieces prevents these shearing planes from making the exact angle of 45 degs., which theory indicates to be the angle of maximum shearing intensity, but the divergence is small. The crucial fact is the failure by shear, although the maximum test load is recorded in pounds per square inch of compression. It is this persistent neglect to record the failure under its true name which has so long obscured the perfectly obvious action of shearing stresses in masonry.

Demonstration by Analysis.

The primary principles of analysis of tension and compression in any material indicate that shearing stresses exist with varying intensities throughout the entire volume of the piece. An analysis equally clear and but little less simple demonstrates that shearing stresses also exist throughout the entire mass of a beam carrying a transverse load. In other words, every masonry beam, including those of natural stone or concrete, whether reinforced or not, must frequently sustain shearing stresses of comparatively high intensity. At the ends of simple supported beams these intensities of shear are sometimes so high that they cause failure. In some recent tests of reinforced concrete beams this failure by end shearing was stated to be a failure by compression in the authentic accounts of the tests. The prevailing obscurity as to shearing stresses in masonry led to erroneous views as to the cause of failure, and the statement was fortified by the observation that the pulverization of the failed material proved the failure to be one of compression. A little experience only is required in testing blocks or cylinders of stone to show that the failed material is always finely divided along the plane or surface of ultimate shearing. The movement of two masses of stone on each other along a sheared surface is bound to pulverize the material. If the stone is weak there may be a large amount of the pulverized material, and often the greater part of the test specimen is demoralized in this manner.

Furthermore, it is known that the neutral surface of a bent beam is subjected to the greatest intensity of shear in the entire beam, that intensity having its maximum value at the ends. Every section of the beam parallel to the neutral surface is also subjected to shear, but with a less intensity than that of the neutral surface. Finally, every transverse section of a concrete beam is subjected to a shear with an intensity at the neutral axis equal to one and a half times the mean.

Conclusions.

These considerations show conclusively that the shearing stresses in every masonry mass and in every stone or concrete beam play a part not less important than that of the compressive stresses. They show, further, that the intensities of these shearing stresses may be subject to computations practically as exact as those which determine compressive intensities. It is obvious, therefore, that the ultimate shearing resistances of various grades of masonry and stone should be as carefully determined by tests as those of compression, and, finally, that the consideration of shearing stresses should govern the design of masonry structures with just as much force and completeness as the consideration of the stresses of compression.—"Engineering Record."

CONTENTS OF THE SEPTEMBER NUMBER.

- ENGLISH LEAD PIPE-HEADS. II. Lawrence Weaver, F.S.A. With 14 Illustrations.
- THE RESEARCHES OF MR. WILLIAM HENRY GOODYEAR. L. Ingleby Wood. With Three Illustrations.
- THE CHEAP COTTAGES EXHIBITION. I. H. Kempton Dyson. With Four Illustrations.
- THE PEACE PALACE AT THE HAGUE. Conditions, Plan, and View of the Site. Illustrated.
- A SKETCH OF IRISH ECCLESIASTICAL ARCHITECTURE. III.—Vaults, Arches, and Chancels. A. C. Champneys. With 16 Illustrations.

- THE OWNERSHIP OF ARCHITECTS' PLANS. A. F. Topham, Barrister-at-Law.
- CURRENT ARCHITECTURE. With 19 Illustrations—
- "Redcourt," Haslemere. Ernest Newton, Architect.
- A Week-end Cottage, Great Missenden. Timothy Honnor, Architect.
- Holy Trinity Church, Kensington. G. F. Bodley, R.A., Architect.
- Panelling and Carving formerly in Winchester College Chapel; now fitted in the Hall at Hursley Park. Attributed to Grinling Gibbons.

TECHNICAL JOURNALS, Ltd., Great New Street, Fetter Lane, E.C.

Trade and Craft.

Obstruction in Drains.

Everyone knows the trouble that is constantly caused by the stoppage of drains, due to the introduction of foreign matter, the ignorance of the British public being very great on this subject, especially among the lower classes. Such articles as stones, bricks, brushes, tins, ashes, &c., are frequently emptied down the drains. The method often adopted by the workmen employed by small builders is to use a plunger pump, which, instead of repairing the mischief by the removal of the object, often makes matters worse by forcing the obstruction further down the pipe or drain, until finally it becomes choked altogether, and nothing can then be done but to take up the drain or cut away the portion of the pipe affected. Messrs. Burn Brothers, of 3, Blackfriars Road, and 6A, Stamford Street, S.E., sell a very useful implement which is greatly in advance of the ordinary plunger. This is Cooper's patent suction and vacuum pump, which will suck foreign matter away in a surprising manner. Anything that can pass down the drain can be withdrawn by this pump, which cannot be used as a plunger. The pump is operated by short rapid strokes, so that the periphery on the rubber sucker is not raised from the surface surrounding the orifice of the gully, pipe or waste under treatment. To clear a pipe the pump is placed upon the opening and covered with water. If there is a ventilating pipe it must be temporarily plugged. It is a very useful addition to the many admirable appliances made by Messrs. Burn Brothers for the testing and clearing of drains, for which this firm has achieved a reputation. Two other interesting appliances have recently been placed on the market by Messrs. Burn Brothers, namely, the Ridgeless patent spring pipe bender, upon which lead pipes can be dressed without forming spiral ridges on the bore, which cannot be done without damage on a spring formed of round section wire. The other appliance is the Ferret patent spring drain cleaner, which consists of spirally wound wire that is very flexible and yet stiff enough to remove obstructions easily.

"True-scale" Reproductions of Drawings.

Side by side with the old blue print which once held an exclusive position in architects' and engineers' offices a number of other processes have come into vogue. They are not new processes, but well-known ones which have been exploited by trade firms in response to the demand for facsimiles of drawings. Each of these processes has its merits and defects, either as regards the quality of the result or the cost of it, but it is not our intention now to attempt any comparison of them, as some months ago we went carefully into the matter and fully described the features, methods of working and cost of the several kinds of prints. For the moment we wish to draw attention to the process of which Messrs. Vincent Brooks, Day & Son, Ltd., make a speciality. This is called "True-scale" photo-lithography, and its particular merit is, as the name implies, the absolute exactness in scale which is secured; while, being in printing ink, the copies are quite permanent. In these matters we see no reason why trade firms should foster secrecy about their methods and cloak them round with mysterious phraseology. As far as we know this "True-scale" process is nothing more than photo-lithography on aluminium instead of on stone; the use of the aluminium being a matter of convenience to the printers rather than effecting any improvement in the print; but we understand that instead of the usual transfer the sensitized aluminium sheet is printed upon through a paper negative of the original, and this is where the special merit of the process comes in, for the print is not wetted in any way,
